

Don't let these weeds be the demise of our native plants

When you see flowers in your garden that you don't recognize, or when you see a plant that you don't know, it's important to take a closer look. Some of the most common weeds in our gardens are introduced species that have become established and are now a major problem. These weeds can outcompete native plants for water, nutrients, and sunlight, and they can also spread to other areas of your garden. It's important to identify these weeds early and remove them before they become a major problem. This can be done by pulling them out by hand or using a weed puller. If you're not sure what a plant is, you can ask a professional for help. It's important to remember that weeds can be a sign of a larger problem, such as a pest infestation or a disease. If you see a weed in your garden, it's important to take action now to prevent it from becoming a major problem.
