An intermediate step in this process was to equate the changes in the respective resource outputs to changes in final demand expenditures by sector. Final demand expenditures are different from the values used in the PNV efficiency analysis. The PNV efficiency analysis examines only the market value of the raw material that leaves the Forest. For the case of timber outputs, this would be the stumpage values. On the other hand, final demand expenditures represent the dollars spent by the ultimate consumer at the point of final consumption. The point of final consumption is the sector from which the ultimate consumer purchases a product, or the sector beyond which the output is exported from the region. For example, the point of final consumption for an output of timber might be in the construction sector because the timber is used in the construction of a house which a consumer may purchase. However, if the timber is exported following processing at the sawmill, the point of final consumption is the primary wood processing sector. By identifying the final consumption point, the transactions of all industries involved in processing the output are considered.

Table B-V-4 lists outputs for which final demand expenditures were estimated. A more detailed documentation of the input-output analysis can be found in the planning records.

**TABLE B-V-4
OUTPUTS USED IN I-O ANALYSIS**

<u>Output</u>	<u>Unit of Measure</u>
Softwood Sawtimer	MMBF
Livestock Grazing	MAUM
Developed Recreation	MRVD
Motorized Recreation	MRVD
Non-Motorized Recreation	MRVD
Fishing	MWFUD
Hunting	MWFVD
Viewing Wildlife	MWFVD

2. Returns to the U.S. Treasury and Local Governments

Returns to the U.S. Treasury and payments to local governments were estimated in a manner compatible with the 1980 RPA and the draft 1985 RPA. Returns to the Treasury are based on receipts for Forest goods and services.

Timber receipts include cash payments for timber, required cooperative deposits (K-V), brush disposal, salvage fund, cooperative road maintenance, and purchaser credit for road construction. This was estimated using timber revenues from FORPLAN minus logging costs.

Grazing receipts were based on the average grazing fee from 1977 through 1983. This was multiplied by the estimated number of animal unit months (AUMs) which would be demanded by period.

Minerals receipts were based on royalty payments for oil and gas leases, geothermal leases, and out-service use of common minerals. Mineral receipts were assumed to be constant among alternatives due to the uncertainties involved in estimating the timing of development and the quantities that would be extracted.

Recreation receipts were based on campground fees and charges for special use permits. Campground fees were based on an average charge of \$5.00 per unit times the anticipated use by period. Recreation and non-recreation special use permit receipts were based on historical levels.

Payments to local governments were estimated as a percentage of total receipts. Twenty-five percent of the receipts for all commodities except minerals, and 50 percent of minerals receipts, were assumed to be payments to local governments. These funds are paid to the State of Washington which distributes them to the county in which they originated. These funds are often referred to as payments in lieu of taxes.

C. Information Generated from the Social and Economic Impact Analysis

Chapters II and IV of the FEIS present the details of the anticipated socio-economic impacts associated with the implementation of each alternative. In particular, Table II-3a displays the estimated impacts associated with each alternative for the first, second, and fifth decades (as represented by the individual years 1986, 2000, and 2030) with regards to jobs, personal income, total returns to the U.S. Treasury, and payments to counties. A generalized brief narrative of the findings is presented here.

Since the early 1980's we have been in a economic and technological transition in the wood products industry. There are trends that indicate that employment per unit of output is declining, and this would cause a change in the 1982 coefficients used to generate future employment estimated for the alternatives. The current table numbers should be used in a relative sense only, and not the absolute.

The modeling of economic impacts was based on the proposed changes in resource output levels between each respective alternative and the output levels upon which the current economy is based. These changes were used as input to the I-O model and it, in turn, would provide the estimated direct, indirect, and induced impacts on jobs and income among other things. Table B-V-5 presents the current output levels for each resource, and the total jobs and income response coefficients that would result from an output change of one unit for each resource. For example, 144.8 MMBF of sawtimber has historically been harvested on the Forest annually. If an alternative proposed to change this by 1 MMCF, a potential change of 11.28 jobs and \$.3073 MM (in 1982 dollars) could be realized in the local economy after all direct, indirect, and induced effects are accounted for.

**TABLE B-V-5
EMPLOYMENT AND INCOME RESPONSE COEFFICIENTS BY RESOURCE**

<u>Output</u>	<u>Current Output level</u>	<u>Change in Output</u>	<u>Change in Employment(jobs)</u>	<u>Change in Income(MM\$)</u>
Softwood Sawtimber	144.8 MMBF	1 MMBF	11.28	0 3073
Livestock Grazing	21.6 MAUM	1 MAUM	0.50	0 0093
Developed Recreation	2313.25 MRVD	1 MRVD	0 07	0.0021
Motorized Recreation	1942.60 MRVD	1 MRVD	0.44	0.0108
Non-Motorized Recreation	492 50 MRVD	1 MRVD	0 33	0 0068
Fishing	294 80 MWFUD	1 MWFUD	0 13	0.0033
Hunting	183.13 MWFUD	1 MWFUD	0.32	0.0076
Viewing Wildlife	245.77 MWFUD	1 MWFUD	0.20	0.0054

In general, alternatives which emphasize commodity outputs tend to produce the most jobs, income, returns to the U.S. Treasury, and payments to local governments. Recreation accounts for the most employment and income in total, but doesn't vary significantly between alternatives. The management of the Forest in terms of recreation varies considerably between alternatives, but the number of estimated recreation users does not. Timber receipts are by far the greatest source of returns to the U.S. Treasury and payments to local governments.

With regards to lifestyles and social organization, different groups will be affected differently depending on the nature of the alternative being considered. Commodity oriented alternatives tend to do well with regards to maintaining the economic aspects of the social structure in the area. Increased supplies of timber, in particular, provide the wherewithal for the local wood processing industry to respond to regional and national markets, which in turn means more relatively higher paying jobs. To the extent that some communities are more dependent upon the wood products industry than others, they will benefit. In addition, more timber means more revenues to the counties which is also an asset when it comes to implementing and maintaining public projects in the local communities, whether they be timber dependent or not. Some communities are much more dependent on recreation and tourism, however. Maintenance or enhancement of scenery and recreation opportunities may be more important to community stability in these cases.

Finances aside, other types of Forest Service decisions can influence the attitudes, beliefs, and values of Forest dependent communities. Generally, those groups or communities who view or use the Forest from an amenity standpoint are positively impacted by amenity-oriented alternatives and negatively affected by those alternatives with a commodity emphasis. Decisions regarding whether or not to develop roadless areas for timber harvesting and how much timber should be harvested at the expense of scenic quality, wildlife, and other noncommodity types of resources will tend to polarize groups with different values and pull together groups with common values. The composition of the groups may change with regards to different issues.

Almost all groups and communities can adapt to slow changes in their environment. However, rapid and dramatic changes in the way the Forest is managed are likely to result in broad levels of social disruption.

VI. ANALYSIS PRIOR TO DEVELOPMENT OF ALTERNATIVES

A. Introduction

The primary analysis prior to development of alternatives was the "Analysis of the Management Situation" (AMS). This step examines the ability of the Forest to supply goods and services in response to society's demands. The primary purpose of this analysis is to provide a basis for formulating a broad range of reasonable alternatives. This is accomplished by defining the "decision space" within which the Forest can operate to address issues, concerns, and opportunities. This planning step is documented in a planning document titled "Analysis of the Management Situation and Proposed Alternatives." Most of the relevant information is also found in this appendix.

A series of benchmarks were developed in accordance with Regional direction (November 10, 1983). FORPLAN was the major analytical tool used in this process. A few benchmarks were estimated outside of FORPLAN. Electronic spreadsheets were used to calculate present net value, budgets, returns to the Treasury and payments to local governments. IMPLAN was used to estimate impacts on employment and income. Use of these analysis tools has been explained in prior sections of this appendix.

The primary analysis performed prior to the development of all alternatives except the No Change Alternative was the "Analysis of the Management Situation" (AMS). It is unknown what analysis was performed prior to the development of the TM Plans. Provisions of 36 CFR 219.12(e) may not have been met in the development of Alternative NC.

B. Development of Management Requirements

The Pacific Northwest Region developed direction to assure that the management requirements (MR's) of the National Forest Management Act (36 CFR 219.27) were applied consistently across all Forests within the Region. This direction (letter from Jeff Sirmon, designation 1920, dated February 9, 1983, on "Regional Guidelines for Incorporating Minimum Management Requirements in Forest Planning") is on file in the Regional Office in Portland and the Supervisor's Office in Wenatchee.

Application of the standards and guidelines is sufficient to achieve most management requirements without impacting the levels of goods and services provided by the Forest. Some management requirements for timber, soil, water, and wildlife required special modeling constraints, however. These constraints were developed such that they were not compounding. In other words, one constraint might accomplish more than one requirement. These are discussed in more detail below.

The size of created openings is generally limited to 40 acres in size with logical cutting units left in between [36 CFR 219.27(d)]. It was necessary to model this management requirement in FORPLAN because linear programming solutions tend to allocate entire decision variables (in this case, analysis area/management prescription/timing choice options) rather than split them. This results in entire analysis areas which often include contiguous blocks of much more than 40 acres being harvested in one decade. FORPLAN was constrained such that no more than one-fourth of an analysis area could be regeneration harvested in any given decade. This constraint was also considered helpful in meeting soil and water management requirements [36 CFR 219.27(f)]. The dispersion factor is based on the professional judgment of the Interdisciplinary Team.

Special attention must be given to land and vegetation near water [36 CFR 219.27(e)]. A management prescription, the Riparian-Aquatic Habitat Protection Zone (EW-2) Prescription, was developed for areas immediately surrounding the riparian zone. This prescription applies to a variable width area based on slope, soil hazard, and vegetative type.

The portion of each analysis area that would be comprised of the riparian protection zone was estimated based on Stream Classes. These acres were assigned to the Riparian-Aquatic Habitat Protection Zone Prescription in each FORPLAN run that meet management requirements.

The wildlife management requirements used in this plan were developed by the Region and revised several times between 1983 and 1986. Information relating to the revisions and the final management requirements can be found in the document "A Background Document on the Development and Review of Minimum Management Requirements for Forest Planning on the National Forest of the Pacific Northwest Region, USDA Forest Service, June 1986." In the Regional management requirements, the Wenatchee National Forest is part of the "Eastside Cascades Zone." The species or habitats with management requirements are: bald eagles, peregrine falcons, grizzly bears, gray wolves, northern spotted owls, pileated woodpeckers, pine marten, northern three-toed woodpeckers, primary cavity excavators, and riparian. Between the Draft EIS and the Final EIS the strategies for these species were changed. The information on specific requirements is contained in Chapter IV of the FEIS, and Appendix I.

Allocations of habitat for the above species have been made to provide suitable habitat for the species and secondarily to minimize the effects on other resources. Where possible, habitat for wildlife has been overlapped with other resource goals to get the best for all resources. Some of these overlaps include wildlife overlapping with wildlife (pileated woodpecker habitat overlapping with spotted owl habitat) as well as wildlife overlapping with other resources (spotted owl habitat overlapping with wilderness).

The Forest has used the following strategies for meeting the management requirements for the listed wildlife species.

Bald Eagle: The recovery goal for the Forest is for the establishment and/or protection of 8 nest sites, protection of all roost sites and providing high quality feeding and perching habitat. Forest-wide Standards and Guidelines for all alternatives provide for the recovery of this species.

Peregrine Falcon: The Forest-wide Standards and Guidelines provide management direction to meet the recovery objectives of this species in all alternatives.

Grizzly Bear: The Forest is participating in a study to see what the habitat conditions are for this species and where management for the species may be feasible. When this study is completed, the USFWS will decide where the recovery area will be and what management strategies and requirements will be needed. If part of the recovery area is on the Forest, then the Final EIS and LRMP will be revised to incorporate the recovery plan objectives to manage for Grizzly Bears.

Gray Wolves: At present there is no recovery goal for this species on the Wenatchee National Forest. Therefore there have been no requirements established for maintaining habitat. The Forest will continue to monitor and evaluate reported sightings in coordination with Washington Department of Wildlife and U.S. Fish and Wildlife Service.

Spotted Owl: Spotted owl sites have been identified according to the management direction provided in the Regional Final Supplement on spotted owls. Spotted owl habitat will be maintained by the Old Growth Management prescription and Forest-wide Standards and Guidelines. All alternatives but Alternative NC meet or exceed the requirements for this species.

Pileated Woodpecker: Establish one habitat area for every 12,000 to 13,000 acres. The habitat area requirements are:

Within a 1,000 acre unit maintain 300 acres of conifers in a mature and/or old growth seral stage as breeding and nesting habitat. Within this reproductive area maintain a minimum average of 2 hard snags (12 inch DBH or larger) per acre; 45 of these snags should be 20 inch DBH or larger. When possible, maintain reproductive areas in contiguous acres. If that is not possible, habitat may be arranged in blocks of no less than 50 acres each and no more than 1/4 mile apart. Maintain a minimum average of 2 hard snags per acre (10 inch DBH or larger) on an additional 300 acres as feeding habitat.

Pine Marten/Northern Three-Toed Woodpecker: Establish one habitat area every 4,000 to 5,000 acres. The habitat requirements are:

Maintain 160 contiguous acres of conifers in mature and/or old growth seral stages with a crown closure of 50 percent or more. Within this area maintain an average of 2 hard snags (12 inch DBH or larger) per acre; 24 of these snags should be 20 inch DBH or larger. Maintain a minimum of 6 down logs per acre, 12 inch diameter or larger and at least 20 feet in length.

Primary Cavity Excavators: The management requirements for these species is to maintain a 20% or higher level, distributed per 40 acres of suitable habitat across the Forest. All alternatives plan to maintain at least the 40% potential population and at least 20% potential population per 40 acres. Each prescription has a potential population goal that is compatible with the resource outputs objectives. This varies from 20% potential population in the General Forest Prescription to 100% potential population in the Old Growth Management Prescription. There are Forest-wide Standards and Guidelines to establish additional distribution criteria and sideboards for management.

Riparian Habitat: Indicator species for the riparian habitat are beaver and ruffed grouse (see FEIS Chapter III, Wildlife for selection criteria). The habitat requirements for these species has been incorporated into Forest-wide Standards and Guidelines and the riparian prescription (EW-2). The requirements apply to all alternatives except Alternative NC.

An analysis was performed to determine the opportunity costs of different ways of meeting Management Requirements (MR's) for key resource outputs. This analysis was made and the information developed after the Forest Service held discussions with the Northwest Forest Resource Council, which had filed Appeal No. 1770 on September 18, 1986. Although the appeal was dismissed, the concerns addressed were important. Details of the analysis are reported in Appendix I of this document. The MR's were applied to all alternatives, except NC, described in the Final Environmental Impact Statement.

C. Displayed Benchmarks

The role of benchmark analysis in the analysis of the management situation is specified in 36 CFR 219.12(e). Benchmark analysis serves a variety of purposes, including:

- defining the range within which alternatives can be constructed;
- defining the maximum economic and biological resource production potentials;
- estimating the mix of resource uses, as well as a schedule of outputs and costs, associated with the objectives of each benchmark;
- analyzing the potential to resolve issues and concerns,
- analyzing the implications of continuing current management direction and whether a need to change current direction exists,

- analyzing the implications of existing laws and policies;
- analyzing the implications of economic assumptions;
- evaluating the complimentary and conflicting production relationships between the goods and services provided by the Forest.

Eleven benchmarks are presented in detail in this report. These benchmarks can be grouped into five general types:

- the current direction benchmark which simulates management of the Forest under currently existing direction;
- the minimum level benchmark which simulates the minimum level of custodial management necessary to keep the Forest in public ownership;
- economic benchmarks which maximize present net value to define the most efficient levels of resource outputs;
- single resource emphasis benchmarks which define maximum production levels;
- benchmarks which analyze the implications of existing laws and policies, and economic assumptions.

Changes in the alternative formulation and modeling parameters resulted in the benchmark data displayed in the DEIS being no longer comparable to the alternatives displayed in the FEIS.

The benchmarks displayed in this section are updated to be comparable with the alternatives displayed in the FEIS. This update was done outside the FORPLAN model. The planning records contain the analytical records used to update the benchmarks.

A discussion of individual benchmarks follows. The purpose of the benchmark, assumptions, and constraints are examined. The results of the benchmarks are summarized subsequently in Section VI.F.

Based upon benchmark analysis performed during the Analysis of the Management Situation, Alternative NC falls within the decision space available for managing the National Forest.

1. Current Direction Benchmark

a. Description

The current direction benchmark simulates the management most likely to be carried out into the future if current direction is followed. It is based on plans formulated and approved prior to the passage of the National Forest Management Act and existing policies, standards, and guidelines.

The current direction benchmark forms the basis for the “no-action” alternative required by the National Environmental Policy Act. It provides an analysis base to determine whether a need for change exists when contrasted with other benchmarks and demands for various outputs.

b. Formulation

- Objective function used is to maximize present net value for the entire modeling horizon, including both market values and assigned values.

- Timber harvest can be scheduled only on lands classified as suitable for timber harvest through the Stage I suitability analysis (see Chapter III for acreages).
- Timber harvest cannot exceed the long-term sustained-yield capacity in any decade.
- Timber harvest cannot decrease in any decade as compared to the immediately preceding decade (nondeclining flow).
- Sufficient timber inventory must remain at the end of the modeling horizon to sustain timber harvest at the long-term sustained-yield capacity.
- Regeneration harvests cannot be scheduled until stands have reached 95 percent of culmination of mean annual increment.
- Regeneration harvests are dispersed to meet Regional guidelines for size and separation of harvest units.
- Less intensive silvicultural practices are scheduled in riparian areas to meet management requirements for soil and water.
- Old-growth units are dedicated according to Regional guidelines for distribution and amount to meet management requirements for old growth dependant species.
- No more than 7.2 percent of areas allocated to the Scenic Travel-Retention Prescription, or 10 percent of areas allocated to the Scenic Travel-Partial Retention Prescription, can be harvested per decade.
- Land allocations used are those specified in the Alpine Lakes Management Plan, the Chelan and Kittitas Unit Plans and the Ranger District multiple use plans.

2. Minimum Level Benchmark

a. Description

The minimum level benchmark specifies the minimum level of management which would be needed to maintain the Forest as part of the National Forest System and to manage uncontrollable outputs and uses. Minimum environmental constraints and an obligation to protect the life, health, and safety of the casual visitor must be met. This benchmark ignores the transition period which would be required to move from current to minimum level management.

The purpose of this benchmark is to determine the minimum costs and resultant outputs associated with maintaining the Forest in Federal ownership. This cost level is not discretionary in the programing and budgeting process.

b. Formulation

- Practices and costs are only those necessary to keep the Forest in public ownership.

- Some costs are necessary to protect the life, health, and safety of incidental users, to prevent environmental damage to lands or resources of adjoining ownerships; administer unavoidable special uses; and not allow significant impairment of the productivity of the land.

-Outputs associated with this benchmark include only uncontrollable outputs and uses, such as naturally occurring water runoff, wildlife and fish, and dispersed recreation.

-Costs for a transition "close down" are not included as per Regional direction (11/10/83).

3. Benchmark Run #1

a. Description

Benchmark Run #1 establishes the highest level of sustainable timber production possible on the Forest under a policy of nondeclining flow and in the absence of management requirements. Timber rotation age restrictions (95 percent CMAI) are imposed.

This benchmark is initially used to verify that the FORPLAN model is reasonable in terms of timber information. When contrasted to the maximum timber resource benchmark, it provides an estimate of the maximum possible impact of management requirements on timber harvest levels.

b. Formulation

-Three objective functions are used sequentially: 1) timber harvest is maximized for the first decade; 2) timber harvest is maximized for the 15 decade modeling horizon, subject to meeting the first decade timber harvest level established in step 1; 3) present net value is maximized for the 15 decade modeling horizon, subject to meeting the first decade and 15 decade timber harvest levels established in steps 1 and 2.

-Timber harvest can be scheduled only on lands classified as suitable for timber harvest through the Stage I suitability analysis (see Chapter III for acreages).

-Timber harvest cannot exceed the long-term sustained yield capacity in any decade.

-Timber harvest cannot decrease in any decade as compared to the immediately preceding decade (nondeclining flow).

-Sufficient ending inventory must remain at the end of the modeling horizon to sustain timber harvest at the long-term sustained yield capacity.

-Regeneration harvests cannot be scheduled until stands have reached 95 percent of culmination of mean annual increment.

-No more than 7.2 percent of areas allocated to the Scenic Travel-Retention Prescription, or 10 percent of areas allocated to the Scenic Travel-Partial Retention Prescription, can be harvested per decade.

-Existing wilderness, existing developed recreation sites, proposed research natural areas, and the Mather Memorial Highway corridor are constrained to their current land allocations.

4. Benchmark Run #2

a. Description

Benchmark Run #2 provides a basis for formulating and evaluating management requirements. The opportunity cost of harvest floors can be evaluated. The combined effect of departing from nondeclining flow and not restricting rotations to 95 percent of culmination of mean annual increment can be observed by contrasting this benchmark with Benchmark Run #3.

b. Formulation

- Objective function used is to maximize present net value for the entire modeling horizon, including both market values and assigned values.
- Timber harvest can be scheduled only on lands classified as suitable for timber harvest through the Stage I suitability analysis (see Chapter III for acreages).
- Timber harvest cannot fluctuate by more than plus or minus 20 percent from one decade to the next.
- Regeneration harvests can be scheduled as soon as minimum merchantability limits are met.
- Sufficient ending timber inventory must remain at the end of the modeling horizon to sustain timber harvest at the long-term sustained yield capacity.
- No more than 7.2 percent of areas allocated to the Scenic Travel-Retention Prescription, or 10 percent of areas allocated to the Scenic Travel-Partial Retention Prescription, can be harvested per decade.
- Existing wilderness, existing developed recreation sites, proposed research natural areas, and the Mather Memorial Highway corridor are constrained to their current land allocations.

5. Benchmark Run #3

a. Description

Benchmark Run #3 provides an estimate of the mix of resource uses and a schedule of outputs and costs which maximize the present net value of those major outputs that have an established market price or an assigned monetary value. Management requirements need not be met. Timber rotation age restrictions (95 percent CMAI) and nondeclining flow constraints are imposed.

Management requirements can be analyzed by comparing this benchmark with Benchmark Run #7. It can also be compared with Benchmark Run #2 to analyze the impact of nondeclining flow and rotation age restrictions in the absence of management requirements.

b. Formulation

- Objective function used is to maximize present net value for the entire modeling horizon, including both market values and assigned values.
- Timber harvest can be scheduled only on lands classified as suitable for timber harvest through the Stage I suitability analysis (see Chapter III for acreages).
- Timber harvest cannot exceed the long-term sustained yield capacity in any decade.
- Timber harvest cannot decrease in any decade as compared to the immediately preceding decade (nondeclining flow).
- Sufficient timber inventory must remain at the end of the modeling horizon to sustain timber harvest at the long-term sustained yield capacity.

-Regeneration harvests cannot be scheduled until stands have reached 95 percent of culmination of mean annual increment.

-No more than 7.2 percent of areas allocated to the Scenic Travel-Retention Prescription, or 10 percent of areas allocated to the Scenic Travel-Partial Retention Prescription, can be harvested per decade.

-Existing wilderness, existing developed recreation sites, proposed research natural areas, and the Mather Memorial Highway corridor are constrained to their current land allocations.

6. Benchmark Run #4

a. Description

Benchmark Run #4 provides a basis for evaluating management requirements when contrasted with Benchmark Run #2. This benchmark provides an estimate of the mix of resource uses and a schedule of outputs and costs which maximize the present net value of those major outputs that have an established market price or an assigned monetary value, subject to meeting management requirements. Timber rotation age restrictions and nondeclining flow constraints are not imposed.

b. Formulation

-Objective function used is to maximize present net value for the entire modeling horizon, including both market values and assigned values.

-Timber harvest can be scheduled only on lands classified as suitable for timber harvest through the Stage I suitability analysis (see Chapter III for acreages).

-Timber harvest cannot fluctuate by more than plus or minus 20 percent from one decade to the next.

-Sufficient ending inventory must remain at the end of the modeling horizon to sustain timber harvest at the long-term sustained yield capacity.

-Regeneration harvests can be scheduled as soon as minimum merchantability limits are met.

-Regeneration harvests are dispersed to meet Regional guidelines for size and separation of harvest units.

-Less intensive silvicultural practices are scheduled in riparian areas to meet management requirements for soil and water.

-Old-growth units are dedicated according to Regional guidelines for distribution and amount to meet management requirements for old-growth dependent species.

-No more than 7.2 percent of areas allocated to the Scenic Travel-Retention Prescription, or 10 percent of areas allocated to the Scenic Travel-Partial Retention Prescription, can be harvested per decade.

-Existing wilderness, existing developed recreation sites, proposed research natural areas, and the Mather Memorial Highway corridor are constrained to their current land allocations.

