61c - GS under max trees size limit by altn

For a given alternative, each land allocation has an associated prescription

The prescription listed and any **lower** number prescription are permitted except where the prescription appears in a black border box. In that case, only the assigned prescription is permitted and let grow.

A particular land area may be affected by or be a member of several land allocation (overlapping). When overlapping allocations occur, the lowest number prescription in the set applies and any lower number is also permitted.

the 'letgrw' or no treatment prescription is **always permitted**

The prescription selected are then a condition for the objective function(s) in an alternative and the constraints (S&G's)

There are except to these generalized allocation rules where intersections of specific allocation require a higher level of treatment (override).

Override only apply to codes equal to or higher than lowest code in the intersection set. If specific area also intersects a allocation with a code lower than those in exception set, then the lower code defines the prescription.
