

# WebDET v1.3.1 Known Issues

The following table provides details on release functionality in terms of known defects and how to recover when encountered.

Defect	Symptoms/Workaround
<p>"System Error" Message</p> <p><i>(less severe form)</i></p>	<p>This form of the error could be generated from any part of the application at any time. If encountered, please hit back or refresh and try again. You should then be able to continue with your workflow and will probably not experience any side effects from this error other than having to redo your last transaction.</p>
<p><i>(more severe form)</i></p>	<p>This form of the error seems to happen most frequently on the Stands and Compartments pages, although it has been seen rarely on other pages with maps such as Points &amp; Lines. If encountered, please hit back or refresh and try again.</p> <p>If you are selecting features, it may appear that nothing at all happens. Once you continue on with your workflow, you may notice that the map has turned blue and lost the base maps (Imagery, Topo, etc.). You may also notice that the selection tool no longer functions as expected and keeps features highlighted that are not really selected. <b>(See image below for example.)</b></p> <p>Also, you may notice more frequent errors after this happens such as having trouble outputting a Stewardship Plan report or editing features. <b>If you experience this kind of behavior alert the national administrator that the ArcGIS Server map service needs to be restarted.</b></p> <p><u>National Administrator:</u></p> <p><a href="#">Cindy M. Barnett</a> - (304) 285.1568</p>