7. Benchmark Run #5

a. Description

Benchmark Run #5 provides a basis for evaluating rotation age restrictions (95 percent CMAI) in the absence of nondeclining flow assumptions when contrasted with Benchmark Run #4.

b. Formulation

-Objective function used is to maximize present net value for the entire modeling horizon, including both market values and assigned values.

-Timber harvest can be scheduled only on lands classified as suitable for timber harvest through the Stage I suitability analysis (see Chapter III for acreages).

-Timber harvest cannot fluctuate by more than plus or minus 20 percent from one decade to the next.

-Sufficient ending inventory must remain at the end of the modeling horizon to sustain timber harvest at the long-term sustained yield capacity.

-Regeneration harvest cannot be scheduled until stands have reached 95 percent of culmination of mean annual increment.

-Regeneration harvests are dispersed to meet Regional guidelines for size and separation of harvest units.

-Less intensive silvicultural practices are scheduled in riparian areas to meet management requirements for soil and water.

-Old-growth units are dedicated according to Regional guidelines for distribution and amount to meet management requirements for old growth dependent species.

-No more than 7.2 percent of areas allocated to the Scenic Travel-Retention Prescription, or 10 percent of areas allocated to the Scenic Travel-Partial Retention Prescription, can be harvested per decade.

-Existing wilderness, existing developed recreation sites, proposed research natural areas, and the Mather Memorial Highway corridor are constrained to their current land allocations.

8. Benchmark Run #6

a. Description

Benchmark Run #6 provides a basis for evaluating nondeclining flow constraints in the absence of rotation age restrictions when contrasted with Benchmark Run #4.

b. Formulation

-Objective function used is to maximize present net value for the entire modeling horizon, including both market values and assigned values.

-Timber harvest can be scheduled only on lands classified as suitable for timber harvest through the Stage I suitability analysis (see Chapter III for acreages).

-Timber harvest cannot exceed the long-term sustained yield capacity in any decade.

-Timber harvest cannot decrease in any decade as compared to the immediately preceding decade (nondeclining flow).

-Sufficient ending inventory must remain at the end of the modeling horizon to sustain timber harvest at the long-term sustained yield capacity.

-Regeneration harvests are dispersed to meet Regional guidelines for size and separation of harvest units.

-Less intensive silvicultural practices are scheduled in riparian areas to meet management requirements for soil and water.

-Old-growth units are dedicated according to Regional guidelines for distribution and amount to meet management requirements for old growth dependent species.

-No more than 7.2 percent of areas allocated to the Scenic Travel-Retention Prescription, or 10 percent of areas allocated to the Scenic Travel-Partial Retention Prescription, can be harvested per decade.

-Existing wilderness, existing developed recreation sites, proposed research natural areas, and the Mather Memorial Highway corridor are constrained to their current land allocations.

9. Benchmark Run #7

a. Description

Benchmark Run #7 provides an estimate of the mix of resource uses and a schedule of outputs and costs which maximize the present net value of those major outputs that have an established market price or an assigned monetary value. This is required by 36 CFR 219.12(e)(1)(iii)(B). Management requirements must be met. Timber rotation age restrictions (95 percent CMAI) and nondeclining flow constraints are imposed.

The purpose of this benchmark is to serve as a basis for comparison with other benchmarks and alternatives. Opportunity costs of meeting certain resource objectives as well as impacts of legal and policy constraints can be evaluated in these comparisons.

b. Formulation

-Objective function used is to maximize present net value for the entire modeling horizon, including both market values and assigned values.

-Timber harvest can be scheduled only on lands classified as suitable for timber harvest through the Stage I suitability analysis (see Chapter III for acreages).

-Timber harvest cannot exceed the long-term sustained yield capacity in any decade.

-Timber harvest cannot decrease in any decade as compared to the immediately preceding decade (nondeclining flow).

-Sufficient timber inventory must remain at the end of the modeling horizon to sustain timber harvest at the long-term sustained yield capacity.

-Regeneration harvests cannot be scheduled until stands have reached 95 percent of culmination of mean annual increment.

-Less intensive silvicultural practices are scheduled in riparian areas to meet management requirements for soil and water.

-Old-growth units are dedicated according to Regional guidelines for distribution and amount to meet management requirements for old growth dependant species.

-No more than 7.2 percent of areas allocated to the Scenic Travel-Retention Prescription or 10 percent of areas allocated to the Scenic Travel-Partial Retention Prescription can be harvested per decade.

-Existing wilderness, existing developed recreation sites, proposed research natural areas, and the Mather Memorial Highway corridor are constrained to their current land allocations.

10. Maximum Timber Benchmark

a. Description

The maximum timber benchmark provides an estimate of the mix of resource uses and a schedule of outputs and costs which maximize the capability of the Forest to produce timber. Management requirements must be met. Timber rotation age restrictions (95 percent CMAI) and nondeclining flow constraints are imposed.

This benchmark shows the highest sustainable level of timber production possible given existing laws and policies. A comparison of the maximum timber level benchmark with other benchmarks shows the implications to timber of meeting other resource and economic objectives.

b. Formulation

-Three objective functions are used sequentially: 1) timber harvest is maximized for the first decade, 2) timber harvest is maximized for the 15 decade modeling horizon, subject to meeting the first decade timber harvest level established in step 1; 3) present net value is maximized for the 15 decade modeling horizon, subject to meeting the first decade and 15 decade timber harvest levels established in steps 1 and 2.

-Timber harvest can be scheduled only on lands classified as suitable for timber harvest through the Stage I suitability analysis (see Chapter III for acreages).

-Timber harvest cannot exceed the long-term sustained yield capacity in any decade.

-Timber harvest cannot decrease in any decade as compared to the immediately preceding decade (nondeclining flow).

- Sufficient timber inventory must remain at the end of the modeling horizon to sustain timber harvest at the long-term sustained yield capacity.
- Regeneration harvests cannot be scheduled until stands have reached 95 percent of culmination of mean annual increment.
- Regeneration harvests are dispersed to meet Regional guidelines for size and separation of harvest units.
- Less intensive silvicultural practices are scheduled in riparian areas to meet management requirements for soil and water.
- Old-growth units are dedicated according to Regional guidelines for distribution and amount to meet management requirements for old-growth dependant species.
- No more than 7.2 percent of areas allocated to the Scenic Travel-Retention Prescription, or 10 percent of areas allocated to the Scenic Travel-Partial Retention Prescription, can be harvested per decade.
- Existing wilderness, existing developed recreation sites, proposed research natural areas, and the Mather Memorial Highway corridor are constrained to their current land allocations.

11. Maximum Unroaded Recreation Benchmark

a. Description

The maximum unroaded recreation benchmark provides an estimate of the mix of resource uses and a schedule of outputs and costs which maximize the capability of the Forest to provide unroaded recreation opportunities. Management requirements must be met. Timber rotation age restrictions (95 percent CMAI) and nondeclining flow constraints are imposed.

The maximum unroaded recreation level benchmark estimates the maximum capability of the Forest to provide primitive, semi-primitive non-motorized, and semi-primitive motorized recreation opportunities given existing laws and policies. A comparison of this benchmark to other benchmarks shows the implications to unroaded recreation of meeting other resource and economic objectives.

b. Formulation

- Objective function used is to maximize present net value for the entire modeling horizon, including both market values and assigned values.
- Timber harvest can be scheduled only on lands classified as suitable for timber harvest through the Stage I suitability analysis (see Chapter III for acreages).
- Timber harvest cannot exceed the long-term sustained yield capacity in any decade.
- Timber harvest cannot decrease in any decade as compared to the immediately preceding decade (nondeclining flow).
- Sufficient timber inventory must remain at the end of the modeling horizon to sustain timber harvest at the long-term sustained yield capacity.

-Regeneration harvests cannot be scheduled until stands have reached 95 percent of culmination of mean annual increment.

-Regeneration harvests are dispersed to meet Regional guidelines for size and separation of harvest units.

-Less intensive silvicultural practices are scheduled in riparian areas to meet management requirements for soil and water.

-Old-growth units are dedicated according to Regional guidelines for distribution and amount to meet management requirements for old-growth dependant species.

-No more than 7.2 percent of areas allocated to the Scenic Travel-Retention Prescription, or 10 percent of areas allocated to the Scenic Travel-Partial Retention Prescription, can be harvested per decade.

-Existing wilderness, existing developed recreation sites, proposed research natural areas, and the Mather Memorial Highway corridor are constrained to their current land allocations.

-Timber harvest can be scheduled only in areas which are currently roaded.

-No unroaded areas will be accessed by road for any purpose.

- No existing roads will be closed to create additional unroaded area.

D. Benchmark Analysis

Analysis of benchmarks was conducted in accordance with the Chief's 1920 memo of May 13, 1983. The terminology used corresponds to Cargell's 1920 memo of May 31, 1983, and the Regional Direction Package. This facilitates comparison of benchmark analysis between National Forests.

1. Constraint Sets

Detailed description of the assumptions and constraints found in each benchmark are found in Section VI.C. Table B-VI-1 summarizes the constraint sets found in each benchmark. Impacts of these constraints can be examined by comparing the constraint sets to the results of the benchmarks. Benchmark results follow in Section VI.F.

**TABLE B-VI-1
Benchmark Constraint Sets**

RUN	OBJECTIVE FUNCTION	LAND BASE	ENDING INVENT	MR's	SEQ U+L FLOORS CEILINGS	NDY	ROT BASED ON UTIL STDS.	ROT BASED ON 95% CMAI
Run #1	max timber lands	tentatively suitable lands	x			x		x
Run #2	max PNV (assigned)	tentatively suitable lands	x		x		x	
Run #3	max PNV (assigned)	tentatively suitable lands	x			x		x
Run #4	max PNV (assigned)	tentatively suitable lands	x	x	x		x	
Run #5	max PNV (assigned)	tentatively suitable lands	x	x	x			x
Run #6	max PNV (assigned)	tentatively suitable lands	x	x		x	x	
Run #7	max PNV (assigned)	tentatively suitable lands	x	x		x		x
Run #8	max PNV (market)	tentatively suitable lands	x	x	x		x	
Run #9	max PNV (market)	tentatively suitable lands	x	x	x			x

Current	max PNV (assigned)	tentatively suitable lands	x	x		x		x

E. Sensitivity Analysis of Assigned Values Versus Market Values

Benchmark Runs #4, #5, #6, and #7, four versions of the maximum present net value benchmark, were formulated two ways: 1) both market and assigned values (timber, livestock forage, recreation, fish, and wildlife); and 2) using only market values (timber and livestock forage). These later runs were labeled as Benchmark Runs #8, #9, #10, and #11 respectively.

The value of the FORPLAN objective function varied between the two sets of runs due to having different outputs valued. Allocation, scheduling, and output levels did not vary between the runs. The FORPLAN model, as formulated, is not sensitive to the inclusion of recreation, fish, and wildlife values. This is probably due to recreation capacity estimates exceeding demand projections except in later decades of benchmarks or alternatives which have high levels of timber harvest.

An analysis of the effects MR's have on certain resource outputs was performed. Results of the analysis are discussed in detail in Appendix I. The analysis involves the opportunity costs associated with each MR when compared to the maximum PNV benchmark.

F. Results of Benchmark Analysis

Management objectives of benchmarks and alternatives were modeled in FORPLAN by applying the assumptions and constraints listed in Sections VI and VII of this appendix. Opportunity costs of constraints were determined by comparing FORPLAN runs with a constraint and without it. Most discussion of opportunity costs focuses on changes in present net value. Changes in other outputs and effects (e.g., timber volume or old-growth habitat) can also be considered.

Constraints which are specific to individual alternatives are analyzed in Sections VII.C. and VIII D. Constraints and assumptions common to benchmarks and alternatives are discussed below. An earlier formulation of the Forest's FORPLAN model was used in some of the benchmark analysis discussed below than was used for alternatives and major benchmarks. Information from these early runs is identifiable by the letter "A" in the benchmark name (e.g., Benchmark Run #7A). The early runs have slightly different outputs and effects than the current model formulation but the relative effects of constraints is still applicable.

Certain legal and policy constraints and economic assumptions were analyzed as part of the analysis of the management situation. Those items considered were:

- Harvest floors;
- Management requirements;
- Restricting harvests to 95 percent culmination of mean annual increment (CMAI),
- Nondeclining flow;
- Nondeclining flow and restricting harvests to 95 percent CMAI in combination,
- Price trend assumptions;
- Cost assumptions.

1. Harvest Floors

Benchmark Run #2A was originally done without a harvest floor. It harvests well above 80 percent of the current harvest level in the first decade. A first decade harvest floor would have had no impact on timber harvest volume or any other factors.

2. Management Requirements

Management requirements (MR's) are represented in FORPLAN by several types of constraints. Riparian areas and a variable width zone around them are assigned to the Riparian-Aquatic Habitat Protection (EW-2) Prescription. Spotted Owl Habitat Areas (SOHA's) are assigned to the Old-Growth Management (OG-1) prescription. Pileated woodpecker, marten, and three-toed woodpecker habitat is assigned to the Mature Habitat (OG-2) prescription. A harvest dispersion constraint is imposed to ensure that harvest units can be laid out to meet Regional guidelines and for soil and water protection. No more than 25 percent of any analysis area can be harvested per decade

The effects of management requirements varies significantly depending upon the type of benchmark examined.

These basic types of benchmarks were analyzed:

- Maximization of present net value, not subject to nondeclining flow (Benchmark Runs #2A, #4A, and variations);

-Maximization of present net value, subject to nondeclining flow (Benchmark Runs #3A, #7A, and variations);

-Maximization of timber volume, subject to nondeclining flow (Benchmark Run #1A, the maximum timber benchmark, and variations).

Four versions of each of the three types of benchmarks were examined:

-No management requirements included;

-Dispersion constraints included but riparian protection and old-growth constraints not included;

-Riparian protection and dispersion constraints included but old-growth constraints not included,

-Old-growth, riparian protection and dispersion constraints included.

An important consideration in interpreting this analysis is the synergistic relationship between constraints. The total effect of the entire constraint package is often different from the sum of its parts. *Estimated effects of all management requirements versus no management requirements are fairly accurate.* However the changes in output levels associated with particular management requirements could have differed had the constraints been added to the FORPLAN model in a different order.

The effects associated with these benchmarks may vary considerably from the effects of management requirements on alternatives. Prescriptions which do not harvest timber or which utilize longer rotation ages similar to the old-growth and riparian protection prescriptions may already be allocated to much of the area affected by management requirements. This lessens the impact on timber harvest levels and present net value considerably.

Table B-VI-2 summarizes the effects of management requirements when present net value is maximized, not subject to nondeclining flow. These benchmarks used 20 percent upper and lower limits on timber volume fluctuations between decades.

TABLE B-VI-2
EFFECTS OF MR's WHEN PRESENT NET VALUE IS MAXIMIZED,
NOT SUBJECT TO NONDECLINING FLOW

<u>MR Mix</u>	<u>LTSY</u> <u>(MMCF)</u>	<u>1st Decade ASQ</u> <u>(MMCF/YR)</u>	<u>PNV</u> <u>(MM\$)</u>
No MR's Included (Benchmark Run #2A)	35.1	55.5	1,804
Dispersion Included	35.3	34.4	1,484
Change from no MR's	+0.6%	-38.0%	-17.7%
Riparian MR's and Dispersion Included	34.4	33.9	1,422
Change from no MR's	-2.0%	-38.9%	-21.2%
Old-Growth and Riparian MR's and Dispersion Included (Benchmark Run #4A)	33.0	32.2	1,342
Change from no MR's	-5.8%	-42.0%	-25.6%

Long-term sustained yield (LTSY) is reduced 5.8 percent when management requirements are imposed. The effect of the dispersion constraint is probably just coincidental. There is no direct linkage between long-term sustained yield and harvest levels in this set of benchmarks. Old-growth and riparian protection MR's affect long-term sustained yield in two ways. Dedicated old-growth areas remove tentatively suitable lands from timber production. Managed mature and riparian protection areas utilize timber harvest regimes which have a smaller contribution to long-term sustained yield than some of the prescriptions which otherwise would have been available for selection.

First decade harvest levels are greatly reduced in this set of benchmarks when management requirements are imposed, particularly harvest dispersion constraints. Harvest levels start high and then decline by the maximum allowable percentage for the first six decades in the absence of dispersion constraints. Harvest levels begin lower and do not fluctuate nearly as much when dispersion constraints are present. Portions of analysis areas which would be harvested in earlier decades in order to maximize present net value must be deferred until later decades to meet dispersion constraints. Old-growth and riparian protection constraints reduce first decade harvest levels slightly but not as much as under nondeclining flow.

Present net value is reduced by 25.6 percent when management requirements are imposed. The dispersion constraint prevents 75 percent of those analysis areas which have the highest contribution to present net value, from being harvested in the first decade when the effect of discounting is minimized. Other effects on present net value are due to the lower level of timber harvest and the change in the mix of prescriptions selected. The old-growth and riparian protection prescriptions involve relatively high costs and longer rotation ages.

Table B-VI-3 below, summarizes the effects of management requirements when present net value is maximized, subject to nondeclining flow. This set of benchmarks are formulated identically to the previously examined set except that timber harvests in any decade cannot be less than that in the preceding decade.

TABLE B-VI-3
EFFECTS OF MR'S WHEN PRESENT NET VALUE IS MAXIMIZED,
SUBJECT TO NONDECLINING FLOW

<u>MR Mix</u>	<u>LTSY</u> <u>(MMCF)</u>	<u>1st Decade ASQ</u> <u>(MMCF/YR)</u>	<u>PNV</u> <u>(MM\$)</u>
No MR's Included (Benchmark Run #3A)	37.8	34.2	1,635
Dispersion Included	37.3	30.1	1,413
Change from no MR's	-1.3%	-12.0%	-13.6%
Riparian MR's and Dispersion Included	36.5	29.0	1,350
Change from no MR's	-3.4%	-15.2%	-17.4%
Old Growth and Riparian MR's and Dispersion Included (Benchmark Run #7A)	34.6	28.0	1,262
Change from no MR's	-8.5%	-18.1%	-22.8%

Long-term sustained yield is reduced 8.5 percent when management requirements are imposed. The dispersion constraint had no effect on the number of acres of suitable timber lands. It did result in a very slight shift in prescription mix with somewhat fewer acres receiving precommercial thinning. This had a small impact on long-term sustained yield. Old-growth and riparian protection constraints reduced long-term sustained yield by reducing the number of suitable acres and utilizing timber management regimes with smaller contributions to long-term sustained yield.

First decade harvest levels were reduced by 18.1 percent when management requirements were added. The dispersion constraint accounted for much of this reduction. The dispersion constraint allows not more than 25 percent of an analysis area to be harvested per decade. Thus, many of the acres that would otherwise be harvested in the first decade are pushed back until later decades. These acres are replaced to a large extent with harvests on other analysis areas.

However, given the shifts of first decade harvest to other analysis areas, a lower level of first decade harvest better met the criterion of maximizing present net value. First decade harvest is reduced somewhat by the old-growth core areas being withdrawn from timber production. It is also reduced by the substitution of long rotation, extended shelterwood timber regimes for shorter rotation clearcuts. The effect on first decade harvest is more pronounced in this set of benchmarks than in those which were not subject to nondeclining flow. Impacts on harvest levels in later decades can reduce first decade harvests under nondeclining flow.

Present net value is reduced by 22.8 percent when management requirements are included. Much of this can be attributed to the delay in harvesting many of the acres with the highest contribution to present net value to meet dispersion constraints. Lower levels of timber harvest and introduction of higher cost prescriptions also have an impact.

Table B-VI-4 below, summarizes the effects of management requirements when timber is maximized, subject to nondeclining flow. This set of benchmarks is formulated identically to the second set except for the objective function used. First decade timber harvest was first maximized. Timber harvest for the entire modeling horizon was then maximized, subject to meeting the first decade harvest level of the previous run. Present net value for the entire modeling horizon was then maximized, subject to meeting the harvest levels set in the previous two runs.

**TABLE B-VI-4
EFFECTS OF MR's WHEN TIMBER VOLUME IS MAXIMIZED,
SUBJECT TO NONDECLINING FLOW**

<u>MR Mix</u>	<u>LTSY (MMCF)</u>	<u>1st Decade ASQ (MMCF/YR)</u>	<u>PNV (MMS\$)</u>
No MR's Included (Benchmark Run #1A)	41.9	41.2	1,506
Dispersion Included	41.9	41.2	1,138
Change from no MR's	0%	0%	-24.4%
Riparian MR's and Dispersion Included	41.1	40.4	1,104
Change from no MR's	-1.9	-1.9%	-26.7%
Old Growth and Riparian MR's and Dispersion Included (Max Timber Benchmark)	39.2	38.5	1,069
Change from no MR's	-6.4%	-6.6%	-29.0%

Long-term sustained yield and first decade harvest are equal in all versions of this set of benchmarks. Both are reduced 6.4 percent when management requirements are imposed. Dispersion had no effect on these factors. Economically inefficient means of scheduling timber harvest were acceptable under the primary criteria of this run. All of the displaced harvest due to the dispersion constraint was replaced by harvests from other analysis areas. This did not happen in the benchmarks whose primary criterion was to maximize present net value. Dedicated old growth core areas reduced these factors by removing some tentatively suitable lands from the timber base. Managed old-growth and riparian protection areas utilize timber harvest regimes which have a smaller contribution to long-term sustained yield.

Present net value is reduced 29 percent when management requirements are added. The effect on present net value is less meaningful with this set of benchmarks than the previous two sets due to the difference in formulation. Timber maximization criteria are completely satisfied before present net value is considered.

3. Harvest Restrictions (95 percent CMAI)

Two versions of the present net value maximization benchmarks were tested for the impacts of harvest restrictions:

-Those with 20 percent sequential upper and lower bounds on timber flow (Benchmark Runs #4 and #5);

-Those with nondeclining flow (Benchmark Runs #6 and #7).

Benchmark Runs #5 and #7 have harvest restrictions until 95 percent of mean annual increment has been reached. Benchmark Runs #4 and #6 have no harvest restrictions other than meeting minimum merchantability limits.

Table B-VI-5 illustrates how selected outputs vary between these benchmarks.

**TABLE B-VI-5
EFFECT OF HARVEST RESTRICTIONS ON SELECTED OUTPUTS**

<u>Benchmark</u>	<u>LTSY (MMCF)</u>	<u>1st Decade ASQ (MMCF/YR)</u>	<u>PNV (MM\$)</u>
Run #4	33.2	32.8	2,239
Run #5	34.5	32.7	2,230
Change from #4 to #5	+3.9%	-0.3%	-0.4%
Run #6	33.5	29.9	2,132
Run #7	34.8	29.0	2,132
Change from #6 to #7	+3.9%	0%	0%

*for other decades see Table B-VI-12

Rotation ages prior to 95 percent CMAI were selected extensively in Benchmark Runs #4 and #6. This resulted in very few other differences between these sets of benchmarks, however. Long-term sustained yield is 3.9 percent higher in Benchmark Runs #5 and #6 due to the harvests occurring closer to CMAI. Long-term sustained yield has little effect on anything else in these benchmarks, however.

4. Nondeclining Flow

Two sets of the present net value maximization benchmarks were tested for the impacts of nondeclining flow constraints:

-Those with harvest when minimum utilization standards are reached (Benchmark Runs #4 and #6),

-Those with harvest at 95 percent CMAI (Benchmark Runs #5 and #7).

Benchmark Runs #4 and #5 have 20 percent upper and lower bounds on timber flow. Benchmark Runs #6 and #7 have nondeclining flow constraints. Table B-VI-6 illustrates how selected outputs vary between these benchmarks.

TABLE B-VI-6
EFFECT OF NONDECLINING FLOW ON SELECTED OUTPUTS

<u>Benchmark</u>	<u>LTSY</u> <u>(MMCF)</u>	<u>1st Decade ASQ</u> <u>(MMCF/YR)</u>	<u>PNV</u> <u>(MM\$)</u>
Run #4	33.2	32.8	2,239
Run #6	33.5	29.9	2,132
Change from #4 to #6	+0.9%	-8.6%	-4.6%
Run #5	39.5	32.7	2,230
Run #7	34.8	29.0	2,132
Change from #5 to #7	+0.9%	11.3%	-4.4%

* for other decades see Table B-VI-12

Imposition of nondeclining flow constraints results in a slight increase in long-term sustained yield. However, in the departure runs (Benchmark Runs #4 and #5) there is no direct link between long-term sustained yield and allowable sale quantity. There is a substantial decrease in first decade harvest and present net value with the imposition of nondeclining flow constraints. The four percent discount rate offers an incentive to capture as high a level of benefits as possible in the first decade when present net value is maximized. Nondeclining flow constraints limit the opportunity to do so.

