

## **FS Sensitive Plants**

There are no known occurrences of sensitive plants in or immediately adjacent to the project area. Potential habitat for *Astragalus barrii* is very limited within the project area and unlikely to be included in proposed activities. The nearest population (*Carex gravida*) occurs about one mile to the west of Holiday Campground and typically occurs within moist hardwood draws. When applying SMZ requirements, harvest activities are not expected to affect potential *Carex gravida* habitat. Two temporary road crossings through moist hardwood draws which could impact potential habitat. Individual plants may be impacted, but temporary road crossings are not likely to impact the viability of any population that might be present. Prescribed fire activities are not expected to appreciably affect potential *Carex gravida* habitat in the long term.