5. Harvest Restrictions (95 Percent CMAI) and Nondeclining Flow in Combination

Two sets of the present net value maximization benchmarks were tested for the impacts of harvest restriction (95 percent CMAI) and nondeclining flow in combination:

- Those without management requirements (Benchmark Runs #2 and #3),
- Those with management requirements (Benchmark Runs #4 and #7).

Benchmark Runs #2 and #4 allow harvest when minimum utilization standards are reached and have 20 percent upper and lower bounds on timber flow. Benchmark Runs #3 and #7 have harvest at 95 percent CMAI and nondeclining flow constraints.

Table B-VI-7 illustrates how selected outputs vary between these benchmarks.

TABLE B-VI-7
EFFECT OF HARVEST RESTRICTIONS AND
NONDECLINING FLOW IN COMBINATION

<u>Benchmark</u>	<u>LTSY</u> <u>(MMCF)</u>	<u>1st Decade ASQ</u> <u>(MMCF/YR)</u>	<u>PNV</u> <u>(MM\$)</u>
Run #2	33.3	53.0	2,568
Run #3	38.0	34.3	2,497
Change from #2 to #3	+14.1%	-35.3%	-2.8%
Run #4	33.2	32.8	2,239
Run #7	34.8	29.9	2,132
Change from #4 to #7	+4.8%	-8.8%	-4.8%

* for other decades see Table B-VI-12

In benchmarks with management requirements, the impact of harvest restrictions and nondeclining flow in combination is very similar to that of nondeclining flow by itself. This is not surprising because harvest restrictions had very little impact alone. First decade harvest and present net value are higher without the constraints due to the incentive from the discount rate to accrue benefits as early as possible. This effect is much greater in benchmarks which do not contain management requirements.

6. Analysis of Price Trends and Costs

A one percent per year real price trend was applied to stumpage and a zero percent trend was applied to other resource values and costs in present net value calculations as per Regional direction. A sensitivity analysis was performed on these assumptions by running Benchmark Run #7A with zero, two, and three percent real price trends on stumpage as well as the one percent trend. Other resource values and costs remained at zero percent in all cases. Run #7A was used rather than Run #3A because it includes management requirements. Run #7A is formulated the most closely to an alternative of any of the benchmarks. A comparison of these four runs gives a good indication of the effects price trend assumptions have on land allocations and timber intensities selected when present net value is maximized.

This discussion will focus only on the timber resource because it is directly affected. Other resources are indirectly affected, however, by changes in timber harvest levels and intensities.

Table B-VI-8 illustrates the effect of price trends on timber volumes. The long-term sustained yield (LTSY) capacity increases slightly as price trends increase. This is due to two factors. The amount of economically suitable timber land increases with an increase in price trends as does the intensity of the timber management regimes selected.

**TABLE B-VI-8
EFFECT OF PRICE TRENDS ON TIMBER VOLUMES**

Price Trend	Allowable Sale Quantity (MMCF/YR)					LTSY (MMCF/YR)	Percent Change
	Decade 1	Decade 2	Decade 3	Decade 4	Decade 5		
0%	27.0	27.0	27.0	27.0	27.0	33.7	-2.6
1%	28.0	28.0	28.0	28.0	28.0	34.6	0
2%	16.4	33.0	33.0	33.0	33.0	35.1	+1.4
3%	15.7	32.4	35.5	35.5	35.5	36.4	+5.2

The effect on first decade harvest is more startling and counterintuitive. A zero percent trend results in a 3.6 percent decrease in first decade harvest compared with a one percent trend. A two percent and three percent trend result in 41 percent and 44 percent decreases in first decade harvest compared with a 1 percent trend. A high rate of growth for sawtimber in the first decade, particularly in the wet ecotypes, combined with the higher real price trends offset the incentive of the four percent discount rate to harvest as soon as possible.

The drop in first decade harvest levels is probably more a reflection of the structure of the Forest's FORPLAN model than a real reflection of the effects of price trends. Tentatively suitable timber lands are not broken out by either stocking levels or site productivity in the FORPLAN model because inventory data to do so was unavailable. The timber yields therefore reflect very broad averages across the Forest. For these "average timber stands" modeled in FORPLAN, deferring first decade harvest increased present net value at two and three percent price trends. However, the Forest in reality consists of many diverse stands, some of which would have been better deferred and some of which would have been better harvested in the first decade. It would probably be more accurate to ignore the counterintuitive first decade effects and concentrate on the trends from the second decade on.

Table B-VI-9 illustrates the effect of price trends on economic suitability of lands for timber production and the intensity of management regimes selected. Both of these factors correlate positively with an increase in price trends. The effect on suitability is much smaller than the effect on management intensity.

**TABLE B-VI-9
EFFECT OF PRICE TRENDS ON SUITABILITY AND MANAGEMENT INTENSITY**

Price Trends	Suitable Timber Lands (Acres)*	Average Annual Precommercial Thinning (Acres)	Average Annual Planting (Acres)
0%	713,991	1,045	4,133
1%	725,798	1,765	4,508
2%	726,158	3,536	5,211
3%	729,318	5,111	5,555

*791,899 acres were found to be tentatively suitable.

Economic suitability of lands for timber production does not appear to be very sensitive to price trend assumptions on this Forest. Choices of appropriate intensities of timber management regimes do seem highly sensitive to price trend assumptions. This is significant in that the level of timber management intensity affects the level of investments for precommercial thinning and the magnitude of the allowable sale quantity.

A sensitivity analysis similar to that done for price trends was done for variable costs contained in the Forest's FORPLAN model. Benchmark Run #7A was rerun once with 20 percent higher costs and once with 20 percent lower costs.

Table B-VI-10 illustrates the effect of cost assumptions on timber volumes. Long-term sustained yield decreases slightly with a 20 percent cost increase and increases slightly with a 20 percent cost decrease. First decade harvest is increased 13 percent with a 20 percent cost decrease, and is decreased 9 percent with a 20 percent cost increase.

**TABLE B-VI-10
EFFECT OF COST ASSUMPTIONS ON TIMBER VOLUMES**

Cost Level	Allowable Sale Quantity (MMCF/YR)					LTSY (MMCF/YR)	Percent Change
	Decade 1	Decade 2	Decade 3	Decade 4	Decade 5		
-20%	31.6	31.6	31.6	31.6	31.6	35.1	+1.4
Base	28.0	28.0	28.0	28.0	28.0	34.6	0
+20%	25.4	27.5	27.5	27.5	27.5	34.4	-0.6

Table B-VI-11 illustrates the effect of cost assumptions on economic suitability of lands for timber production and the intensity of management regimes selected. The effect on suitability is negligible. The effect on management intensity is much greater.

**TABLE B-VI-11
EFFECT OF COST ASSUMPTIONS ON SUITABILITY AND MANAGEMENT INTENSITY**

Cost Level	Suitable Timber Lands (Acres)*	Average Annual Precommercial Thinning (Acres)	Average Annual Planting (Acres)
-20%	726,159	3,759	5,490
Base	725,798	1,765	4,508
+20%	725,313	1,146	4,476

*791,899 acres were found to be tentatively suitable

Economic suitability does not appear to be very sensitive to cost assumptions. However, choice of management intensity does appear sensitive to cost assumptions. As was mentioned previously, choice of management intensity affects the level of investments in precommercial thinning and the magnitude of the allowable sale quantity.

7. Benchmark Summary

Table B-VI-12 summarizes the benchmarks in terms of selected outputs and effects. A more detailed display of benefits and costs by major resource groups can be found in Section VIII of this appendix.

**TABLE B-VI-12
BENCHMARK OUTPUT AND EFFECT SUMMARY (AVERAGE ANNUAL OUTPUTS)**

Output or Effect	BENCHMARK							Minimum Level	Maximum Timber	Maximum Unroaded Recreation	Current Mngmt
	Run #1	Run #2	Run #3	Run #4	Run #5	Run #6	Run #7				
Present Net Value (Million Dollars)	1902	2568	2497	2239	2230	2132	2132	-153	1850	1667	1976

VII. FORMULATION OF ALTERNATIVES

A. Overview

Each Forest Plan alternative is a unique combination of land allocations, management prescriptions, and activity schedules. As a result, each alternative would generate a different mix of goods, services, and environmental effects. According to NFMA (36 CFR 219.12f) alternatives must:

- be distributed within the minimum and maximum resource potentials to reflect to the extent practicable the full range of major commodity and environmental resource uses and values that would be produced from the Forest;
- reflect a range of resource outputs and expenditure levels;
- be formulated to facilitate analysis of opportunity costs, and of resource use and environmental trade-offs among alternatives and between alternatives and benchmarks;
- be formulated to facilitate evaluation of effects on present net value, benefits, and costs of achieving various outputs and nonpriced benefits;
- provide different ways to address and respond to major public issues, management concerns, and resource opportunities identified during the planning process;
- be formulated to require changes in existing laws and policies, to implement if reasonable and necessary, to address major public issues, management concerns, or resource opportunities;
- respond to and incorporate the RPA Program tentative resource objectives for the Forest in at least one alternative;
- reflect the current level of goods and services provided by the unit, and the highest level of goods and services that would be provided in the future if current management direction continues in at least one alternative (the “no action” alternative pursuant to NEPA);
- represent, to the extent practicable, the most cost efficient combination of management prescriptions examined that can meet the objectives established in each alternative;
- state the condition and uses that will result from long-term application of the alternative,
- state what goods and services will be produced, including timing and flow of outputs, and associated costs and benefits;
- state resource management standards and guidelines,
- state the purposes of the proposed management direction.

Formulation of Alternatives, planning step five, followed the Analysis of the Management Situation. Benchmarks from this analysis defined the range within which alternatives were developed. In addition, five alternatives were required:

-Current Direction (No Action): This is the alternative of “no-action” required by the Council of Environmental Quality (CEQ) regulations (40 CFR 1502.14). This alternative would continue the management of the Forest as defined by existing direction in approved

management plans. It assumes continuation of existing policies, standards, and guidelines; current budget levels updated for changing costs over time; and, to the extent possible, production of current levels and mixes of resource outputs.

Alternative A/NFMA is the current direction alternative (or the “no-action” alternative) in this FEIS.

-Emphasis on the Current RPA Program: This alternative will determine how the current (1980) RPA program distributed to the Forest through the Regional Guide could best be implemented.

Alternative B is the current RPA program alternative in this FEIS.

-Emphasis on Market Opportunities: This alternative has an emphasis on outputs that have an established market price (timber, livestock forage, commercial fish, developed recreation opportunities, and minerals). Management for other resources will be at economically and environmentally feasible levels consistent with the emphasis on market-oriented outputs.

Alternative D is the alternative in this FEIS which emphasizes market opportunities.

-Emphasis on Non-Market Opportunities: This alternative has an emphasis on amenity outputs such as visuals, dispersed recreation and roadless areas. Management for other resources will be at economically and environmentally feasible levels consistent with the emphasis on non-market outputs.

Alternative E is the alternative in this FEIS which emphasizes non-market opportunities.

-Emphasis on Dispersed Unroaded Recreation and Intensified Management: This alternative designates a large portion of the roadless areas on the Forest as dispersed unroaded recreation while increasing commodity production on those areas already roaded. Its purpose is to balance the economic effects of not beginning commodity production in roadless areas. It also attempts to reduce potential cumulative effects of management activities on National Forest and adjacent forest lands.

Alternative G is the alternative which best emphasizes dispersed unroaded recreation and intensified management in this FEIS.

-Departure Alternative: One alternative is a “departure” alternative. It has the same land allocation and resource management prescriptions as the alternative that it was based upon. However, the timber harvest schedule has been modified from the base sale schedule which resulted in nondeclining flow of timber, never exceeding the long-term sustained yield capacity of the Forest. In most cases, management under a departure alternative results in higher volumes of timber harvested in the near future and lower volumes of timber available in the intermediate future. The ability of the Forest to produce timber in the long run is no less than that of the alternative upon which the departure was based.

Alternative I is the departure alternative in this FEIS.

The process used to derive alternatives is outlined below as a series of steps. Some of these took place concurrently.

-Major public issues, management concerns, and opportunities were identified through public and internal meetings and Forest Plan Reports. See Appendix A for additional detail.

-A comprehensive multi-resource data base was formed based on the identified issues and concerns and stored in a computer mapping system.

-A set of management prescriptions was prepared to represent a variety of possible ways and intensities to manage the Forest in response to the issues, concerns, and opportunities. These prescriptions represent the most cost efficient set of activities which meet the goals and objectives of each prescription.

-Analysis areas which represent similar physical and biological attributes were identified and mapped. The capability, suitability, and management opportunities of specific areas of the Forest were considered in this step.

-A determination of the appropriate management prescriptions for consideration on each analysis area was made.

-The costs of applying management prescriptions to analysis areas, and the outputs and resource values which would result, were estimated.

-Demand for various outputs was estimated.

-A FORPLAN model was developed for the Forest incorporating the information developed in the preceding steps. A detailed description of the FORPLAN model is found in Section III of this Appendix.

-During the Analysis of the Management Situation, supply potentials were determined using the FORPLAN computer model and other techniques. Various assumptions, constraints, and objectives were used to establish benchmarks for supply potentials of each resource. A benchmark was established for maximum present net value. Existing resource supply and projected demand was compared. Opportunities to resolve issues and management concerns were explored by comparing existing and projected demand to potential production levels. These potentials, when compared to the Current Direction, indicate opportunities and/or need for change.

-Alternative goals and objectives were established to provide a broad range of options for future management of the Forest and to provide a broad range of responses to the Forest's planning problems.

-Seven alternative land allocations (Alternatives A/NFMA, C, D, E, F, G and J) were mapped to meet the goals and objectives established above. These alternatives, as well as Alternatives B, H, and I, are described in detail in Chapter II of this FEIS. These land allocations were modeled in FORPLAN. Additional objectives were modeled as constraints. FORPLAN computer runs were made on these alternatives using an objective function of maximization of present net value over the 15 decade modeling horizon. This objective function was the final one used for all alternatives to assume that the most cost efficient solution possible, given the other goals and objectives of the alternatives, was achieved.

-Other RPA targets could be more easily met. The land allocation developed for Alternative D, the commodity emphasis alternative, was used in conjunction with a maximize timber FORPLAN constraint, subject to this and other resource constraints, to produce Alternative B, the RPA alternative.

-A version of the current management alternative that harvested as much timber as the current Timber Management Plan for the Forest was desired. The Alternative A/NFMA land allocation, which reflects current management projected into the future was used in FORPLAN with an objective of timber maximization to find the highest level of timber production possible under the current land allocation. The three step process described above for Alternative G was used. The level of timber harvest called for in the Timber Management Plan was found to be unobtainable. The attempt to meet it was carried forward as a viable alternative however, Alternative H.

-Alternative I was developed as a departure based on Alternative C, the preferred alternative. A number of departures from the base sale schedule developed for Alternative C were examined. The version that emerged as Alternative I has a first decade harvest level equal to the average quantity sold during the period FY 1975 through FY 1984. This gradually declines to the harvest level found in Alternative C.

Alternative NC may not meet the requirements of 36 CFR 219.12(f). It was not formulated in a manner that facilitates analysis of opportunity costs, resource uses, and environmental tradeoffs compared to other alternatives. It was not formulated in a manner that permits evaluation of present net value or the benefits and costs of achieving various outputs and non-priced benefits. Alternative NC does not necessarily represent the most cost efficient combination of management prescriptions to meet the objectives of the alternative. It is not possible with this alternative to project the flow of goods and services beyond the first decade. Resource management Standards and Guidelines for the No Change Alternative are contained in several documents including the 1963 and 1969 Timber Management Plans, the District Multiple Use Plans, and the Chelan and Kittitas Unit Plans. Direction in these documents is not integrated, thus resource outputs are often unattainable.

B. Constraints Common to all Alternatives

Some constraints and prescriptions were common or constant in all the alternatives. These were necessary to meet planning requirements, existing laws or policies, or the objectives of prescriptions. First is a discussion of those items which were constant. Next is a discussion of those that were common, but the amount of area they applied to varied by alternative.

1.Constraint: Some areas on the Forest will not vary by alternative. These include congressionally designated wilderness, two established research natural areas, and the Entiat Experimental Forest.

Purpose: To perpetuate and protect the values and resources for which these areas were established.

Rationale: The management of these areas was well established and we did not have the authority to consider a wide range of choices or prescriptions.

Tradeoff: Impacts of this assumption were not analyzed because it was beyond the scope of this planning process. Also, detailed inventory data did not exist for wilderness areas established

prior to 1984. Present net value and commodity production would increase if this constraint was removed; amenity production would decrease. The amounts are unquantified, however.

2.Constraint: The Alpine Lakes Management Unit will be managed as directed by the Alpine Lakes Area Land Management Plan in all alternatives.

Purpose: Maintain the direction recently developed for the area as directed by the Alpine Lakes Area Management Act of 1976.

Rationale: A congressionally mandated study produced a management plan for the area in 1981. This plan was an interdisciplinary product with a great deal of public involvement. Incorporation of the direction provided in special area plans, such as this, into the Forest Plan is in accordance with 36 CFR 219.2(b).

Tradeoff: The impact of this constraint would vary among alternatives. It was tested against the maximum PNV benchmark (Benchmark Run #7). Present net value decreased by four percent and allowable sale quantity decreased by seven percent when this constraint was added. Un-roaded recreation capacity was increased in the long-run but not in the first decade. Effects on other resources was minor.

3.Constraint: Timber harvest can be scheduled only on lands classified as tentatively suitable for timber harvest through the Stage I suitability analysis. See Chapter III, of this FEIS for acreages.

Purpose: To meet the timber resource land suitability requirements of NFMA (36 CFR 219.14).

Rationale: The Allowable Sale Quantity (ASQ) must be determined using only tentatively suitable lands.

Tradeoff: Impacts of this assumption were not analyzed. Adequate data did not exist to predict timber yields from much of the unsuitable lands.

4.Constraint: All alternatives except Alternative I have nondeclining flow constraints on sawtimber. This means that the harvest in any given decade cannot be less than that of the preceding decade.

Purpose: To meet the timber scheduling requirements of NFMA [36 CFR 219.16(a)(1)].

Rationale: To provide a steady supply of timber.

Tradeoff: The impact of this constraint would vary among alternatives. It was tested against the maximum PNV benchmark (Benchmark Run #7). It resulted in a three percent reduction in PNV, a nine percent reduction in first decade allowable sale quantity, and a two percent increase in total allowable sale quantity over 150 years.

5.Constraint: The harvest level of the last harvest period will be less than or equal to long-term sustained yield (all alternatives except Alternative I).

Purpose: To meet the timber scheduling requirements of NFMA [36 CFR 219.16(a)(1)].

Rationale: This constraint, in combination with the nondeclining flow constraint, insures that timber harvest will never exceed the long-term ability of the Forest to supply timber.

Tradeoff: The impact of this constraint was not analyzed separately. It was analyzed in conjunction with the nondeclining flow constraint discussed above. Allowable sale quantity exceeded long-term sustained yield capacity in 4 out of 15 decades in Benchmark Run #5 (Maximum PNV benchmark without constraints for nondeclining flow, never to exceed long-term sustained yield capacity). This constraint may reduce PNV and allowable sale quantity in certain decades but the actual amounts are unquantified.

6.Constraint: Control the amount of inventory volume left at the end of the planning horizon.

Purpose: Assure that the total inventory volume left at the end of the planning horizon will equal or exceed the volume that would occur in a regulated forest.

Rationale: The ending inventory constraint controls age class distribution through the planning horizon to assure the base harvest schedule concludes with a regulated volume in perpetuity.

Tradeoff: PNV and allowable sale quantity may be reduced in certain decades due to maintaining the proper age class distribution for future harvests. The specific impacts are unquantified, however.

7.Constraint: Timber stands could not be scheduled for harvest prior to reaching 95 percent of culmination of mean annual increment (CMAI).

Purpose: To comply with the NFMA regulations [36 CFR 219.16(a)(2)(iii)].

Rationale: Timber stands could potentially be scheduled for harvest as soon as they met minimum merchantability requirements, particularly under an objective of PNV maximization.

Tradeoff: The impact of this constraint would vary among alternatives. It was tested against the maximum PNV benchmark (Benchmark Run #7). This constraint delayed timber harvest by at least one decade in most stands which were not already beyond 95 percent of CMAI. This had an insignificant effect on PNV and all outputs other than long-term sustained yield capacity which increased by four percent. This is due to older stands with more volume per acre being harvested.

8.Constraint: A dispersion constraint was used in all alternatives to achieve cutting unit sizes that did not exceed 40 acres in size and left logical cutting units in between.

Purpose: To comply with the NFMA regulations [36 CFR 219.27(d) and (f)].

Rationale: The model potentially could have harvested an entire analysis area in one decade without such a constraint.

Tradeoff: The impact of this constraint would vary among alternatives. It resulted in a 14 percent reduction in PNV and a 12 percent reduction in first decade allowable sale quantity when added to Benchmark Run #3 (maximum PNV benchmark without MMR's). It resulted in a 24 percent reduction in PNV but had no effect on first decade allowable sale quantity when added to Benchmark Run #1 (maximum timber benchmark without MMR's). Visual quality, recreational settings, wildlife habitat, sedimentation, and water quality would be adversely affected without the constraint. However, these factors are not quantified in the PNV calculation.

9.Constraint: The Riparian-Aquatic Habitat Protection Zone (EW-2) Prescription was applied to a variable width area around riparian zones. See the Forest-wide Standards and Guideline and Management Prescriptions in the Forest Plan for a detailed description.

Purpose: To meet management requirements for soil and water [36 CFR 219.27(e)].

Rationale: Less intensive management practices than might otherwise be applied are necessary in these areas to meet management requirements.

Tradeoff: The impact of this constraint would vary among alternatives. It resulted in a four percent reduction in first decade allowable sale quantity when added to Benchmark Run #3 (maximum PNV benchmark without MR's). It resulted in a two percent reduction in both PNV and first decade allowable sale quantity when added to Benchmark Run #1 (maximum timber benchmark without MR's). The additional costs associated with this constraint are included in the PNV calculation. However, the benefits are not. They must be considered as subjective additions to present net benefits.

10.Constraint: Old-growth/mature units are dedicated and managed according to Regional guidelines for distribution and amount to meet management requirements for old-growth/mature dependent species. See the Old-Growth Dependent Species (OG-1) and Mature (OG-2) Prescription in the Forest Plan for a detailed description.

Purpose: To meet management requirements for old-growth dependent species [36 CFR 219.27(e)].

Rationale: Old-growth units of the proper size and distribution might not have been maintained without this constraint. This was the most efficient way to meet management requirements for old-growth dependent species.

Tradeoff: The impact of this constraint would vary among alternatives. It resulted in a five percent reduction in PNV and a three percent reduction in first decade allowable sale quantity when added to Benchmark Run #3 (maximum PNV benchmark without MMR's). It resulted in a two percent reduction in PNV and a five percent reduction in first decade allowable sale quantity when added to Benchmark Run #1 (maximum timber benchmark without MMR's). Impacts would be smaller for alternatives than for benchmarks because some of the areas assigned to the Old-Growth/Mature Species Prescription would already be assigned to prescriptions which either do not harvest timber or utilize similar silvicultural systems.

11.Constraint: Harvest scheduling constraints were applied to Scenic Travel-Retention (ST-1) and Scenic Travel-Partial Retention (ST-2) Prescriptions in every alternative. The constraints were the same in every alternative; however, the amount of area that they applied to varied widely among alternatives. No more than 7.2 percent of the area allocated to the Scenic Travel-Retention Prescription or 10 percent of the area allocated to the Scenic Travel-Partial Retention Prescription could be harvested in any given decade.

Purpose: To meet the visual quality objectives of the prescriptions.

Rationale: The model could have scheduled a level of timber harvest that would not have met the objectives of these prescriptions without the constraints.

Tradeoff: There is no tradeoff involved with this constraint. It is part of the definition of the two prescriptions. Tradeoffs do occur when either of these prescriptions are allocated to the ground. Timber yields and PNV are reduced compared to some prescriptions. Visual quality and many other nonpriced benefits are enhanced, however.

None of the common constraints were applied during the development of Alternative NC.

The items discussed above were common to all the alternatives. The variation in the alternatives occurred largely as a result of applying different management prescriptions to different areas of the Forest.

C. Development of Alternatives

Benchmarks defined the minimum and maximum output levels of Forest resources and the outputs associated with current management. The maximum PNV benchmark (Benchmark Run #7) identified the most efficient land allocation and schedule of activities and outputs, given the information quantified in FORPLAN. This provided a starting point for the formulation of each alternative. Land allocations and output levels were varied by alternative to better resolve mixes of issues, concerns, and opportunities. This resulted in a decrease in present net value compared to the maximum PNV benchmark. However, many of the changes which lower PNV result in increases in net public benefits due to improving factors which are not valued in the PNV calculation. The constraints associated with each alternative reflect the Forest Management Team's best estimate of the most cost efficient method of achieving the goals and objectives of the alternative.

The following discussions focus on the development of each alternative. Numerous iterations occurred for some alternatives where prescriptions or schedules were adjusted to better accomplish goals and objectives. The results of these runs are on file in the planning records at the Wenatchee National Forest Supervisor's Office. The final sets of constraints and objectives for each alternative follow. Detailed descriptions of the alternatives are found in Chapter II of this FEIS.

Alternative NC was developed by a very different process than any other alternative. Alternative NC is based upon timber outputs prescribed in the 1963 and 1969 Timber Management Plans and upon management direction contained in other plans listed in Chapter I of the FEIS and in Section VI of Appendix B. Unlike other alternatives, interactive testing of various prescriptions and schedules was not done during development of the NC Alternative.

1. Alternative A/NFMA

This is the no action alternative. It was formulated to maintain the current management direction for the Forest. Sources of that direction were the Alpine Lakes Area Land Management Plan, the Chelan and Kittitas Unit Plans, and Ranger District multiple use plans. Alternative A/NFMA portrays how these plans would influence the flow of goods and services over the life of this plan (10-15 years) based upon the use of current National Forest Management Act of 1976 (NFMA) planning data. It also approximates the current budget.

This alternative does meet the management requirements for that habitat as presently required for NFMA planning.

a. The criteria and assumptions underlying the development of this alternative are:

- Achieve the common alternative constraints discussed earlier.
- Simulate the management most likely to be carried out into the future if current direction is followed.
- Land allocation is defined by currently approved plans (Alpine Lakes Area Land Management Plan, the Chelan and Kittitas Unit Plans, and Ranger District Multiple Use Plans).
- Meets minimums for old-growth dependent species as required by NFMA.
- Visual quality objectives reflect the current management of the Forest.
- Suitability for timber production is based on latest study, not the currently approved Timber Management Plan.
- The Dispersed Recreation, Unroaded, Motorized (RE-2) Prescription was not split into trail bike versus four-wheel-drive areas.
- The Classified Special Areas - Scenic and/or Recreation (SI-1) Prescription was applied to the portion of the Chelan Scenic Study Area which remains outside of wilderness.
- The Chiwawa and White Rivers, and a portion of the Wenatchee River, are proposed for classification under the Wild and Scenic Rivers Act.

b. In addition to the common alternative constraints, the constraints utilized to meet the criteria and assumptions are:

(1)Constraint: Prescriptions were constrained to analysis areas to reflect the current land allocation. The acreage by management prescription is shown below.

<u>Management Prescription</u>	<u>Acre</u>
Water	7,780
EF-1	4,770
EW-1	17,151
EW-2	53,849
GF	393,306
OG-1	66,823
OG-2	56,074
RE 1	4,494
RE-2a/RE-2b	64,597
RE-3	59,551
RM-1	33,708
RN-1	1,717
SI-1	136,911
SI-2	382
ST-1	125,484
ST-2	286,733
WI-1	841,034
WS-1	6,742
WS-2	3,074
WS-3	6,636

Purpose: This allocation depicts the current management situation.

Rationale: This alternative simulates the current management of the Forest projected into the future.

Tradeoff: Present net value is reduced by 7.3 percent compared to the maximum PNV benchmark (Benchmark Run #7). Many factors which are not accounted for in the PNV calculation are significantly improved. Table II-3a in Chapter II of this FEIS presents a wide range of outputs and effects for this alternative and the maximum PNV benchmark. The differences between them are due to differences in land allocations.

<u>FORPLAN Run</u>	<u>Discounted PNV (\$MM)</u>	<u>Discounted Costs (\$MM)</u>	<u>1st Decade Benefits (\$MM)</u>	<u>ASQ (MMCF/YR)</u>
Benchmark Run #7 (Maximum PNV)	2,132	266	2,398	29.9
Alternative A/NFMA with land alloca- tion constraints	1,976	329	2,305	21.8

2. Alternative B

This alternative was developed in an attempt to meet the 1980 Resources Planning Act program which has been assigned to the Forest through the Regional Guide.

The 1980 RPA timber target strongly influenced our approach. This alternative uses the Alternative D land allocations. It portrays the Forest's maximum timber producing capability while considering other resource needs. This alternative would result in the second greatest amount of development of the Forest.

a. The criteria and assumptions underlying the development of this alternative are:

- Achieve the common alternative constraints discussed earlier.
- Achieve 1980 RPA targets as allocated to the Forest by the Regional Guide.
- Expansion could take place at Chelan, Chinook Pass, Mission Ridge, and White Pass ski areas.
- No rivers are recommended for classification study under the Wild and Scenic Rivers Act.
- All tentatively suitable timber lands were assigned to General Forest Management Prescriptions, except where there were too small and isolated to be manageable or in the most critical travel corridors.

-Blue Slide, Rimrock, and Goose Egg Mountain proposed Geological Areas and the Lake Creek proposed Botanical Area are assigned to the Classified Special Interest Area - Other (SI-2) Prescription.

b. In addition to the common alternative constraints, the constraints utilized to meet the criteria and assumptions are:

(1)Constraint: Prescriptions are constrained to analysis areas to reflect a high commodity emphasis (same land allocation as Alternative D). The acreage by management prescription is shown below.

<u>Management Prescription</u>	<u>Acre</u>
Water	7,780
EF-1	4,770
EW-1	77,784
EW-2	58,046
GF	613,344
OG-1	71,063
OG-2	55,671
RE 1	8,544
RE-2a	69,706
RE-2b	7,865
RE-3	84,462
RM-1	81,663
RN-1	2,247
SI-1	72,950
SI-2	2,056
ST-1	55,163
ST-2	50,032
WI-1	841,034
WS-1	0
WS-2	0
WS-3	0

Purpose: This allocation reflects a high commodity emphasis which is feasible to implement.

Rationale: The RPA target which was most difficult to achieve was timber production. The land allocation which emphasized timber production was the most logical starting point in developing this alternative.

Tradeoff: Present net value is reduced by nine percent compared to the maximum PNV benchmark (Benchmark Run #7). Many factors which are not accounted for in the PNV calculation are significantly improved. Table II-3a in Chapter II of this FEIS presents a wide range of outputs and effects for this alternative and the maximum PNV benchmark. The differences between them are due to differences in land allocations and the harvest constraint described below.

<u>FORPLAN Run</u>	<u>PNV (\$MM)</u>	<u>Discounted Costs (\$MM)</u>	<u>Discounted Benefits (\$MM)</u>	<u>1st Decade ASQ (MMCF/YR)</u>
Benchmark Run #7 (Maximum PNV)	2,132	266	2,398	29.9
Alternative B with land allocation constraints	1,756	503	2,259	33.5

3. Alternative C

This alternative is an attempt to adjust the current direction (Alternative A) to a land allocation which would maximize net public benefits and would provide a balanced program in response to the issues and concerns.

Alternative C allocates many more acres to key big game range, increases the acreage allocated to roadless management, and provides greater protection of the scenic values.

a. The criteria and assumptions underlying the development of this alternative are:

-Achieve the common alternative constraints discussed earlier.

-Resolve problems identified by the Forest Management Team with the current land allocation.

-Segments of the American, Chiwawa, Cle Elum, Entiat, Icicle, Napeequa, Waptus, Wenatchee, and White Rivers are recommended for classification under the Wild and Scenic Rivers Act.

-Expansion could take place at Chinook Pass, Mission Ridge, and White Pass ski areas.

b. In addition to the common alternative constraints, the constraints utilized to meet the criteria and assumptions are:

(1)Constraint: Prescriptions were constrained to analysis areas to resolve problems perceived with the current land allocation. The acreage by management prescription is shown below.

<u>Management Prescription</u>	<u>Acres</u>
Water	7,780
EF-1	4,770
EW-1	118,742
EW-2	47,361
EW-3	19,059
GF	389,089
OG-1	79,840
OG-2	49,015
RE 1	6,021
RE-2a	79,607
RE-2b	16,748
RE-3	116,092
RE-4	6,614
RM-1	17,702
RN-1	2,247
SI-1	70,512
SI-2	2,798
ST-1	83,635
ST-2	174,880
WI-1	841,034
WS-1	5,554
WS-2	11,363
WS-3	23,426
MP-1	13,717

Purpose: This allocation reflects corrections of problems that the Forest Management Team perceived with the current land allocation. It resolves issues, concerns, and opportunities as perceived by the Forest Management Team.

Rationale: The Forest Management Team has a vast amount of on-the-ground experience on the Wenatchee. This alternative captures their knowledge of the capability of the Forest to resolve issues, concerns, and opportunities.

Tradeoff: Present net value is reduced by 10.4 percent compared to the maximum PNV benchmark (Benchmark Run #7). Many factors which are not accounted for in the PNV calculation are significantly improved. Table II-3a in Chapter II of this FEIS presents a wide range of outputs and effects for this alternative and the maximum PNV benchmark. The differences between them are due to differences in land allocations.

<u>FORPLAN Run</u>	<u>PNV (\$MM)</u>	<u>Discounted Costs (\$MM)</u>	<u>Discounted Benefits (\$MM)</u>	<u>1st Decade ASQ (MMCF/YR)</u>
Benchmark Run #7 (Maximum PNV)	2,132	266	2,398	29.9
Alternative C	1,910	409	2,319	24.3

4. Alternative D

This alternative emphasizes the production of resources such as timber, range forage, developed recreation, minerals, and other resources which have the potential to return revenue to the Federal Treasury and local Counties. Management of other resources is at economically and environmentally feasible levels consistent with the emphasis on market oriented outputs.

The Forest was assisted in the development of this alternative by local representatives of the timber industry.

a. The criteria and assumptions underlying the development of this alternative are:

-Achieve the common alternative constraints discussed earlier.

-Expansion could take place at Chelan, Chinook Pass, Mission Ridge, and White Pass ski areas.

-No rivers are recommended for classification under the Wild and Scenic Rivers Act.

-All tentatively suitable timber lands were assigned to General Forest Management Prescriptions except where they were too small and isolated to be manageable and the most critical travel corridors.

-Blue Slide, Rimrock, and Goose Egg Mountain proposed Geological Areas, and the Lake Creek proposed Botanical Area are assigned to the Classified Special Interest Area - Other (SI-2) Prescription.

-The area along the south side of Lake Chelan is assigned to the Key Big Game Habitat (EW-1) Prescription.

b. In addition to the common alternative constraints, the constraints utilized to meet the criteria and assumptions are:

(1)Constraint: Prescriptions are constrained to analysis areas to reflect a high commodity emphasis. The acreage by management prescription is shown below.

<u>Management Prescription</u>	<u>Acres</u>
Water	7,780
EF-1	4,770
EW-1	77,784
EW-2	58,046
GF	613,344
OG-1	71,063
OG-2	55,671
RE 1	8,650
RE-2a	69,706
RE-2b	7,865
RE-3	84,462
RM-1	81,663
RN-1	2,247
SI-1	72,950
SI-2	2,056
ST-1	51,163
ST-2	50,032
WI-1	841,034
WS-1	0
WS-2	0
WS-3	0

Purpose: This allocation reflects a high commodity emphasis which is feasible to implement.

Rationale: This land allocation is shifted as far towards a commodity emphasis as possible, while still remaining implementable.

Tradeoff: Present net value is reduced by nine percent compared to the maximum PNV benchmark (Benchmark Run #7). Many factors which are not accounted for in the PNV calculation are significantly improved. Table II-3a in Chapter II of this FEIS presents a wide range of outputs and effects for this alternative and the maximum PNV benchmark. The differences between them are due to differences in land allocations.

<u>FORPLAN Run</u>	<u>PNV (\$MM)</u>	<u>Discounted Costs (\$MM)</u>	<u>Discounted Benefits (\$MM)</u>	<u>1st Decade ASQ (MMCF/YR)</u>
Benchmark Run #7 (Maximum PNV)	2,132	266	2,398	29.9
Alternative D	1,937	410	2,347	25.6

5. Alternative E

This alternative allocates all currently roadless areas, outside of the existing wilderness and the Alpine Lakes Management Area, to a management prescription which will maintain their roadless status. It also emphasizes the protection of natural scenery, fish and wildlife habitat, and other amenity values. Management of other resources would be at economically and environmentally feasible levels consistent with the emphasis on amenity values.

a. The criteria and assumptions underlying the development of this alternative are:

-Achieve the common alternative constraints discussed earlier.

-Retain roadless character of all inventoried roadless areas outside of the Alpine Lakes Management Area and the Entiat Experimental Forest.

-Balance the areas assigned to unroaded management between motorized and non-motorized recreation opportunities.

-Segments of the American, Chiwawa, Cle Elum, Entiat, Icicle, Napeequa, Waptus, Wenatchee and White Rivers are recommended for classification under the Wild and Scenic Rivers Act.

-The Lake Creek proposed Botanical Area is assigned to the Classified Special Interest Area - Other (SI-2) Prescription.

-Retain natural appearing landscapes, particularly where viewed from roads and trails.

b. In addition to the common alternative constraints, the constraints utilized to meet the criteria and assumptions are:

(1)Constraint: Prescriptions are constrained to analysis areas to reflect a high amenity emphasis. The acreage by management prescription is shown below.

<u>Management Prescription</u>	<u>Acres</u>
Water	7,780
EF-1	4,770
EW-1	148,083
EW-2	37,206
GF	153,956
OG-1	62,901
OG-2	14,862
RE 1	4,388
RE-2a	94,002
RE-2b	38,754
RE-3	320,038
RM-1	6,106
RN-1	2,247
SI-1	74,010
SI-2	6,402
ST-1	185,544
ST-2	132,816
WI-1	841,034
WS-1	14,416
WS-2	3,816
WS-3	26,926
MP-1	8,459

Purpose: This land allocation has a strong amenity emphasis, with 100 percent of the inventoried roadless area outside of the Alpine Lakes Management Area and the Entiat Experimental Forest allocated to unroaded management.

Rationale: This land allocation is shifted as far towards an amenity emphasis as possible, while still remaining implementable.

Tradeoff: Present net value is reduced by 14 percent compared to the maximum PNV benchmark (Benchmark Run #7). Many factors which are not accounted for in the PNV calculation are significantly improved. Table II-3a in Chapter II of this FEIS presents a wide range of outputs and effects for this alternative and the maximum PNV benchmark. The differences between them are due to the land allocation.

<u>FORPLAN Run</u>	<u>PNV (\$MM)</u>	<u>Discounted Costs (\$MM)</u>	<u>Discounted Benefits (\$MM)</u>	<u>1st Decade ASQ (MMCF/YR)</u>
Benchmark Run #7 (Maximum PNV)	2,132	266	2,398	29.9
Alternative E	1,834	368	2,202	12.9

6. Alternative F

This alternative emphasizes unroaded recreation, protection of natural scenery, fish and wildlife habitat, and other amenity values. It allocates approximately 80 percent of the currently inventoried roadless area outside of the existing wilderness and Alpine Lakes Management Area to roadless management prescriptions with heavy emphasis to non-motorized recreation. Management of other resources would be at economically and environmentally feasible levels consistent with the emphasis on amenity values.

The Forest was assisted in the development of this alternative by a coalition of environmental groups from throughout the state.

a. The criteria and assumptions underlying the development of this alternative are:

- Achieve the common alternative constraints discussed earlier.
- Retain roadless character of approximately 82 percent of the inventoried roadless areas outside of the Alpine Lakes Management Area and the Entiat Experimental Forest.
- Emphasize non-motorized recreation opportunities in the areas assigned to unroaded management.
- Segments of the American, Chiwawa, Cle Elum, Entiat, Icicle, Nepeequa, Waptus, Wenatchee and White Rivers are recommended for classification under the Wild and Scenic Rivers Act.
- The Domke Lake area is allocated to non-motorized use in this alternative only.
- Expansion could take place at Chinook Pass and White Pass ski areas.

-Rimrock, Goose Egg Mountain, and Kloochman Rock proposed Geological Areas, and the Lake Creek proposed Botanical Area are assigned to the Classified Special Interest Area - Other (SI-2) Prescription.

-The Bumping Lake corridor is assigned to the Classified Special Interest Area - Scenic and/or Recreation (SI-1) Prescription.

-An area in the Little Wenatchee River drainage is assigned to the Old-Growth Management (OG-1) Prescription, in addition to the areas needed to meet management requirements.

b. In addition to the common alternative constraints, the constraints utilized to meet the criteria and assumptions are:

(1) **Constraint:** Prescriptions are constrained to analysis areas to reflect an unroaded, non-motorized emphasis. The acreage by management prescription is shown below.

<u>Management Prescription</u>	<u>Acres</u>
Water	7,780
EF-1	4,770
EW-1	140,083
EW-2	39,793
GF	202,949
OG-1	69,028
OG-2	15,688
RE 1	7,356
RE-2a	91,373
RE-2b	38,754
RE-3	259,088
RM-1	7,166
RN-1	2,247
SI-1	74,010
SI-2	6,233
ST-1	167,842
ST-2	147,129
WI-1	841,034
WS-1	15,561
WS-2	3,752
WS-3	26,776
MP-1	13,102

Purpose: This land allocation emphasizes unroaded non-motorized recreation opportunities, with 80 percent of the inventoried roadless area outside of the Alpine Lakes Management Area and the Entiat Experimental Forest allocated to unroaded management.

Rationale: This land allocation was developed with the cooperation of various environmental groups. It has a strong unroaded, non-motorized emphasis, while still remaining implementable.

Tradeoff: Present net value is reduced by 11 percent compared to the maximum PNV benchmark (Benchmark Run #7). Many factors which are not accounted for in the PNV calculation are significantly improved. Table II-3a in Chapter II of this FEIS presents a wide range of outputs and effects for this alternative and the maximum PNV benchmark. The differences between them are due to the land allocation.

<u>FORPLAN Run</u>	<u>PNV (\$MM)</u>	<u>Discounted Costs (\$MM)</u>	<u>Discounted Benefits (\$MM)</u>	<u>1st Decade ASQ (MMCF/YR)</u>
Benchmark Run #7 (Maximum PNV)	2,132	266	2,398	29.9
Alternative F	1,897	312	2,209	13.6

7. Alternative G

This alternative is an attempt to balance the land allocations between amenity and commodity production emphases. Of the currently roadless areas outside of existing wilderness and the Alpine Lakes Management Area which are suitable for timber production, approximately half was allocated to roadless management with a heavy emphasis toward motorized recreation and the remainder was allocated to commodity production.

The Forest was assisted in the development of portions of this alternative by representatives of off-road vehicle users groups from throughout the State.

a. The criteria and assumptions underlying the development of this alternative are:

- Achieve the common alternative constraints discussed earlier.
- Retain roadless character of approximately 69 percent of the inventoried roadless areas outside of the Alpine Lakes Management Area and the Entiat Experimental Forest.
- Emphasize motorized recreation opportunities in the areas assigned to unroaded management.
- The Chiwawa and White Rivers and a portion of the Wenatchee River are recommended for classification under the Wild and Scenic Rivers Act.
- Expansion could take place at Chinook Pass, Mission Ridge, and White Pass ski areas
- The Lake Creek proposed Botanical Area is assigned to the Classified Special Interest Area - Other (SI-2) Prescription.
- A corridor along the south side of Lake Chelan is allocated to the Dispersed Recreation, Unroaded, Motorized (RE-2a) Prescription so that a bike trail is not precluded.
- Washington State Department of Wildlife recommendations for wildlife are incorporated.

b. In addition to the common alternative constraints, the constraints utilized to meet the criteria and assumptions are:

(1)Constraint: Prescriptions are constrained to analysis areas to reflect an unroaded, motorized emphasis. The acreage by management prescription is shown below.

<u>Management Prescription</u>	<u>Acres</u>
Water	7,780
EF-1	4,770
EW-1	146,493
EW-2	47,573
GF	224,743
OG-1	66,039
OG-2	45,071
RE 1	7,929
RE-2a	197,204
RE-2b	26,437
RE-3	100,362
RM-1	7,632
RN-1	2,247
SI-1	70,491
SI-2	742
ST-1	147,469
ST-2	210,476
WI-1	841,034
WS-1	6,614
WS-2	3,074
WS-3	6,632

Purpose: This land allocation emphasizes unroaded motorized recreation opportunities, with 70 percent of the inventoried roadless area outside of the Alpine Lakes Management Area and the Entiat Experimental Forest allocated to unroaded management.

Rationale: This land allocation was developed with the cooperation of various off-road vehicle groups. It has a strong unroaded, motorized emphasis, while still remaining feasible.

Tradeoff: Present net value is reduced by 11.4 percent compared to the maximum PNV benchmark (Benchmark Run #7). Many factors which are not accounted for in the PNV calculation are significantly improved. Table II-3a in Chapter II of this FEIS presents a wide range of outputs and effects for this alternative and the maximum PNV benchmark. The differences between them are due to differences in land allocations and timber harvest constraint described below.

<u>FORPLAN Run</u>	<u>PNV (\$MM)</u>	<u>Discounted Costs (\$MM)</u>	<u>Discounted Benefits (\$MM)</u>	<u>1st Decade ASQ (MMCF/YR)</u>
Benchmark Run #7 (Maximum PNV)	2,132	266	2,398	29.9
Alternative G	1,889	371	2,260	17.5

8. Alternative H

This alternative was developed to portray the maximum timber producing capability of the Forest under the present land allocations of existing management direction. This alternative has about the same land allocations as Alternative A/NFMA.

a. The criteria and assumptions underlying the development of this alternative are:

- Achieve the common alternative constraints discussed earlier.
- Land allocation is defined by currently approved plans (Alpine Lakes Area Land Management Plan, the Chelan and Kittitas Unit Plans, and Ranger District Multiple Use Plans) except that all NFMA management requirements are met.
- Visual quality objectives reflect the current management of the Forest.
- Suitability for timber production is based on the latest study, not the currently approved Timber Management Plan.
- The Dispersed Recreation, Unroaded, Motorized (RE-2) Prescription was not split into trail bike versus 4-wheel-drive areas.
- The Classified Special Areas - Scenic/and or Recreation (SI-1) Prescription was applied to the portion of the Chelan Scenic Study Area which remains outside of wilderness.
- The public lands along segments of the following rivers are recommended for classification under the Wild and Scenic Rivers Act: American, Chiwawa, Cle Elum, Entiat, Icicle, Napeequa, Waptus, Wenatchee and White Rivers.
- The level of timber harvest specified in the current Timber Management Plans would be achieved if possible.

b. In addition to the common alternative constraints, the constraints utilized to meet the criteria and assumptions are:

(1)Constraint: Prescriptions were constrained to analysis areas to reflect the current land allocation, revised to meet all NFMA management requirements. The acreage by management prescription is shown below.

<u>Management Prescription</u>	<u>Acres</u>
Water	7,780
EF-1	4,770
EW-1	17,151
EW-2	52,301
GF	393,243
OG-1	66,823
OG-2	56,075
RE-1	4,494
RE-2	64,597
RE-3	59,551
RM-1	33,708
RN-1	1,717
SI-1	136,911
SI-2	382
ST-1	120,968
ST-2	286,733
WI-1	841,034
WS-1	12,423
WS-2	3,519
WS-3	23,426

Purpose: This allocation depicts the current management situation, revised to meet all NFMA minimum requirements.

Rationale: This allocation provides a legal and implementable version of current management.

Tradeoff: Present net value is reduced by 12.6 percent compared to the maximum PNV benchmark (Benchmark Run #7). Many factors which are not accounted for in the PNV calculation are significantly improved. Table II-3a in Chapter II of this FEIS presents a wide range of outputs and effects for this alternative and the maximum PNV benchmark. The differences between them are due to differences in land allocations and the timber harvest constraint discussed below.

<u>FORPLAN Run</u>	<u>PNV (\$MM)</u>	<u>Discounted Costs (\$MM)</u>	<u>Discounted Benefits (\$MM)</u>	<u>1st Decade ASQ (MMCF/YR)</u>
Benchmark Run #7 (Maximum PNV)	2,132	266	2,398	29.9
Alternative H	1,864	435	2,299	27.5

9. Alternative I

Alternative I is a departure from the base sale schedule established under Alternative C, the preferred alternative. It has the same land allocation as Alternative C. The timber harvest schedule for Alternative C is based upon nondeclining flow, never exceeding long-term sustained yield. Alternative I has the same long-term sustained yield capacity as Alternative C but deviates from nondeclining flow. The level of timber harvest in the first decade approximates the amount programmed for FY 1986 as determined by the current Timber Management Plans. The level of timber harvest gradually declines in the second and third decades, equaling that of Alternative C in the fourth decade. This would allow local industry to

phase into a lower level of timber harvest more gradually than in Alternative C. The impacts on other resources would be greater in the early decades due to the accelerated rate of timber harvest under the departure.

a. The criteria and assumptions underlying the development of this alternative are:

-Achieve the common alternative constraints discussed earlier.

-Resolve problems identified by the Forest Management Team with the current land allocation.

-Depart from the base sale schedule established for Alternative C such that it starts at the current timber harvest level and gradually drops to the level established for Alternative C.

-Segments of the American, Chiwawa, Cle Elum, Entiat, Icicle, Napeequa, Waptus, Wenatchee and White Rivers are recommended for classification under the Wild and Scenic Rivers Act.

-Expansion could take place at Chinook Pass, Mission Ridge, and White Pass ski areas.

b. In addition to the common alternative constraints, the constraints utilized to meet the criteria and assumptions are:

(1)Constraint: Prescriptions were constrained to analysis areas to resolve problems perceived with the current land allocation. The acreage by management prescription is shown below.

<u>Management Prescription</u>	<u>Acres</u>
Water	7,780
EF-1	4,770
EW-1	118,742
EW-2	47,361
EW-3	19,059
GF	389,089
OG-1	79,840
OG-2	49,015
RE 1	6,021
RE-2a	79,607
RE-2b	16,748
RE-3	116,092
RM-1	17,702
RN-1	2,247
SI-1	70,512
SI-2	2,798
ST-1	83,635
ST-2	174,880
WI-1	841,034
WS-1	5,554
WS-2	11,363
WS-3	23,426
MP-1	13,717

Purpose: This allocation reflects corrections of problems that the Forest Management Team perceived with the current land allocation. It resolves issues, concerns, and opportunities as perceived by the Forest Management Team.

Rationale: The Forest Management Team has a vast amount of on-the-ground experience on the Wenatchee. This land allocation captures their knowledge of the capability of the Forest to resolve issues, concerns, and opportunities.

Tradeoff: Present net value is reduced by 13.8 percent compared to the maximum PNV benchmark (Benchmark Run #7). Many factors which are not accounted for in the PNV calculation are significantly improved. Table II-3a in Chapter II of this FEIS presents a wide range of outputs and effects for this alternative and the maximum PNV benchmark. The differences between them are due to differences in land allocations and the three timber harvest constraints described below.

(2)**Constraint:** Timber harvest cannot fluctuate by more than 20 percent from decade-to-decade between decades 1 and 4, or by more than five percent from decade-to-decade between decades 4 and 15.

Purpose: To limit decade-to-decade fluctuations in timber harvest to amounts that could be absorbed by local mills.

Rationale: Versions of this alternative without this constraint had drastic fluctuations in timber harvest level between decades.

Tradeoff: This constraint and the two subsequent constraints were not analyzed separately. In combination, they result in a three percent increase in PNV compared to the nondeclining flow constraint which they replaced. These three constraints are the only differences between Alternatives C and I. A comparison of outputs and effects of these two alternatives reveals the full impact of these constraints.

(3) **Constraint:** First decade allowable sale quantity could not fall below 28.275 MMCF per year.

Purpose: To set first decade harvests at a level equal to the past 10 years average sell volume.

Rationale: To minimize impacts on local mills.

Tradeoff: This constraint was not analyzed separately. See the tradeoff discussion for Constraint (2).

(4)**Constraint:** Allowable sale quantity could not fall below 23.8 MMCF per year after the first decade.

Purpose: To maintain timber harvest levels at or above those of Alternative C.

Rationale: The intent of this alternative is to gradually phase into the harvest levels of Alternative C.

Tradeoff: This constraint was not analyzed separately. See the tradeoff discussion for Constraint (2).

<u>FORPLAN Run</u>	<u>PNV (\$MM)</u>	<u>Discounted Costs (\$MM)</u>	<u>Discounted Benefits (\$MM)</u>	<u>1st Decade ASQ (MMCF/YR)</u>
Benchmark Run #7 (Maximum PNV)	2,132	266	2,398	29.9
Alternative I	1,837	478	2,315	27.7

10. Alternative J

This alternative was developed by representatives of the timber industry after release of the Wenatchee DEIS. The goal of this alternative is to maintain harvest levels at their highest levels, while providing as much of the amenity outputs as possible without dropping ASQ below the level of the existing Timber Management Plan.

a. The criteria and assumptions underlying the development of this alternative are:

- Achieve the common alternative constraints discussed earlier.

- The highest acreage of General Forest land allocation of any of the alternatives with correspondingly lower roadless and scenic travel allocations.

- No scenic travel retention allocation outside of the Alpine Lakes Management Area. However, I-90 (Snoqualmie Pass), Highway 2 (Stevens Pass) and Highway 97 (Swauk Pass) are in the management unit.

- Limited partial retention allocations of Mather Memorial Parkway, Entiat River corridor, Lake Wenatchee and part of the Chiwawa River road.

- The deer and elk winter range allocation is managed under General Forest intensities, but with road closures and wildlife projects to benefit deer and elk.

- No rivers are recommended for classification under the Wild and Scenic Rivers Act

<u>FORPLAN Run</u>	<u>PNV (\$MM)</u>	<u>Discounted Costs (\$MM)</u>	<u>Discounted Benefits (\$MM)</u>	<u>1st Decade ASQ (MMCF/YR)</u>
Benchmark Run #7 (Maximum PNV)	2,132	266	2,398	29.9
Alternative J	1,835	452	2,277	34.1

11. Alternative NC (No Change):

This alternative is the No Change Alternative. This analysis was made and the information developed after the Forest Service held discussions with the Northwest Forest Resource Council, which had filed Appeal No. 1588 on May 19, 1986. Although the appeal was dismissed, the concerns addresses were important. The appeal centered on direction from the Regional Forester to incorporate management requirements (MR's) in the Current Direction Alternative for each Forest Plan. The Wenatchee National Forest published the Draft Environmental Impact Statement prior to the effective date of this direction and did not include MR's in the Current Direction Alternative. In response to the appeal, a No Change Alternative was developed to represent the existing Timber Management Plans. This alternative does not comply with all provisions of the National Forest Management Act of 1976 (NFMA) and regulations promulgated by the Secretary of Agriculture to implement NFMA. The following provisions of NFMA or other laws or regulations are not partially or fully complied with in current management plans represented by the No Change Alternative:

1. 36 CFR 219.14 - Timber resource land suitability: requires identification of land not suited for timber production based on risk of irreversible resource damage, lack of assurance of reforestation within five years.
2. 36 CFR 219.15 - Specifies a process for choosing vegetation management practices. Also ties to 36 CFR 219.27 which identifies required resource protection and silvicultural practices.
3. 36 CFR 219.16 - Required that all alternatives identify decadal timber harvest levels and long-term sustained yield levels, consistent with the requirements of the RPA program and Regional guide. Also specifies conditions under which departures from nondeclining flow will be considered.
4. 36 CFR 219.19 - Provides for viable populations of vertebrate wildlife species, the selection and monitoring of management indicator species, cooperation with wildlife management agencies, and protection of habitat critical to threatened or endangered species.
5. 36 CFR 219.20 - Requires that grazing resources be addressed, including identification of suitable lands, determination of range condition and trend, and the development of alternative range management prescriptions.
6. 36 CFR 219.21 - Requires to the degree consistent with needs and demands for all major resources, a broad spectrum of forest and rangeland related outdoor recreation opportunities shall be provided for in each alternative.
7. 36 CFR 219.23 - Requires full consideration of water and soil resources including estimates of current water uses, instream flow requirements, protection of water quality, watershed condition, and protection of wetland and floodplain values.
8. 36 CFR 219.25 - Requires that forest plans provide for the establishment of Research Natural Areas.
9. 36 CFR 219.26 - Provides for consideration of plant and animal community diversity.
10. 36 CFR 219.27 - Identifies specific management requirements to be used in the development, analysis, approval, implementation, monitoring, and evaluation of forest plans for management activities. These activities include silvicultural practices, resource protection, vegetative manipulation, protection of riparian areas, protection of soil and water, and maintenance of diversity.

11. 36 CFR 219.27(c) (7) (d) (1) - Requires that openings shall be located to achieve the desired combination of multiple use objectives. The blocks or strips cut shall be shaped and blended with the natural terrain, to the extent practicable, to achieve aesthetics, wildlife habitat, or other objectives established in the plan.

The No Change Alternative cannot be implemented or used in future management of the Forest under the Forest Plan without Congressional and/or Secretary of Agriculture action to change the law or regulation.

The timber management plans upon which the No Change Alternative is based were developed in 1963 and 1969. The Timber Management Plans were not integrated resource plans and, consequently, do not address all resource uses and outputs. The mission information in tables and figures presented in the supplement cannot be reasonably estimated since the original plans were based on yield tables and resource relationships which do not reflect the latest scientific techniques and information, do not reflect the standards in the NFMA regulations, or are otherwise inappropriate. Plan direction from the District Multiple Use Plans, and from other plans, was not reconciled with the timber management plans pending completion of the Forest Plan. Consequently, timber Potential Yield estimates used in the 1963 and 1969 Timber Management Plans and in the No Change Alternative may not be feasible under existing direction.

a. Key criteria and assumptions for this alternative provided by existing direction are listed below:

- Use a temporary inflation harvest schedule for the Naches-Tieton Working Circle. Yields are based upon the 1961 and 1968 inventories. Yield projection techniques are those that were used to develop the 1969 Timber Management Plan for the Naches-Tieton Working Circle and yield formulation methods for the Wenatchee Working Circle.

- Harvest 67.0 MMBF from the Naches-Tieton Working Circle and 103.8 MMBF from the Wenatchee Working Circle.

- Provide for 105,500 acres of Visual Management Areas in the Special Component.

- Provide for 102,200 acres of commercial forest land in the Marginal Component.

- Provide 787,751 acres of commercial forest land in the Standard and Special components from which timber will be harvested on a scheduled basis. The Wenatchee Working Circle has an additional 102,200 acres of marginal lands available for "unregulated" harvest if economics and operating methods are favorable.

VIII. ESTIMATING EFFECTS OF BENCHMARKS, DISCRETIONARY CONSTRAINTS, AND ALTERNATIVES

A. Introduction

This section provides a comprehensive description of each alternative and its associated outputs and effects. A comparative analysis of alternatives is the basis for evaluating alternatives and selecting a proposed action, planning steps 7 and 8. Present net value analysis is also described for major benchmarks.

The effects of discretionary constraints are summarized for each alternative. This discussion highlights the changes in present net value, discounted costs, and discounted benefits associated with these constraints, as well as nonpriced effects on net public benefit.

Alternative NC was not evaluated using FORPLAN. It is not possible to project outputs or to estimate effects in future decades for this alternative.

B. Process for Evaluating Significant Constraints

Management objectives of benchmarks and alternatives were modeled in FORPLAN by applying the assumptions and constraints listed in Sections VI and VII of this appendix. Opportunity costs of constraints were determined by comparing FORPLAN runs with a constraint and without it. Most discussion of opportunity costs focuses on changes in present net value. Changes in other outputs and effects (e.g., timber volume or old-growth habitat) can also be considered.

Legal and policy constraints and economic assumptions are analyzed in Section VI of this appendix. Opportunity costs of constraints associated with meeting resource objectives are analyzed in Section VII under each alternative.

C. Major Tradeoffs Among Alternatives

This section summarizes the relationships among economic values, community effects and the differing responses among alternatives to selected issues, concerns, and opportunities (ICO's). The purpose is to highlight major economic and noneconomic tradeoffs, or differences between alternatives, that can be quantified as indicators of response to ICO's among alternatives. However, a complete understanding of differences among alternatives requires reading Chapters II and IV of the FEIS. Appendix A discusses the ICO's in greater detail.

Tradeoffs between Alternative NC and other alternatives are evaluated for only the first decade. Trade-off analysis in future decades is not possible because Alternative NC cannot be projected into future decades.

1. ECONOMIC VALUES AND RESPONSES TO MAJOR ISSUES, CONCERNS, AND RESOURCE USE AND DEVELOPMENT OPPORTUNITIES

The major reason that alternatives differ is that each responds in different ways to the issues, concerns, and resource use and development opportunities (ICO's) identified for this Forest. This section summarizes many of these differences in responses by defining indicators of those responses that can be quantified. It also discusses indicators of central concern to the nation as a whole, as owner of this Forest. Appendix A fully discusses each of the ICO's. A less quantified comparison of the responsiveness of the alternatives is found in Table II-1 in FEIS Chapter II. The ICO's and indicators of responsiveness found in Table B-VIII-1 include:

- Recreation opportunities and use conflicts
 - Indicator: - percent of Forest by recreation opportunity spectrum (ROS) class at the start of the second decade
- Management of areas that are presently undeveloped
 - Indicator: - allocation of inventoried roadless areas to roaded versus unroaded management
- Water quality and quantity
 - Indicators: - first decade increased water yield
 - average annual sedimentation over the planning horizon
- Wildlife and fish
 - Indicators: - acres allocated to Key Big Game Habitat Management Area
 - acres of old-growth retained (fifth decade)
 - commercial harvest of anadromous fish
- Management of scenery
 - Indicator: - percent of Forest by visual quality objective (VQO).
- Timber Management
 - Indicators: - first decade average annual harvest (Programmed Timber Sales MMCF)
 - long-term sustained yield capacity
 - acres of suitable timber lands
- Minerals
 - Indicators: - lands that are withdrawn and relatively unrestricted by management prescriptions in terms of total forest area.
- Social/Economic
 - Indicators: - first decade payments to counties
 - first decade change in employment
 - first decade change in income

In addition, the nation as a whole has an interest in ensuring that the Forest is managed in a financially prudent manner while the quality of the physical environment is protected and enhanced. Indicators of national interest include:

- Present net value
- First and fifth decade net receipts (cash flows)
- First and fifth decade noncash benefits

TABLE B-VIII-1

**INDICATORS OF RESPONSIVENESS OF ALTERNATIVES
TO MAJOR ISSUES AND NATIONAL CONCERNS**

INDICATORS OF RESPONSIVENESS	ALTERNATIVES 1/										
	A/NFMA	D	C	F	G	H	I	E	J	B	NC
Present Net Value (million \$)	1976	1937	1910	1897	1889	1864	1837	1834	1825	1756	1/

1/ Alternatives are ranked in order of decreasing present net value (except for NC which does not have a PNV computed) All resource outputs cannot be reasonably estimated for Alternative NC because the TM plans were based on different yield tables and resource relationships.

2/ Alternative J has different standards and guidelines for key wildlife habitat areas and Retention/Partial Retention areas than the other alternatives Refer to Appendix D for more information.

3/ Alternative NC includes a 2.6 MMCF temporary inflation of the cut

2. DIFFERENCES AND SIMILARITIES OF INDIVIDUAL ALTERNATIVES

The alternatives are ranked in order of decreasing present net value (PNV) in Table B-VIII-1. They are discussed below in the same order.

a. ALTERNATIVE A/NFMA

Alternative A/NFMA is the No-Action Alternative. It is implementable as it now provides for the management requirements mandated by the National Forest Management Act of 1976 (NFMA).

Alternative A/NFMA has the highest present net value of the alternatives. One major contributor to the high PNV for this alternative is the low recreation budget, while recreation benefits remain high. Alternative A/NFMA has the highest net receipts (though still negative) of all the alternatives for the first decade. By the fifth decade, Alternative A/NFMA slips to third in net receipts because the intensive timber management practices in Alternatives B and J increase receipts over Alternative A/NFMA. It has non-cash benefits at a level slightly higher than the other alternatives.

Alternatives A/NFMA and H allocate the fewest acres of the inventoried roadless areas to unroaded management with the exception of Alternatives B, D, J, and the No-Change Alternative. Of those areas remaining roadless, a greater proportion is assigned to motorized use than most alternatives. By the end of the second decade, only Alternatives G and H have a greater percentage in the Semi-Primitive Motorized Recreation Opportunity Spectrum class.

With the exception of Alternative NC, alternative A/NFMA has the fourth lowest level of water yield and the fifth lowest level of sedimentation. Both factors are closely correlated to timber harvest levels, although they are also influenced by the location and type of harvest. The sedimentation level is higher than would be expected based on harvest level alone.

Alternatives A/NFMA and H have the fewest acres allocated to management for key big game species than other alternatives. Alternative A/NFMA, by the fifth decade, has greater amounts of old-growth remaining than any other alternatives, except for Alternatives E and F. Anadromous fish production is the same for all alternatives in the first decade.

Alternatives A/NFMA and H result in 17.5 percent of the Forest ending in a modified visual environment over the 50-year planning horizon. This is near the middle of the range of alternatives as five alternatives modify the visual environment more with three alternatives modifying it less. The modification of the visual environment is directly proportional to the volume of timber harvest and its rate.

Alternative A/NFMA has the eighth highest timber harvest in the first decade with the sixth highest long-term sustained yield. It has the sixth highest acreage of suitable timberlands. The objective function in FORPLAN is to maximize present net value.

Alternatives A/NFMA and NC are fourth highest in acres open to mineral resources with only moderate to few constraints.

Alternative A/NFMA has the eighth highest level of jobs and income change from the 1982 base period. The change in jobs and income is directly related to the timber harvest level. The higher the timber harvest, the greater the gain in jobs and local income. Alternative A/NFMA has the sixth highest level of payments to counties. The payment to counties is somewhat related to the level of timber harvest. In general, there is a direct correlation, but for Alternatives B and J the payment to counties level is lower because these alternatives harvest less valuable timber in the early decades. For the later decades, the payment to counties increases for these alternatives.

b. ALTERNATIVE D

Alternative D has the second highest present net value of the alternatives. This is due to the high acreage allocated to some sort of timber management coupled with the use of the maximize present net value objective function in FORPLAN. Alternative D has the second highest net receipts of all the alternatives for the first decade. By the fifth decade, Alternative D is fourth in net receipts.

Alternatives D and B have the third lowest allocation of the inventoried roadless areas to unroaded management. Only Alternatives J and NC have less roadless areas allocated to unroaded management.

Alternative D has the sixth highest level of increased water yield and eighth highest level of sedimentation of the alternatives. This is closely correlated with timber harvest level. Alternative D also has the sixth highest level of timber harvest.

Alternatives D and B have the third fewest acres allocated to key big game species. By the fifth decade Alternative D has the fourth fewest acres of old-growth remaining. Anadromous fish production is the same as other alternatives.

Alternatives D and B result in 32.6 percent of the Forest ending in a modified visual environment over the 50-year planning horizon. Only Alternatives J and NC end up with a more modified visual environment. Alternative D has the sixth highest timber harvest, but the third highest long-term sustained yield. It has the fourth highest suitable timberland base.

Alternatives D and B are second highest in acres open to mineral resources with only moderate to few constraints.

Alternative D has the sixth highest level of jobs and local income of the alternatives and the third highest level of payment to counties.

c. ALTERNATIVE C - Preferred

Alternative C has the third highest present net value of any alternative. Alternative A, which has the highest present net value, is 3.5 percent higher. Alternative C was constrained in FORPLAN to produce an allowable sale quantity of 136 MMBF. This resulted in a reduction of about one percent from the maximum PNV level for this alternative. Alternative C, however, maximizes net public benefits and was, therefore, selected as the preferred alternative.

For the first decade, Alternative C has the fifth highest level of net receipts. By the fifth decade, this ranking would likely slip to sixth highest level of net receipts. It has non-cash benefits at a slightly higher level than most of the other alternatives, but the difference is not significant.

Alternatives C and I allocate the fourth highest acreage of the inventoried roadless areas to roadless management. Alternative I, which is the departure alternative, has the same land allocations. Only Alternatives E, F, and G have greater allocations to unroaded management. Roadless areas allocated to roaded management would be developed faster under Alternative I than under Alternative C.

Alternative C has the seventh highest water yield and the fifth highest rate of sedimentation.

Alternatives C and I have the fifth highest acreage allocated to key big-game species. At the end of the fifth decade, Alternatives C and I will have the third highest level of old-growth remaining. At this point, there should be 261,200 acres of old growth remaining. Anadromous fish production is the same as other alternatives.

Under Alternatives C and I, 21.5 percent of the forest ends up in a modified visual environment over the 50-year planning horizon. In the range of alternatives, this is the fifth highest.

To maximize net public benefits, the allowable sale quantity for Alternative C was set at 136 MMBF. This is the seventh highest timber harvest level. It also has the seventh highest long-term sustain yield level and suitable timberland base.

Alternatives C and I have 38.8 percent of the land base open to mineral resources with only moderate to few constraints.

Alternative C has the seventh highest level of job increase and income. This alternative has the fourth highest level of payment to counties.

d. ALTERNATIVE F

Alternative F has the fourth highest present net value. It has a large portion of the inventoried roadless areas allocated to roadless management. This reduces the level of timber harvest, which reduces PNV. Most of the benefits of not roading these areas are unquantified and must be subjectively weighed to determine the net public benefits of the alternative.

Alternative F has the fourth highest net receipts in the first decade, dropping to the sixth highest net receipts by the end of the fifth decade. The non-cash benefits to users are slightly lower than the other alternatives, but the differences are not significant.

Alternative F allocates the second highest acres of the inventoried roadless areas to unroaded management. Only Alternative E has a greater allocation to unroaded management.

Alternative F has the next to lowest water yield of any alternative. It also has the next to lowest amount of sedimentation. Both factors are closely correlated to timber harvest levels.

Alternatives F and E have the highest acre allocation to management for key big-game species with. Alternative F maintains the second highest level of old-growth, only slightly lower than Alternative E. Anadromous fish production is the same as other alternatives.

Alternative F would have the second most natural appearing landscape of the alternatives. Only Alternative E would have a more natural appearing landscape.

Alternative F has the next to lowest level of timber production both in the first decade and long-term. It has the second fewest acres of suitable timberlands.

Alternative F has the second fewest acres available for relatively unconstrained mineral related activities

Alternative F has the next to lowest level of jobs and income of the alternatives. The job change is -473 jobs and the income change is -13.3 million dollars. The payment to counties level is the ninth highest at 2.0 million dollars.

e. ALTERNATIVE G

Alternative G has the fifth highest present net value. It has the sixth highest net receipts for the first decade; by the fifth decade the net receipts drop to the seventh highest. The non-cash benefits are slightly higher than the other alternatives for the first decade. By the fifth decade, this alternative drops to second highest in non-cash benefits. However, the differences are not significantly different between the various alternatives.

Alternative G has the third highest allocation of inventoried roadless areas to unroaded management. Only Alternatives E and F have more roadless areas allocated to roadless management. This alternative has the greatest amount of roadless area available for the trail bike use.

Alternative G has the ninth highest water yield sediment produced. These correspond fairly closely to the level of timber harvest.

Alternative G has the third highest allocation to key big-game species. It is only a couple of thousand acres below the maximum for Alternatives E and F. The old-growth acreage at the end of the fifth decade is the eighth highest of the alternatives. Anadromous fish production is the same as other alternatives.

Alternative G results in 14.5 percent of the Forest ending in a modified visual environment over the 50-year planning horizon. Only Alternatives E and F have less acreage in a modified visual environment. This is because the modification of the visual environment is directly proportional to the volume of timber harvest and its rate.

Alternative G has the third lowest level of timber harvest and long-term sustain yield level. The suitable timberland base is also the third lowest of the alternatives.

Alternative G has the third lowest level of land open to mineral development with 36.3 percent of the land with only moderate to few constraints.

Alternative G has a net change of -225 jobs and -6.54 million dollars. The payment to counties level is 2.5 million dollars--the seventh highest level of the alternatives.

f. ALTERNATIVE H

Alternative H has the sixth highest present net value of the alternatives. This alternative has the same allocations as Alternative A/NFMA, except for the Wild and Scenic River recommendations which match Alternative C recommendations with private land removed from the recommended segments. Alternative A/NFMA produces a level of timber harvest that maximizes present net value, while Alternative H produces a level of timber harvest that maximizes first decade timber harvest subject to non-declining flow. Alternative H produces 24 percent more timber than Alternative A/NFMA in an attempt to meet historic levels of timber harvest. This results in a decrease in total present net value of 5.5 percent.

Alternative H has the fifth lowest net receipts for the first decade, dropping to the third lowest net receipts by the fifth decade. The level of non-cash benefits to users is similar to the other alternatives.

Only Alternatives NC, B, D and J have fewer acres of inventoried roadless area allocated to unroaded management. Alternative A has the same roadless allocation as Alternative H; the roadless areas, however, would be entered at a faster rate in Alternative H.

Alternative H would have the fourth highest increased water yield and sedimentation. Alternatives NC, B and J are the alternatives that would be higher.

Alternative H has the second fewest acres allocated to key big-game species of the alternatives. At the end of five decades, Alternative H does have the sixth highest level of old-growth remaining. Anadromous fish production is the same for all alternatives in the first decade.

Alternative H results in 17.5 percent of the Forest ending in a modified visual environment over the 50-year planning horizon. This is in the middle of the range of alternatives. The modification of the visual environment is directly proportional to the volume of timber harvest and its rate. For this reason, modification of the visual environment would occur at a faster rate under Alternative H than Alternative A/NFMA.

Alternative H has the fifth highest harvest level in the first decade, and the fifth highest long-term sustain yield level. It also has the fifth highest acreage of suitable timberlands. The objective function in FORPLAN is to maximize first decade timber harvest subject to non-declining flow.

Alternative H is the sixth highest in acres open to mineral resources with only moderate to few constraints.

Alternative H has the fifth highest level of job increase, the sixth highest level of income increase, as well as the fifth highest level of payments to counties.

g. ALTERNATIVE I

Alternative I ranks seventh in present net value. This alternative has the same allocations as Alternative C. This is a departure alternative where higher timber harvest occur during the first two decades. The harvest level then starts declining in the third decade. For the first decade, Alternative I has the eighth highest net receipts, declining to the lowest net receipts by the end of the fifth decade. This is the result of having higher harvest levels for the first two decades. Alternative I has the same roadless allocations as Alternative C. This is the fourth largest level for the alternatives with 53.6 percent of the inventoried roadless areas remaining roadless. Only Alternatives E, F, and G have greater allocations to unroaded management. Rooding of the

roadless areas proceeds faster in Alternative I than in most of the other alternatives because of the higher levels of timber harvest in the first two decades.

Alternative I has the fifth highest water yield and the sixth highest sedimentation rate.

Only Alternatives E, F, G and J have greater allocations for management of key big-game species. Alternative I maintains the fourth highest level of old-growth at the end of the fifth decade. The level of anadromous fish production is the same as the other alternatives.

Under Alternative I, 21.5 percent of the Forest ends up in a modified visual environment over the 50-year planning horizon. In the range of alternatives this is the fifth highest.

Alternative I has the fourth highest harvest level of the Alternatives. The long-term sustained yield is only the eighth highest of the alternatives. This alternative has the seventh highest suitable timberland base.

The allowable sale quantity for Alternative I is a departure from the base sale schedule established for Alternative C. It equals the average timber volume sold between Fiscal Year 1975 and Fiscal Year 1984 gradually declining to the same level as Alternative C.

Alternative I has 38.8 percent of the land base open to mineral resources with only moderate to few constraints.

Alternative I has the third highest job and fourth highest income change from the 1982 base period. This alternative had the second highest payment to counties level of the alternatives.

h. ALTERNATIVE E

Alternative E has the third lowest present net value of the alternatives. It has the greatest allocation of unroaded management and the lowest level of timber production. This results in a greater proportion of its benefits being subjective contributions to net public benefits rather than being quantified as part of present net value.

Alternative E has the third lowest net receipts in the first decade dropping to the next to the lowest net receipts in the fifth decade. The non-cash benefits to users are comparable to the other alternatives in the first decade and slightly higher than the other alternatives in the fifth decade. The differences, however, are not significant.

All the inventoried roadless areas outside the Alpine Lakes Management Area are allocated to unroaded management (90 percent Forest-wide). This is the most of any alternative.

Alternative E has the least amount of increase in water yield of the alternatives. It also has the least amount of sedimentation and the highest water quality.

Alternatives E and F have the highest acre allocation to management for key big game species. Alternative E maintains the highest level of old-growth of all the alternatives. Anadromous fish production is the same as other alternatives

Alternative E would have the most natural appearing landscape of any alternative. Only 11.4 percent of the Forest would be managed under the visual quality objective of modification or maximum modification.

Alternative E has the lowest level of timber harvest both in the first decade and the lowest long-term sustained yield level. It has the fewest acres of suitable timberlands.

Alternative E has the fewest acres available for mineral-related activities. For the alternative, 30.8 percent of the land is open to mineral activities with only moderate to few constraints.

Alternative E shows the lowest level of jobs and income of all the alternatives. This alternative shows a change of -520 jobs and -14.56 million dollars. Alternative E also has the lowest payment to counties level at 1.9 million dollars.

i. ALTERNATIVE J

Alternative J has the next to the lowest present net value of all the alternatives. This is a result of heavy timber investments in the early decades which significantly reduced present net value for this alternative. Alternative J has the next to the lowest net receipts for the first decade. By the fifth decade, however, the early timber investments raise the net receipts to the second highest.

Alternative J allocates the second fewest acres of the inventoried roadless areas to roadless management. Of the inventoried roadless areas, 37.6 percent would remain roadless under this alternative.

Alternative J has the highest increased water yield and the highest sedimentation rate of the alternatives. This is closely correlated with timber harvest level. Alternative J has the highest timber harvest level of the alternatives.

Alternative J has the fourth highest allocation to key big-game species. The prescription for key big-game species is slightly different than the other alternatives in its treatment of thermal cover. The yield tables used in Alternative J are the same as that for general forest prescription, but it has road closures and other management activities to protect and enhance key big-game species habitat. By the fifth decade, Alternative J has the lowest acreage of old-growth remaining. Anadromous fish production is the same as other alternatives.

Alternative J results in 34.0 percent of the Forest ending in a modified visual environment over the 50-year planning horizon. This is the second highest level of the alternatives. It uses different standards and guidelines for visual treatment along roads and visual corridors. These guides do not correspond to the ST-1 or ST-2 prescriptions. See Appendix D.

Alternative J has the highest first decade harvest level, the highest long-term sustained yield, and the second highest acreage in suitable timberlands.

Alternative J has the largest amount of acreage open to mineral resources with only moderate to few constraints.

Alternative J has the highest gain in jobs and income of the alternatives. This is because this alternative has the highest timber harvest level. Alternative J has the eighth highest level of payment to counties.

j. ALTERNATIVE B

Alternative B has the lowest level of present net value of any alternative. It has the same land allocations as Alternative D, which has the second highest PNV of the alternatives. Alternative D produced the quantity of timber which achieved the highest level of PNV, subject to meeting other resource considerations. Alternative B produces 31 percent more timber than Alternative D, while still meeting other resource constraints. The costs of producing the additional timber exceed the benefits. This results in a PNV nine percent below the level of Alternative D.

Alternative B has the lowest net receipts in the first decade due to the high level of timber investments in the early decades. However, this investment results in Alternative B having the highest net receipts of all alternatives by the fifth decade.

Alternative B has the third lowest acres of inventoried roadless area allocated to unroaded management. Rooding of the areas allocated to rooded management would occur the fastest in this alternative and Alternative J.

Alternative B has the second highest level of increase water yield and third highest level of sedimentation of any alternative. This is a result of the level of timber harvest.

Alternative B has the seventh highest level of acreage allocated to management for key big-game species. Alternative B will have the second lowest level of old growth remaining by the fifth decade. Anadromous fish production is the same as for the other alternatives.

Alternative B would have the third least natural appearing landscape by the fifth decade. At that time, 32.6 percent of the landscape will appear modified. Alternative B would alter the landscape at the second fastest rate.

Alternative B harvests the second highest level of timber of the alternatives. It also has the second highest long-term sustained yield capacity and the third highest acres of suitable timberland. In Alternative D, which has a maximize present net value objective function and the same land allocations as Alternative B, not all the timber is harvested on land available for timber harvest. Some acres are not utilized because they are not economically efficient. Alternative B, however, harvests timber on lands that were not utilized in Alternative D. Alternative B also utilizes more intensive management with more precommercial and commercial thinning.

Alternative B has 43.3 percent of the land area open to mineral activities with only moderate to few constraints.

Alternative B is second to Alternative J in change of jobs and income increasing by 577 jobs and 15.31 million dollars. This alternative has the third lowest payment to counties level at 2.0 million dollars.

k. NO CHANGE (NC)

The No Change Alternative does not have a PNV computed. A comparison of resource outputs is not made for Alternative NC because the Timber Management plans were based on different yield tables and resource relationships.

3. PRESENT NET VALUE AND DISCOUNTED COSTS AND BENEFITS OF ALTERNATIVES

Table B-VIII-2 displays Present Net Value (PNV) and total discounted costs and benefits for the alternatives. PNV is the primary measure of economic efficiency used by the Forest Service. It is the sum of the priced benefits minus the sum of costs for the next 50 years, discounted to the present the present at the rate of four percent per year. An additional sensitivity analysis has been completed using a discount rate of 7-1/8 percent per year. Results of this analysis is shown in Appendix B.

The alternatives are ranked by decreasing present net value. Table B-VIII-3 displays the differences in PNV between adjacent pairs of successional ranked alternatives. The incremental changes in PNV are a measurement of the net economic values of the priced resources that would be foregone if a lower-ranked alternative is selected over a preceding one. This must be weighed against the nonpriced benefits of the alternatives.

TABLE B-VIII-2

**Present Net Value and Discounted Costs
and Benefits of Alternatives
(Million Dollars)**

Alternative	PNV Benchmark	Change	Discounted Costs	Change	Discounted Benefits	Change
Max PNV	2,132		266		2,318	
(Current Mgt)		-156		+63		-13
A/NFMA	1,976		329		2,305	
D	1,937	-39	410	+81	2,347	+42
C (Preferred)	1,910	-27	409	-1	2,319	-28
F	1,897	-13	312	-97	2,209	-110
G	1,889	-8	371	+59	2,260	+51
H	1,864	-25	435	+64	2,299	+90
I (Departure)	1,837	-27	478	+43	2,315	+16
E	1,834	-3	368	-110	2,202	-113
J	1,825	-9	452	+84	2,277	+75
B	1,756	-69	503	+51	2,259	-18
NC	<u>1/</u>		<u>1/</u>		<u>1/</u>	

1/ Resource outputs cannot be reasonably estimated because the TM plans were based on different yield tables and resource relationships for this reason PNV was not computed for the NC Alternative.

Alternative A/NFMA has the highest PNV at \$1,976 million. Alternative B has the lowest PNV at \$1,756 million. Alternatives A/NFMA, D, G, F, and E had a maximize PNV objective function in FORPLAN. Alternatives C, H, I, J, and B had either a timber volume target or were run under a maximize timber volume objective function in FORPLAN.

For the alternatives run under a maximize PNV objective function in FORPLAN, the greater the acreage allowing timber harvest the higher the PNV. The one exception is Alternative A/NFMA, which had a higher PNV because its recreation costs were significantly lower than for the (89 budget) other alternatives. The recreation benefits for Alternative A were similar to the other alternatives.

The present net values for Alternatives C, H, I, J, and B were directly related to the volume of timber produced in excess of the amounts that would maximize PNV for those alternatives' land allocations. That is, the value of the increased timber production in these alternatives is offset by less efficient production of timber.

Discounted costs equal the sum of all costs which would be incurred for an alternative during the 50 year planning horizon, discounted to their present values using a 4 percent discount rate. Alternative B has the highest discounted cost at \$503 million due to higher timber costs. As a general rule, costs were highest for those alternatives that produced the largest amounts of timber.

Discounted benefits equal the sum of all benefits which would be accrued for an alternative during the 50 year planning horizon, discounted to their present values using a 4 percent discount rate. Alternative D has the highest discounted benefits at \$2,347 million. Alternative F had the lowest discounted benefits at \$2,187 million. Alternative D has the highest benefits because of its economically efficient timber harvest levels.

4. DISCOUNTED COSTS AND BENEFITS BY RESOURCE GROUP

Table B-VIII-3 presents a more detailed breakdown of benefits and costs by resource groups. The alternatives are ranked in order of decreasing present net value. This display is only intended to give a broad indication of resource relationships. Many costs are nonseparable under multiple use management. It is difficult to attribute these costs to specific resources.

Resources having priced outputs are aggregated into groups for display in Table B-VIII-3. Timber refers to sawtimber. Recreation includes developed and dispersed recreation other than wildlife and fish related recreation. Wildlife and fish includes wildlife and fish related recreation and commercially harvested anadromous fish. Range refers to permitted grazing. "Other" includes water yield.

Arterial and collector roads are shown as a separate costs item rather than being attributed to specific resources. Costs that were not clearly associated with a specific resource are included under "other."

TABLE B-VIII-3
Present Net Value and Discounted Benefits
and Costs by Resource Group 1/
(Million Dollars)

<u>Alt</u>	<u>Present Net Value</u>	<u>Discounted Benefits</u>					<u>Discounted Costs</u>					
		<u>Rec.</u>	<u>Wild.</u>	<u>Tbr.</u>	<u>Range</u>	<u>Other</u>	<u>Rec.</u>	<u>Wild.</u>	<u>Tbr.</u>	<u>Roads</u>	<u>Range</u>	<u>Other</u>
A/NFMA	1,976	1,344	681	274	4	2	56	55	146	42	5	25
D	1,937	1,346	674	321	4	2	126	45	162	43	9	25

1/ Direct comparisons of benefits and costs by individual resource provide broad indications of relationships, but they may be misleading because many costs are nonseparable under multiple use management.

2/ Resource outputs cannot be reasonably estimated because the TM plans were based on different yield tables and resource relationships for this reason PNV was not computed for the NC Alternative.

Table B-VIII-3 reveals that almost all of the differences in present net value, discounted costs, and discounted benefits between alternatives is due to variations in the timber resource and changes in costs for the recreation and wildlife programs. The alternatives represent a wide range of timber harvest levels ranging from 81.6 MMBF to 186.6 MMBF for the first decade. With the exception of the departure alternative, discounted costs for timber rank in the same order as the timber harvest levels of the alternatives.

Present Net Value patterns are determined by whether the objective function in FORPLAN was maximize PNV or maximize timber volume objective or a timber volume target. Alternatives A/NFMA, D, E, F, and G had a maximize PNV objective function in FORPLAN. Alternatives B, C, H, I, and J had either a timber volume target or were run under a maximize timber volume objective function in FORPLAN. Alternative B was run under a maximize timber volume objective function to attempt to meet the RPA timber target assigned to the Forest by the Regional Guide for the Pacific Northwest Region. Alternative C had a 136 MMBF first decade target volume to meet local community needs. Timber harvest for Alternative H was set at the level which maximized timber production under the current land allocation in order to come as close as possible to the harvest level set by the Forest's current timber management plan. Alternative I is a departure alternative in which the first decade timber harvest is constrained to equal the average volume sold on the Forest from fiscal year 1975 to fiscal year 1984. Alternative J was run under a maximize timber volume objective function to reach a harvest level as close to 180 MMBF as possible. For all these alternatives, the timber volume level exceeds the PNV level. This results in higher harvest volume, but increases the ratio of costs to benefits. It is for this reason that the PNV's are lower for these alternatives.

Recreation benefits do not vary significantly between alternatives. All alternatives supply enough recreation capacity to exceed projected demand during the 50-year planning horizon. A shortage of unroaded recreation is projected for some alternatives beyond the planning horizon. The quality of the recreation experience would vary between alternatives even though the PNV benefits show little change. This effect was beyond the Forest's ability to quantify into dollar values and is considered as a nonpriced contribution to net public benefits. Recreation costs vary with the objectives of the alternative.

Wildlife and fish benefits vary slightly among alternatives due to different levels of investment in habitat improvements. The bulk of fish and wildlife benefits are recreation oriented and most of this recreation activity would occur regardless of the levels of investment in habitat improvement. The wildlife costs vary significantly by alternative. These costs are related to the goals and objectives for the alternative.

Range benefits and costs vary between alternatives, the differences between alternatives is small enough that it doesn't show up in Exhibit 2 where values are rounded to the nearest million dollars. For all alternatives, the cost of the range program exceeds the benefits.

5. NET CASH FLOWS OF ALTERNATIVES

Table B-VIII-4 compares the expected cash flows to and from the United States Treasury that would be associated with the alternatives. Receipts are fees collected for sawtimber, firewood, grazing, developed camping, recreation and other special uses, and mineral leases. Costs include only Forest Service budgetary costs. Net receipts equal total receipts less total costs. Non-cash benefits to the user are the difference between priced benefits and receipts actually collected for goods and services.

Alternatives are ranked by decreasing net receipts in Table B-VIII-4. All alternatives have negative net receipts for the first and fifth decade. This indicates negative net cash flows to the United States Treasury. Net receipts range from -10.5 million dollars for Alternative A to -26.1 million dollars for Alternative B for the first decade. Net receipts improved significantly by the fifth decade, but were still negative. Alternative B net cash flow improved to -1.4 million dollars, while Alternative I had the worst cash flow at -14.2 million dollars.

The reason for the negative cash flow is that both recreation and wildlife programs produced substantial benefits for which no revenue was collected for the Federal Government. For recreation, the only receipts are generated from campground fees and recreation special uses, all other users do not pay fees to the Federal Government. Likewise, the wildlife program produces substantial benefits for which no fees are collected. As Table B-VIII-4 indicates, non-cash benefits to users total approximately 81 million dollars for the first decade and 115 million dollars for the fifth decade. For the timber program, the variation in receipts is due to the differences in the volume, species mix, and size of timber harvested. The variation in costs is due to differences in the volume, location, and silvicultural system of timber harvested. In the first decade, all alternatives except B and J produced positive net receipts. By the fifth decade, the timber program was producing positive net receipts for all alternatives. The alternatives with the largest net cash receipts in the fifth decade were Alternatives B and J as a result of the large investments in the timber program in the first decade.

Total receipts are higher for the fifth decade than for the first decade. The general trend is for the alternatives to harvest more valuable timber in the future due to the assumption that timber will increase in real value by one percent a year for the next 50 years. Costs tend to be stable to somewhat lower in the future, primarily due to lower capital investments for roads. Non-cash benefits also increase due to increased recreational use, grazing, and wildlife and anadromous fish production.

Receipts plus non-cash benefits exceed costs in all alternatives for all decades.

TABLE B-VIII-4

**AVERAGE ANNUAL CASH FLOWS AND NON-CASH BENEFITS IN THE
FIRST AND FIFTH DECADES 1/
(Million Dollars)**

ALT.	Decade 1				Decade 5			
	Net Receipts	Total Costs	Total Receipts	Non-Cash Benefits to Users	Net Receipts	Total Costs	Total Receipts	Non-Cash Benefits to Users
A	-10.5	23.0	12.5	81.3	-6.2	20.6	14.4	115.4

B	-26.1	34.2	8.1	81.2	-1.4	27.5	26.1	114.2
NC	-2.4	17.6	15.2	2.7	<u>2/</u>	<u>2/</u>	<u>2/</u>	<u>2/</u>

1/Costs include only those of the Forest Service; receipts do not include payments to counties.

2/Resource outputs cannot be reasonably estimated because the TM plans were based on different yield tables and resource relationships.

For a display of quantifiable changes in outputs and effects for each alternative, refer to Table II-3a in Chapter II of the FEIS. See Table II-3b in Chapter II of the FEIS for a display of changes in outputs and effects which are more difficult to quantify.

D. Allowable Sale Quantity by Proclaimed National Forest

Section 13(a) of the National Forest Management Act of 1976 requires the calculation of sustained yield on individual proclaimed National Forests. The Naches Ranger District is administered by the Wenatchee National Forest, but is within the proclaimed boundary of the Snoqualmie National Forest. Proclaimed Wenatchee National Forest land administered by the Mt. Baker-Snoqualmie Forest includes 3,751 acres near Snoqualmie Pass. The Okanogan National Forest administers 9,032 acres of the Wenatchee proclaimed area.

The administering Forest is the primary planning area in FORPLAN. However, the model was rerun to find the proportion of predicted outputs for each Ranger District. Table B-VIII-5 shows the results of the calculations of the harvest levels and suitable lands for the Naches Ranger District. The minor administrative changes on other lands were ignored in this calculation.

TABLE B-VIII-5

Proclaimed and Administering National Forest
Allowable Sale Quantity for Alternative C (First Decade)

Proclaimed Forest	Administering Forest	Long-Term Suitable Acres	Allowable Sale Sustained Yield MMCF/YEAR	Quantity MMCF/YEAR

note: Wilderness areas identified

APPENDIX C

ROADLESS AREAS

INTRODUCTION

The purpose of this Appendix is to present a detailed and site-specific analysis of the areas of the Wenatchee National Forest that are in an Unroaded and essentially undeveloped condition. It includes a description of the resources, physiographic and biologic features, and the present management situation for each area. In addition, it specifically indicates how each area would be affected by the alternatives proposed in this FEIS.

With the passage of the Washington State Wilderness Act of 1984, Congress found that the Forest Service was *not required to review the wilderness option for the remaining Roadless Area Review and Evaluation (RARE II) areas, areas less than 5,000 acres in size, certain areas evaluated for wilderness in unit plans, and Further Planning Areas in Washington when developing this Forest Plan.* This law does provide that the areas that are still in an unroaded condition when this plan is revised shall be reviewed with wilderness as an option. The full text of this portion of the Act is: Sec. 5 (a) (1 & 2), (b) (1 & 2), and (d).

Since Congress has not designated these areas as wilderness, this appendix does not make a recommendation on wilderness option for the unroaded areas. Congress has done that job.

This appendix does present information about the unroaded areas to disclose the environmental effects of allocation each area to continued unroaded status or to some level of development (of all or a portion) of each area.

To do this, this appendix presents a description of the environment, presents the proposed management allocation for each of the alternatives, and discloses the environmental consequences of those alternatives for each area.

If roads, timber harvest, or other development occurs in these areas, they will no longer be eligible for consideration for wilderness. This itself may be a significant environmental consequence. For this reason we are considering each area's attributes as a wilderness, such as its capability, availability, and need, so that any decision to designate the area for particular uses will be made with full knowledge of its environmental consequences.

General

The areas being addressed in this Appendix were included in an updated inventory of roadless areas made by the Wenatchee National Forest in the fall of 1983. The inventory considered roadless areas involved in RARE I and II, Unit Planning and other areas not included in any of those assessments.

All of the areas discussed in detail in this Appendix are those remaining after passage of the Washington State Wilderness Act of 1984.

In April of 1985 the areas were re-examined by the Wenatchee National Forest and boundary adjustments were made to account for any development activities which occurred after the Act. In November of 1988 the areas were again re-examined and small boundary adjustments were made. Changes in land allocations have been made between the DEIS and this FEIS as a result of public comment and to reflect updates in old-growth and mature allocations for spotted owl and other dependent species.

The four inventoried roadless areas within the Alpine Lakes Management Area are included under this plan with no change in present management. These are: Nason Ridge, Alpine Lakes Adjacent, Thorp Mountain, and Teanaway. They are being included here as a matter of information.

All of the roadless areas are within two to four hours travel time from major population centers such as Seattle-Tacoma, Tri-Cities, Yakima, and Wenatchee. Many are immediately adjacent to existing wildernesses or are within only a few miles of them.

One original RARE II area was previously sub-divided into smaller areas in order to address alternative ways of management as wilderness or non-wilderness prior to the passage of the Act. This was the Glacier Peak A, B, C, D, E, and F 6031 composite area. Most of the A, D, and F 6031 areas became wilderness under the Act as well as portions of C and E 6031.

All, or portions, of the following inventoried RARE II areas in the Glacier Peak area were not included in wilderness: Myrtle Lake, Rock Creek, Twin Lakes, Canyon Creek, and Heather Lake.

The public responses to the original RARE II composite area that now involves those five remaining areas, totaled 6,811. Of this total, 68 percent favored non-wilderness, 1 percent favored further planning, 13 percent favored wilderness with boundary adjustment and 18 percent favored wilderness as inventoried.

The timber figures shown for each area are based upon applying the Forest-wide average volume for each stand size class and ecotype to the acres involved in each of those categories.

The use season for all of these areas generally runs from late May-mid June to late October. Some winter use may occur at times.

Table C-1 on the next page indicates the history of the various areas beginning with their RARE II or Unit Planning Size Status and traces changes in them.

Table C-2 which follows shows identified roadless areas that are no longer being addressed for roadless status and the reasons why.

TABLE C-1
ROADLESS AREA SUMMARY-ORIGINAL AREA AND CURRENT AREA
AND REASON FOR THE CHANGE

Area Name	Forest Plan Inventory Name	1979 FEIS Acres	Computer Map Acres	FEIS/ Computer Difference	Reason for Difference	1985 Acres	Difference Acres	Reason for Difference

TABLE C-2
PREVIOUSLY IDENTIFIED ROADLESS AREAS THAT NO LONGER MEET
REQUIREMENTS FOR WILDERNESS CONSIDERATION AND REASON FOR CHANGE

Area Name	Reason No Longer Considered
Mirror Lake (Former 6031)	All but 148 acres were added to the Glacier Peak Wilderness in 1984.
Chipmunk (Former D6031)	All but 678 acres were added to the Glacier Peak Wilderness in 1984.
Indian Creek (Former D6031)	All but 106 acres were added to the Glacier Peak Wilderness in 1984.
Cady Creek (Former A6031)	All but 21 acres became part of the new Henry M. Jackson Wilderness in 1984.
Bethel	The area is less than 5,000 acres and no additional public interest has been expressed in recent meetings.

Table C-3 indicates the percentage of the inventoried roadless areas which have roadless management allocated to them by alternative. Table C-4 shows a summary of the total number of roadless areas having roadless management by alternative in addition to the total acres allocated to roadless management.

The tables following Table C-4 indicate the acres allocated to the various management prescriptions for each roadless area for each alternative.

MYRTLE LAKE

LEGEND

-  ROADLESS AREAS (1984)
-  ROADLESS ALLOCATION ALTERNATIVE C
-  OTHER ALLOCATIONS ALTERNATIVE C

C-20

MYRTLE LAKE ROADLESS AREA

Size: Gross Acres: 10,918

Net Acres: 10,918

I. GENERAL INFORMATION

A. History

Originally allocated to unroaded dispersed recreation under the Forest multiple use plan and Chelan Unit Plan. Studied for wilderness under Rare II as part of Glacier Peak Area No. E6031 and not recommended for wilderness. Reexamined for wilderness in 1984 and is currently that portion of E6031 not made wilderness under the Washington State Wilderness Act of 1984. Over 12,000 acres of the inventoried roadless area was added to wilderness in 1984.

B. Location and Access

The area lies adjacent to the Glacier Peak Wilderness in Chelan County on the Entiat Ranger District. Main access is gained by the Entiat River Road, from the town of Entiat, Washington, and the Entiat River trail from the road's end.

C. Physiography and Soils

This area is characterized by very wide and deep "U" shaped glacial valleys, with rough broken angular rocky ridges surrounding them. The valley bottoms are covered with conifer stands that have been dissected in many places by avalanche chutes. There are also many wet meadows that occur in the riparian zones.

Elevations range from about 3,300 to 7,800 feet. Most of the soils (59 percent) have developed in granitic residuum and the balance in deposits of volcanic ash and pumice. The granitic soils have a high bearing strength and remain in place better than the ash soils. The ash soils are easily displaced, because they are light and fluffy. Neither of these soils is slippery or sticky when wet, so are excellent for absorbing early and late season use. The ash soils are quite dusty when dry.

D. Climate

Precipitation ranges from 40 to 70 inches with an average of 50 inches. About 70 percent falls as snow which can range from 6 to 15 feet in depth.

E. Vegetation

Thirty-one percent of this area is tentatively suitable timberland. Most of this lies in the valley bottoms up to midslope and extending up side drainages. All of the area is classified as wet ecotype with the principal species being small diameter Douglas-fir, lodgepole pine, subalpine fir, and Englemann spruce. On the most productive sites, Pacific silver-fir is a common understory species.

Ridge tops in this area are open grass-forb communities with some wet areas and lakes. Avalanche paths create open corridors through the timbered valleys, increasing vegetative diversity and grass-forb-brush species similar to those that regenerate after fire or logging.

F. Current Uses

The current use is for recreation purposes. Major recreation activities and their estimated annual use are as follows:

<u>Activity</u>	<u>Estimated Annual Recreation Visitors Days</u>
ORV Trail Riding	835
Hiking	1,000
Horseback Riding	200
Mountain Climbing	100
Fishing	1,200
Hunting	300
Total	3,635

The area contains the following kinds and amounts of recreation opportunity spectrum (ROS) classes:

<u>ROS Class</u>	<u>Acres</u>
Semi-Primitive Non Motorized (SPNM)	1,485
Semi-Primitive Motorized (SPM)	9,433

There are 20.5 miles of trail in the area of which 18.0 miles are currently open to motorized use.

G. Appearance and Surroundings

The area has high visual variety of landform, vegetation, waterforms (lakes and streams), and rockforms.

The northeast half is within a basin surrounded by ridgetops and peaks. The basin has four tributary creeks and a variety of vegetation including fall color. Myrtle and Fern Lakes add to the diversity of waterforms in the area.

The area is primarily viewed as foreground and middleground from trails of the area.

The Myrtle Lake area is bounded by the Glacier Peak Wilderness to the north and the Entiat roadless area on the south.

The southwest half of the area is within the glaciated valley with steep side slopes and a variety of vegetative patterns. The ridgetops are open and rugged.

H. Attractions

Some major attractive features are the North Fork of the Entiat River, Myrtle and Fern Lakes, Pyramid Mountain, Devil's Smokestack, and the headwall of the North Fork of the Entiat River.

II. CAPABILITY-WILDERNESS CHARACTERISTICS

A. Manageability and Boundaries

The Myrtle Lake roadless area of the Wenatchee National Forest is that area of the Entiat District that is bounded on the northwest by the Glacier Peak Wilderness and on the southeast by the northern boundary of the Entiat roadless area. The southwest boundary is the summit of the Entiat Mountain range, and the northeast line is the summit of the Chelan Mountain range.

For the most part, the boundaries are located on identifiable features on-the-ground.

B. Natural Integrity

The impact of past human activity in this area is evident in the form of a steel girder bridge across the Entiat River and an adjacent helispot cut out of the Forest. There are approximately 18.0 miles of trails in this area that are now open to, and have a long history of, trail bike use. Also, there is an old fire lookout foundation on top of Duncan Hill. Although there are some evidences of man, the basic ecological processes have not been greatly altered.

C. Natural Appearance

The Myrtle Lake area in and of itself is a somewhat small area taking in segments of two major drainages, the main Entiat and the North Fork of the Entiat River. The deep, incised drainages, with heavy forest vegetation, conceal the evidence of human activity except when one is right at the site. From the ridges and high points it is possible to see distant roads and timber harvest activities several miles down valley.

D. Opportunities for Solitude

Although the area is small, as compared with adjacent areas, there are opportunities for solitude in several cirque basins that drain into the main Entiat and the North Fork.

E. Opportunities for Primitive Recreation

Although there are several tables and steel fire rings at different locations within this unit, there are several opportunities for primitive recreation experiences such as hunting, fishing, hiking, horseback riding, rock climbing, and viewing outstanding scenery.

F. Challenging Experiences

There are peaks and rock bluffs that offer challenge to rock and mountain climbers.

G. Special Wildlife Features

There are no known threatened or endangered wildlife species within the area. The extent of use in the area by sensitive species is unknown.

H. Historical and Scientific Study

There are no special unique opportunities for outdoor education and scientific or historic study in the area which cannot already be found in the existing wilderness on the Forest.

III. RESOURCES AND POTENTIALS

A. Recreation

The area has potential value for unroaded types of recreation activities. It contains one of the very few lakes accessible to bike riders. Estimated carrying capacity by ROS class is as follows:

ROS Class	Capacity in Potential Recreation	
	Visitors	Days Per Year
SPNM	1,500	
SPM	28,000	
	Total	29,500

B. Wildlife

The area provides summer range for a portion of the Entiat deer herd. There are scattered populations of mountain goat in the Chelan Mountain area between Pyramid Peak Big Hill and Emerald Peak. Grouse can be found throughout the area. The area is occasionally used by elk in the summer and a small black bear population.

C. Fish

In this area there are two lakes: Fern Lake and Myrtle Lake. Primarily eastern brook trout utilize Myrtle Lake. The lake is heavily fished because of easy access. Fern Lake has relatively good cutthroat trout fishing and there may also be Kamloops rainbow trout in the Lake. Fern Lake has very difficult access and, therefore, is not heavily fished.

This roadless area also contains portions of the Entiat River and the North Fork of the Entiat River. Both systems are inhabited by native cutthroat and rainbow trout. The Entiat River is heavily fished and probably has fairly good fisheries production. The North Fork of the Entiat is a shorter, more sterile, higher gradient stream and probably has low productivity and a fairly small trout population. The North Fork of the Entiat is not fished to any great extent.

D. Water

The area includes two storage precipitation gauges (annual) and three snow survey aerial markers.

The water quality (Nephelometric Turbidity Unit) flowing from this area is excellent. Turbidity levels annually average less than 5 NTU's. This roadless area provides a proportionally large percentage of the Entiat Basin runoff.

E.Livestock

The portion of this area within the main Entiat River drainage has no potential for domestic or recreation stock allotments due to topography or an almost complete lack of forage vegetation types. The portion in the North Fork Entiat River is currently part of the Pyramid Recreation Stock Allotment and receives use annually from both commercial outfitters and hunters stock. There is some potential for domestic livestock (sheep) if it were combined with Pyramid Creek and other areas farther to the south.

F.Timber

The area contains 3,434 acres of tentatively suitable timberland. Species are Douglas-fir, Pacific silver, and subalpine firs, Englemann spruce, and lodgepole pine. Other data is as follows:

Ecotype	Stand Size	Acres	Estimated Standing Volume (MMBF)	(MMCF)
Wet	Mature	1,484	42.1	7.7
Wet	Immature	1,929	34.7	6.4
Wet	Seedling-Sapling	21	---	
	Total	3,434	76.8	14.1

The estimated maximum biological potential contribution to the long-term sustained yield is 1.1 MMBF (0.2 MMCF) per year.

G.Minerals

This area is underlaid by pre-Cretaceous metamorphic rock and granitic rock of Mesozoic age. Surface deposits of pumicite derived from the eruption of Glacier Peak occur sporadically throughout the area, but they have not been adequately investigated for commercial value. The area around Milham Pass is underlaid by a rhyodacite plug, which contains disseminated sulfides (Church and Stotelmeyer, 1984). Based upon this, the U.S.G.S. and U.S.B.M. have identified the area around Milham Pass as having a "low" potential for the occurrence of base and precious metal resources in hydrothermal veins. According to Bureau of Land Management records (1/23/85), however, the area has had no mining claims located within it. The area is not classified "prospectively valuable" for any of the leasable commodities, and there are no existing leases, nor are there any pending lease applications.

H.Cultural-Historical

Historical information about the Myrtle Lake Unit is scanty. Duncan Hill, along the south margin of the Unit, was the site of a Forest Service fire lookout between 1923 and 1967. The surrounding country between the North Fork of the Entiat and the summit of the Chelan Mountains was part of the fur trapping territory of Gordon Stuart, whose permanent residence was at Domke Lake, near Lake Chelan. It is likely that some of his traplines may still be seen within the unit. American Indian uses of this area are completely unknown.

I.Land Use

There are no special land uses within the area.

J.Fire

Annual fire occurrence is low with half of the fires started by lightning and half being human-caused. Fuel loadings range from heavy accumulations of down fuels at lower elevations to scattered timber and meadows at higher elevations. Periodic large fires have occurred.

K.Insects and Disease

No serious insect or disease problems have been noted in this area since 1978. Spruce budworm damage was heavy during the period 1973-1976 in the lower elevation areas but was treated aerially in 1977 with Seven and budworms have not been a problem since.

L.Private Lands

There are no private lands within the area.

IV.NEED

A. Nearby Wilderness and Other Roadless Areas

This area is located immediately adjacent to the boundary of the existing 576,865 acre Glacier Peak Wilderness area and the Rock Creek and Entiat roadless areas.

B. Distance from Population Centers

The area is reachable within two to four hours' driving time from population centers such as Seattle-Tacoma, Yakima and the Tri-Cities.

C. Need for Ecosystem Representation

There are no special unique ecosystems within the area in need of representation through wilderness classification.

D. Interest by Proponents, Including Congressional

Since passage of the Washington State Wilderness Act of 1984, Congress has not expressed interest in making further additions to the State wilderness system. Environmental organizations have expressed interest in adding portions of the area to the National Wilderness Preservation System in the future.

Both environmental and ORV organizations have advocated maintaining roadless status for the area.

E. Public Input

Public input during the RARE II and other planning efforts was obtained and supported unroaded allocations. Response results are covered under the "General" portion at the beginning of this appendix.

F. Other Public Involvement

Public input solicited during the formulation of alternatives for this plan indicated much support for dispersed, unroaded recreation use for the area. There is a difference of opinion as to the allocation for motorized versus nonmotorized use.

V. Environmental Consequences

A. Environmental Consequences Associated with the Alternatives

1. Recreation

a. Significant Effects

The Myrtle Lake Roadless area consists of 10,918 acres that is located adjacent to the Glacier Peak Wilderness area on the Entiat Ranger District.

This area has been and is managed for dispersed recreation, ROS class semi-primitive motorized. There is a trail that is closed to motorized travel, the Fern Lake trail, 1.5 miles long, which has been closed to horses and bikes for over 10 years. There is long established trail bike use in the Myrtle Lake roadless area.

Management of this area under the land allocations in Alternative NC, A/NFMA and H would be very similar. However, in Alternative NC 1,951 acres would be entered for timber harvest.

Alternatives B and D would make access easier to focal points such as Myrtle Lake and Fern Lake. The close proximity of these focal points along with the fragile meadows in the North Fork drainage would invite increased pressure from day use.

Under these alternatives 16 percent of the Myrtle Lake Roadless Area would be entered for harvest and 1,951 acres would be taken out of the semi-primitive classification and converted to roaded natural.

Under Alternative C and I the portion of the trail system that is in this roadless area is allocated as follows:

Trail Name	Trail Number	Unroaded Non-Motorized	Unroaded Motorized	Roaded Motorized
Entiat River	1400	--	--	4.2
Cow Creek Meadows	1404	1.0	--	--
Myrtle Lake Camp	1404.2	--	0.4	--
Duncan Hill VP	1434.2	--	--	0.5
Anthem Creek	1435	--	--	3.3
Fern Lake	1436	1.5	--	--
NF Entiat	1437	3.3	--	--
Pyramid Mtn.	1433	6.3	--	--
Totals		12.1	0.4	8.0

Under Alternative E, the roadless allocation would be the same as Alternatives C and I, except there is no motorized use permitted.

Under Alternative F, the allocation for the whole area would be semi-primitive non-motorized.

Alternative G would be similar to A/NFMA, the current management situation, with no reduction in miles of trails available for motorized use.

Alternative J would be very similar to Alternatives B and D.

b. Summary

The following Tables indicate, by Alternative, the degree to which this area will be allocated to roadless management and, of the roadless management acres, what percent is 1/ motorized and non-motorized.

PERCENT OF THE AREA HAVING UNROADED ALLOCATION

ALTERNATIVE	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	100	82	100	82	100	100	100	100	100	82

PERCENT OF THE UNROADED ALLOCATION AREA
IN TERMS OF 1/ MOTORIZED/NON-MOTORIZED RECREATION

ALTERNATIVE	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	100/0	58/42	56/44	58/42	0/100	0/100	84/16	100/0	56/44	58/42

1/ These represent the semi-primitive motorized and semi-primitive non-motorized Recreation Opportunity Spectrum (ROS) Classes. The area being allocated to roaded types of management activities will become Roaded Natural or Roaded Modified ROS depending on the intensity of development.

The area being allocated to roaded management activities will have increased dispersed roaded recreation opportunities and the possible opening of access to potential developed recreation sites. The trail miles within the area allocated to roading will provide a less semi-primitive recreation experience with more area taking on a roaded natural or roaded modified appearance.

2 Wild, Scenic, and Recreational Rivers

A portion of the following river corridors (one-quarter mile each side of the river) is located within this roadless area and is recommended for designation in Alternatives C and I:

<u>River</u>	<u>Recommended Classification</u>
Entiat	Segment 2 Scenic

More information concerning this recommendation can be found in Chapter III and Chapter IV.

3. Cultural Resources

Consideration of cultural resource values are required by a special set of historic preservation laws, regulations, and policies. Particular efforts will be made in every alternative to inventory, evaluate, and provide for significant cultural resources in areas where Forest management activities are planned.

4.Scenery

Alternatives A/NFMA, C, E, F, G, H, and I will allocate the area to preservation and retention visual quality objectives. Alternatives B and D will have maximum modification of the lower North Fork and the Grouse Creek area. The valley bottom drainage of the Entiat will also be heavily altered under these alternatives. The location of the existing trail will be moved and existing trails will be lost.

The following table summarizes the Scenic component of this area by alternative in acres of Visual Quality Objective (VQO).

VQO	A/NFMA	B	C PREFERRED	Alternative		F	G	H	I	J
				D	E					
Preservation	--	--	--	--	827	742	--	--	--	--
Retention	10,918	9,264	10,918	9,264	10,091	10,176	10,918	10,918	10,918	9,244
Partial Retention	--	169	--	169	--	--	--	--	--	169
Modification	--	--	--	--	--	--	--	--	--	--
Maximum Modification	--	1,485	--	1,485	--	--	--	--	--	1,505
Total Acres	10,918	10,918	10,918	10,918	10,918	10,918	10,918	10,918	10,918	10,918

Preservation indicates that only natural, ecological changes will occur.

Retention indicates an essentially natural appearing landscape will be present.

Partial Retention indicates the landscape will be slightly altered.

Modification indicates a moderately altered landscape will be present.

Maximum Modification indicates a heavily altered landscape may be present.

5.Wildlife

Alternatives A/NFMA, G, and H would have the potential for impact on wildlife due to the large area of land available for motorized use. Alternatives B and D would have the most impact on wildlife due to roading of 18 percent of the area which would increase access to the area. Alternatives B and D would also impact habitat with timber harvest activities. Alternatives C and I would have less impact than any of the above mentioned alternatives due to a decrease in area open to motorized use. Alternatives E and F would not have any impact on the natural setting or the wildlife in this area.

6.Fisheries

a.Significant Effects on Fish

The vicinity of Fern and Myrtle Lakes and South Pyramid Creek would remain unroaded with implementation of any alternative. Therefore, the existing fishery conditions in these areas should remain unchanged.

In Alternatives A/NFMA, C, E, F, G, H, and I, the portions of the North Fork of the Entiat River and the main Entiat River included in this roadless area would remain unroaded. In Alternatives B, D and J the area surrounding the lower one-and-one-half miles of the rivers would be roaded and an intensive timber harvest regime would be implemented. The upper reaches of both rivers would remain unroaded.

Roading these areas could change the recreational fishing opportunities. Since about two-thirds of the Forest's fishing occurs in roaded areas, it is expected that recreational fishing would increase. This would help to meet a portion of the fishing demand (see Chapter III on fish), but also could result in overfishing and reduction in both numbers and size of fish using the habitat. However, since the wild fisheries production is thought to be very low in these headwater systems, fishermen are unlikely to fish intensively here and overfishing effects should not occur.

It is also possible that roading the unroaded areas could result in environmental degradation to streams due to timber harvest and road construction in the basins (see Chapter IV Environmental Consequences). Some of these possible effects are also addressed in the soil and water environmental effects.

b. Mitigation Measures

In the alternatives that could road presently unroaded areas along the main and North Forks of the Entiat, the riparian protection zone prescription, the Wenatchee National Forest's Best Management Practices (September, 1980 and revised October, 1982), and all standards and guidelines common throughout riparian areas of the Forest would be applied in stream zones. This treatment should adequately protect the streams from a reduction in fish habitat capability.

If the areas are roaded, road closures could be implemented to reduce the impact of enhanced access on the native fish populations.

7a. Vegetation: Trees

Most of this area will remain unroaded in all alternatives.

Vegetation changes will be only those occurring naturally and those minor changes along trails and campsites caused by recreation use.

Natural vegetative process will result in these unmanaged areas. These processes will result in increased mortality due to insect and disease and replacing the subclimax lodgepole pine and Douglas-fir species with climax species such as subalpine fir. Douglas-fir and lodgepole pine will remain a significant stand component as a result of fire killing the thin barked subalpine fir or as a result of some other catastrophic tree-killing event. Douglas-fir and lodgepole pine are the species that would be planted and managed for following harvest on 18 percent of the area under Alternatives B, D and J. No harvest would be permitted on any of these roadless areas under Alternatives E and F. All other alternatives would not schedule harvest, but would permit salvage if compatible with the roadless motorized recreation objective.

7b. Vegetation: Forage

This roadless area will remain roadless in most alternatives. Natural succession is expected to move toward tall brush and trees, which will reduce the forage base for both livestock and big game. Due to the relatively small size of this area and the limited potential for use by livestock, the loss of forage base will not be significant. This loss of forage for big game could be mitigated through the use of prescribed burning.

8. Soil and Water

a. Significant Effects

The environmental consequences of allocating the Myrtle Lake area to General Forest or Roadless Management are discussed by alternative below. No significant soil and water consequences are associated with Alternatives A/NFMA, C, E, F, G, H, and I because soil and water disturbing activities occurring would be minimal. Up to 18 percent of the area could be allocated to timber harvest and road building in Alternatives B, D and J. The environmental effects of timber harvest and road building are discussed in Chapter IV-Soil and Water sections.

The risk of degrading the soil and water resource increases with more timber harvest and road building Alternatives B and D pose more risk of degrading the soil and water resource than the other alternatives due to more intensive management. However, since Wenatchee National Forest Best Management Practices and Forest Plan Standards and Guidelines will be employed, no unique soil and water effects are expected to occur because of Forest management in this area.

b. Mitigation Measures

The mitigation measures that will be used in this area are the same as those discussed in Chapter IV-Soil and Water sections.

9. Air

There will be little additional prescribed burning generated in the Myrtle Lake roadless area as a result of the alternatives which would not have significant effects on air quality beyond those effects discussed in Chapter IV.

10. Minerals

Since this area appears to have a low potential for the occurrence of mineral resources, the consequences on mineral resources do not appear to be significant nor do they appear to vary appreciably by alternative. However, the management prescriptions under which the area would be managed in each alternative do restrict mineral activities to varying degrees (special stipulations in leases and in approved operating plans). For example, a withdrawal precludes all mineral related activities except those authorized by prior existing rights; and a designation as a roadless non-motorized area or as a developed recreation site, special area, or as a wild and scenic river calls for the area to be managed under highly restrictive management strategies. The cumulative effect of such restrictive management cannot be quantified, but the negative influence it would have on interest in conducting exploration activities within the area does vary by alternative and will, therefore, affect the potential for discovering and/or developing any unknown mineral resources of the area. The relative variation between alternatives is depicted on the following table.

CONSEQUENCES ON MINERAL RESOURCES

Restrictive Nature of Management Prescriptions	Acres Restricted by Management Prescriptions									
	A/NFMA	B	C PREFERRED	D Alternative	E	F	G	H	I	J
Withdrawn from Mineral Entry (valid existing rights will be determined and recognized)	0	0	0	0	0	0	0	0	0	0
Highly Restrictive	10,918	9,136	10,918	9,136	10,918	10,897	10,918	10,918	10,918	9,137
Moderately Restrictive	0	297	0	297	0	21	0	0	0	276
Relatively Few Restrictions	0	1,485	0	1,485	0	0	0	0	0	1,505

11. Roads

The miles of local roads shown below for each alternative are those that are expected to be constructed to permit timber harvest. They are included in the totals for the various alternatives shown in Chapter IV of the FEIS. It is assumed that the bulk of these roads will be constructed within the next 20 years. An analysis of the road development in unroaded areas during the past 10 years indicates that for every acre harvested approximately 5.5 acres are accessed. It is assumed that 50 percent of these roads will be closed to public traffic, and that the remainder will be suitable for travel by high clearance vehicles only.

These mileages are estimates based upon typical road densities necessary to harvest timber on different slope classes. The actual road miles that will result from the implementation of the various alternatives will be determined during project planning, design, and environmental analysis. The assumptions made for this analysis will be monitored. The construction of any road will be subject to the appropriate environmental analysis. That analysis will address the effects on resources that are dependent upon a roadless setting, including any adjacent roadless area or wilderness. The decision to close any road will be made on a case-by-case basis, according to the Forest Road Closure Policy found in the Forest-wide Standards and Guidelines.

ALTERNATIVES

	A/NFMA B		C	D	E	F	G	H	I	J
			PREFERRED							
ROAD MILES	0	6	0	6	0	0	0	0	0	6

12. Fire

The fire management workload generated in the Myrtle Lake roadless area as a result of the alternatives will not have a significant effect beyond the effects already described in Chapter IV.

A slight increase in risk of recreation related fires would occur from increased motorized use in Alternatives A/NFMA, G, and H, while Alternatives E and F would present the least amount of risk.

The cost efficiency of fire suppression activities will not vary significantly between alternatives since access patterns will not vary significantly.

13. Social/Economic

To measure this area in terms of its social value, a basic assumption is being made. This is, that because of the expressed interest in keeping as much of the inventoried roadless areas as possible in an unroaded condition, the more that condition is reflected, the higher the social value.

This condition is reflected for each alternative in the summary chart under item 1, Recreation, at the beginning of this section (Section V), which indicates the percentages of unroaded management

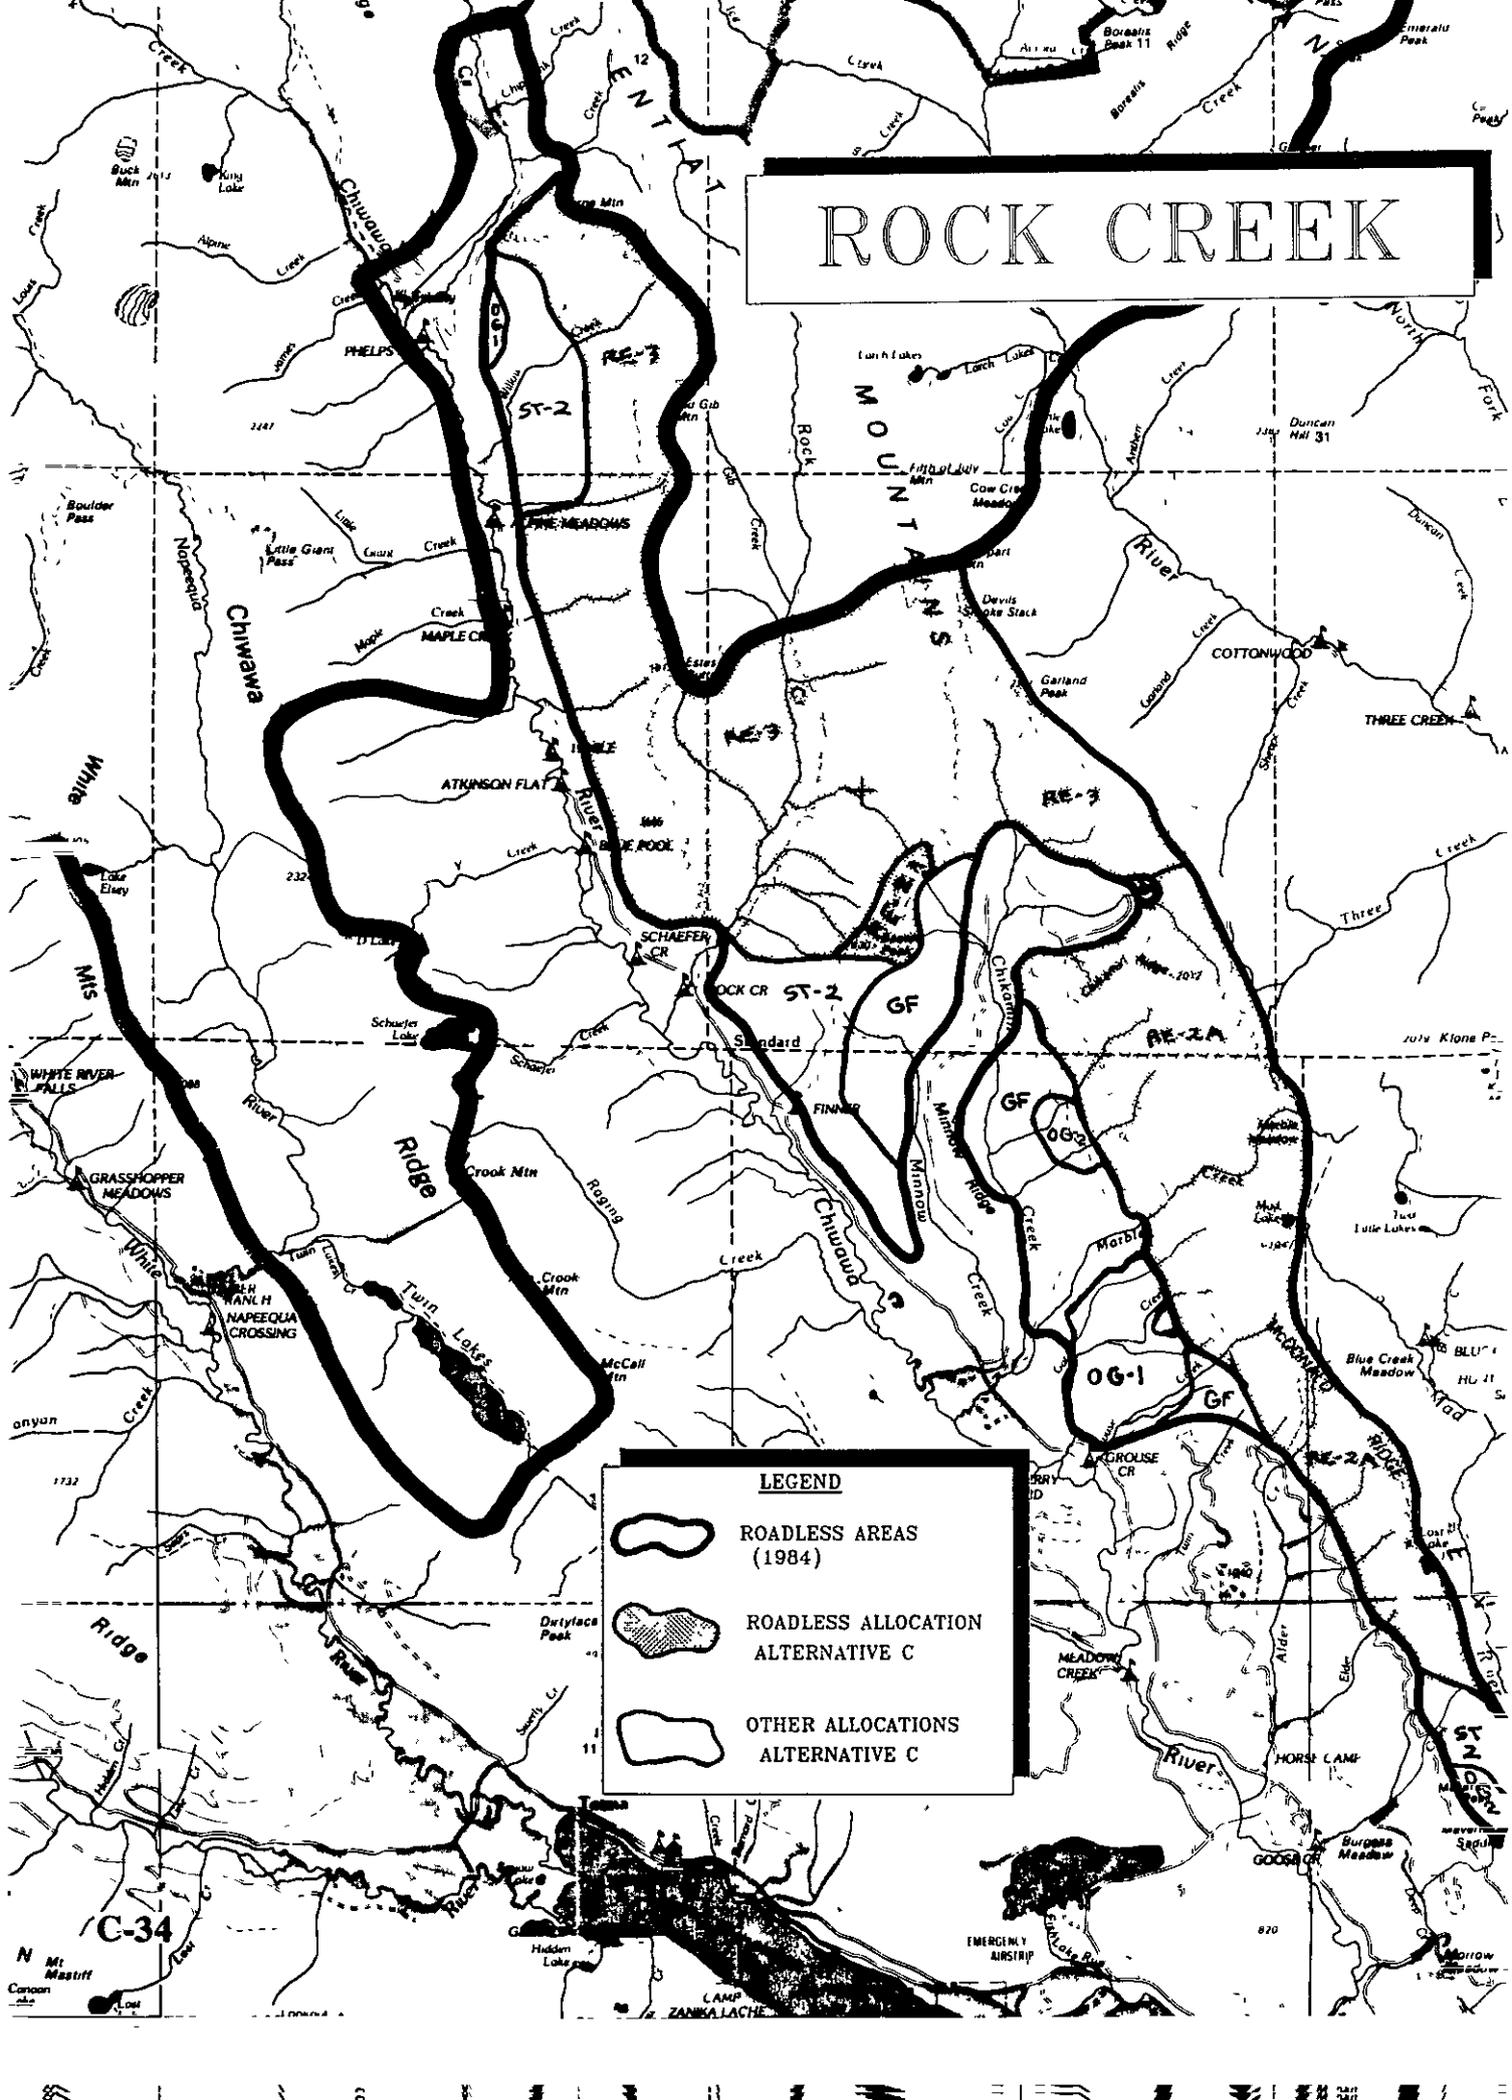

Also, as there is varying opinion as to the mode of transportation allowed, individuals must judge for themselves which alternative best meets that aspect of the social setting. There is also a summary table reflecting this condition for each alternative as referenced above which indicates the amount of motorized versus non-motorized use within the unroaded allocation.

A general measure of timber-oriented economic impacts can be made using the same table referenced above showing the amount of unroaded allocation. The larger the unroaded area, the greater the impact on timber-oriented jobs. If all of the estimated long-term sustained yield per year for this area were available, it would support 13.4 jobs.

14. Wilderness Potential

The roadless area has potential as wilderness; however, not as a unit by itself but as an addition to the Glacier Peak Wilderness. In all alternatives except B, D, and J, 100 percent of the roadless area will remain unroaded and in natural condition. In Alternatives B, D, and J, 18 percent of the area or 1,951 acres, would be allocated to roaded prescriptions. A total of 1,485 acres would be allocated to General Forest. In this allocation, roads would be constructed, timber harvested, vegetation would be managed, and the natural appearance of the area would be modified. Wilderness character would be foregone in these prescriptions.

ROCK CREEK ROADLESS AREA

Size: Gross Acres: 32,945

Net Acres: 32,924

I. GENERAL INFORMATION

A. History

The northeastern quarter was originally directed to unroaded, dispersed recreation as part of the Chelan unit plan. The western portion was allocated to dispersed, unroaded recreation as part of the Siwash Unit under the Forest multiple use plan.

A total of 6,487 acres of the area became part of the Glacier Peak Wilderness in 1984. The entire area was studied under RARE II as Area No. C6031 and was not recommended for wilderness.

B. Location and Access

The area lies between the Entiat Mountains to the east and the Chiwawa River on the west in Chelan County on the Lake Wenatchee Ranger District.

Major access is via the Chikamin and Chiwawa Roads and the Rock Creek, Carne Mountain, Basalt Ridge, Old Gibb, and Chikamin Trails.

C. Physiography and Soils

This area lies along the northeastern edge of the Chiwawa River. The Chiwawa River basin is a very wide and deep, glacially carved valley. The upper slopes of the Rock Creek roadless area is characterized by very long and steep west facing slopes that head up along McDonald Ridge. The lower slopes show evidence of glaciation, because they have been rounded and smoothed and in some places there is evidence of terrace remnants.

Elevations range from 2,500 to 7,500 feet. Most of the soils (59 percent) have developed in deposits of volcanic ash and pumice, and the majority of the rest have formed in granitic residuum. About four percent of the soils have developed in basaltic residuum, which tends to become slippery and sticky when wet, whereas, neither the ash nor the granitic soils do. The ash and pumice soils tend to be very light and fluffy and so can be easily displaced. Both soils are easily eroded by wind and water when the protective vegetation is removed. The granitic soils are more stable, and are able to withstand repeated traffic better than the ash soils. The ash soils are dusty when dry.

D. Climate

Annual precipitation averages between 45 and 90 inches with approximately 70 percent of the moisture falling as snow. An estimated 50 percent of the runoff emanates from the Glacier Peak Wilderness.

E. Vegetation

Fifty-two percent of this area is tentatively suitable for timber harvest. All but 361 acres are classified as moist ecotype, typified by Douglas-fir, Pacific silver fir, grand fir, and western hemlock. Western white pine and western red cedar are the most valuable commercial species present.

Understory species most common are vine maple, huckleberry species, false azalea, and mertensia. Avalanche paths encourage pioneer species such as Sitka alder, elderberry, mountain ash, and trailing blackberry.

Very few open areas, except avalanche paths and rock outcrops, occur in this area. Therefore, vegetative diversity could be enhanced by fire or timber harvest.

F. Current Uses

Major recreation activities and their estimated annual use are as follows:

Activity	Annual Recreation Visitor Days
Hunting	300
Hiking	600
ORV Trail Riding	700
Fishing	300
Horseback Riding	100
	Total 2,000

The area contains the following kinds and amounts of Recreation Opportunity Spectrum (ROS) Classes.

ROS Class	Acres
Primitive	9,900
Semi-Primitive Non Motorized	7,676
Semi-Primitive Motorized	15,328

There are 39.2 miles of trail in the area of which 20.9 are currently open to motorized use.

G. Appearance and Surroundings

The area has moderate to high visual variety of landform, vegetation, waterforms (lakes and streams), and rockforms.

The area is a south facing slope in a glaciated valley with steep side slopes, rugged ridges, avalanche paths, and a variety of vegetative patterns. A strong ridgetop (Entiat Mountains) has a variety of rockform and vegetation. Two lakes include Mad Lakes and Lost Lake.

The area is primarily viewed as middleground from the Chiwawa River road, and both foreground and middleground when viewed from the Entiat Mountain ridge top trail.

The Rock Creek area is surrounded by the Glacier Peak Wilderness, the Entiat roadless area, and Chiwawa River.

H. Attractions

Some of the major attractions within the area are Mad and Lost Lakes and panoramic scenic views from along McDonald Ridge in the southern tip of the unit.

II. CAPABILITY-WILDERNESS CHARACTERISTICS

A. Manageability and Boundaries

As roadless areas go, the boundary is probably more easily identified than most. The east side follows the ridge dividing Lake Wenatchee and Entiat Ranger Districts. The Glacier Peak Wilderness boundary on the north can be identified in most cases as well. The south and west boundaries are arbitrary and open to discussion. The identification of these is not possible on the ground with any degree of accuracy. The best feature for the south boundary would be Grouse Creek and for the west would be the Chiwawa River Road. The southern portion of the east boundary would be more identifiable if moved to McDonald Ridge. This would move both Mad and Lost Lakes into the Entiat Roadless area.

B. Natural Integrity

The area is bounded only by roads along the south, and roads and timber units on the west side. The Chikamin road creates a roaded neck partway across the center of the unit. There is a system of fairly extensive multipurpose trails within the area. Even with the extensive trail system, there are large blocks of land remaining undeveloped. The major scenic attractions are accessible. Some trail development is occurring to tie various trail systems together.

C. Natural Appearance

The area is large enough and the topography and vegetation such that visitors could get a feeling that they are away from human development. Roads and timber harvest areas can be seen from a number of vantage points but they do not dominate the viewshed.

D. Opportunities for Solitude

Opportunities for solitude are restricted. Some off-trail opportunities exist but they offer no scenic attractions to draw visitors.

E. Opportunities for Primitive Recreation

The trail system provides the best opportunity on the Lake Wenatchee Ranger District. It is the only area, besides Nason Ridge, that any real backcountry experience can be had. Nason Ridge is confined to a single ridge, however, with the experiences in Rock Creek being much more varied. It is the only area on the District that offers any real experience for non-traditional users (such as motorcycles and bicycles). It is currently available for use by larger groups than are permitted in the wilderness. However, compared to the potential of wilderness area, this area has very limited opportunities.

F. Challenging Experiences

A well developed trail system open to motorcycles offers a variety of experiences for motorcycle riders. Challenges to hikers and backpackers are not great but a trip of two to three days would be possible.

G. Special Wildlife Features

There are no known threatened or endangered wildlife species within the area. The extent of use in this area by sensitive species is unknown. Spotted owls have been located within the area.

H. Historical and Scientific Study

There are no special unique opportunities for outdoor education and scientific or historic study in the area which cannot already be found in the existing wilderness on the Forest.

III. RESOURCES AND POTENTIALS

A. Recreation

This area has potential value for unroaded types of recreation activities. It also contains some of the few lakes presently available to bikeriders. Estimated potential carrying capacity by ROS Class is as follows:

<u>ROS Class</u>	<u>Potential Capacity in Recreation Visitor Days Per Year</u>
Primitive(P)	7,900
Semi-Primitive Non-Motorized(SPNM)	7,700
Semi-Primitive Motorized(SPM)	<u>46,000</u>
Total	61,600

This is one of only two of the inventoried roadless areas having primitive recreation opportunities outside of Wilderness.

B. Wildlife

There are elk, deer, and black bear found on the area as well as grouse and their associated habitat. The area is summer range for a portion of the Entiat deer herd and for a small elk herd.

C. Fish

In this roadless area there are two lakes, Mad and Lost Lakes. Both have good resident fishing.

There are also two major stream systems included in the area, Rock and Chikamin Creeks. In Chikamin Creek there is anadromous fish use to at least Marble Creek and possibly steelhead trout use beyond. Both stream systems also have resident fish, probably including both cutthroat and rainbow trout.

D. Water

The Blue Creek Guard Station aerial snow marker was established in 1973 and has provided approximately 10 years of snow data. This site is no longer active.

The area is located mid-drainage, namely in the Chiwawa River headwaters originating in the Glacier Peak Wilderness and east of Chiwawa Ridge. The lower elevation is approximately 2,300 feet with upper elevations over 7,000 feet along Entiat Ridge.

There are currently no climatic or stream discharge facilities within the areas.

Water quality is generally high except during spring runoff or Chinook-generated peak flows. The meandering nature of the Chiwawa River in this area is highly prone to channel erosion and bank undercutting with subsequent stream loading with timber falling into the stream course as a result of bank failure.

The Chiwawa River has extremely high levels of woody debris resulting from bank failure or undercutting.

E. Livestock

Although this area lies within the boundaries of three existing allotments, two recreation and one domestic stock, range resource inventory maps show only three small meadows of usable forage in the upper portion of Chikamin and Marble Creeks. All three meadows are in the Lower Chiwawa Recreation Stock Allotment and are approximately ten acres each. They receive some hunter stock use in the fall but no commercial use. The rest of this roadless area is covered by varying age classes of dense timber, or has steep topography which limits potential for any class of livestock without vegetative manipulation.

F. Timber

The area contains 17,236 acres considered as tentatively suitable timberland:

Ecotype	Stand Size	Acres	Estimated Standing Volume (MMBF)	(MMCF)
Wet	Mature	5,724	162.2	29.8
Wet	Immature	11,003	197.9	36.3
Wet	Seedling-Sapling	148	---	
Dry	Mature	191	2.4	0.4
	Immature	170	1.7	0.3
	Total	17,236	364.2	66.8

The estimated maximum biological potential contribution to the long-term sustained yield is 5.6 MMBF (1.0 MMCF) per year.

G. Minerals

The geology of this area is very complex. It is not only highly faulted, but is underlaid by a complex association of Cretaceous nonmarine sedimentary rocks, pre-Upper Jurassic metamorphic rocks, Mesozoic granitic rocks, Tertiary volcanic rocks and glacial drift. Structurally, it lies within what is called the Chiwaukum graben, which, according to D'Arcy and others (1984), is a "structural zone where Tertiary - Cretaceous age sedimentary and Tertiary age intrusives interrupt a major Mesozoic age pluton by major faults."

This area lies within the Chiwawa Mining District, which is best known for the Royal Development, or Red Mountain Mine. The mine lies at the north end of the subject area and was active from 1929 to 1940 when it produced copper, silver, and gold. The mineralization at this property is associated with a breccia pipe at or near the contact of granitic and metamorphic rocks. According to the U.S.G.S. and U.S. Bureau of Mines (Map MF-1652-A), the northern part of the area near the Royal Development Mine has a "high" potential for occurrence of base metal resources in breccia pipes or disseminated porphyry deposits. These deposits would also contain gold and silver. The majority of the area lying south of Willow Creek has not been studied in detail by the U.S.G.S. and U.S.B.M., but it is reported to have occurrences of arsenic, talc, gold, tungsten, pumice and limestone, most of which have not been investigated adequately to determine if commercial deposits exist.

Of most interest is probably the gold occurrences in the metasedimentary rocks around Maverick Peak near the southeast end of the area. Traces of placer gold in drainages below the peak tend to confirm at least marginal potential. Discontinuous veins of copper and gold in the lower Rock Creek area and occurrences of gold in the metamorphics on the southeast side of Phelps Creek are also of interest. None of these occurrences have a record of past production, nor have they been explored in other than a superficial way.

The pumice is found throughout the area, but deposits of minable thickness (4+ feet) generally are limited to the north half. There has been interest in and some production of pumice from the Chikamin Creek area.

According to Bureau of Land Management records (January 23, 1985) 392 lode claims and five placer claims have been located within or immediately adjacent to the subject area. The majority of these were located in 1984, and except for nine lode claims, the assessment work has been maintained on those located earlier. A small part of the area between Rock Creek and Alder Creek has been classified "prospectively valuable" for coal resources, and the portion of the area lying north of Rock Creek has been classified "prospectively valuable" for geothermal resources. There are, however, no existing leases or pending lease applications within the area.

H. Cultural-Historical

It is likely that portions of the Rock Creek Unit were once utilized by the Wenatchi Indians in their travel and seasonal food collecting. The area includes a former reported Indian trail (south of Grouse Creek) to Mad Lake, and borders an ethnographically reported Wenatchee summer village site at Rock Creek, as well as an important rendezvous point on Chikamin Flats. Historic-era sites are the reported remains of a trappers cabin along Rock Creek, and the former emergency Basalt Peak fire lookout, dating from the 1920's. The area also experienced use by sheep grazing and mineral prospecting, and may include remnants of these uses.

I. Land Use

The area contains no special land uses.

J. Fire

Annual fire occurrence is low to moderate with most started by lightning. Fuel loadings are moderate to heavy accumulations at lower elevations to scattered alpine meadows at higher elevations. Periodic larger fires have occurred.

K. Insects and Disease

The Rock Creek area was heavily defoliated by spruce budworm in the mid-1970's and aerially sprayed in 1977. Since then spruce budworm populations have remained low. However, mountain pine beetles have killed a large portion of the valuable western white pine in this area and are presently killing lodgepole pine near Minnow Creek.

Robert Dolph, Regional Office entomologist, visited the Chikamin Creek area in 1981 to review the potential for a major mountain pine beetle development in the pole size pines in this area and found it to be high. Portions of this area are very high priority for harvest due to low access costs, high timber values, and high insect loss potential.

L. Private Lands

There is approximately 21 acres of other ownership near the southern tip of the area where it joins the Entiat roadless area.

IV. NEED

A. Nearby Wilderness and Other Roadless Areas

This area is located immediately adjacent to the eastern boundary of the 576,865 acre Glacier Peak Wilderness area and the Entiat and Myrtle Lake roadless areas.

B. Distance From Population Centers

The area is reachable within two to four hours driving time from population centers such as Seattle-Tacoma, Yakima, Tri-Cities, and Wenatchee.

ccThere are no special or unique ecosystems within the area which need representation through wilderness classification.

D. Interest by Proponents, Including Congressional

Since passage of the Washington State Wilderness Act of 1984, Congress has not expressed interest in making further additions to the State wilderness system. Environmental organizations have expressed interest in adding portions of the area to the National Wilderness Preservation System in the future.

Both environmental and ORV organizations and users have advocated maintaining roadless status for the area.

E. Public Input

Public input during the RARE II and other planning efforts was obtained and supported unroaded allocations. Response is covered under the General portion of this Appendix.

F. Other Public Involvement

Public input solicited during the formulation of alternatives for this plan indicated much support for dispersed, unroaded recreation use for the area. There are differing opinions as to the allocation for motorized or nonmotorized use.

V. ENVIRONMENTAL CONSEQUENCES

A. Environmental Consequences Associated with the Alternatives

1. Recreation

a. Significant Effects

This area contains a number of trails, many of which are open to ORV use. Some were reconstructed or built with State IAC funds set aside for ORV use. Alternative B and D are the only alternatives that do not provide scenic corridors or unroaded recreation status for these trails. These alternatives would have a significant effect on the character of much of the trail system within this area. Alternatives A/NFMA, C, H and I would restrict motorcycle use on some of the present open trails by allocating some of the trail system to Dispersed Recreation Non-Motorized. Alternatives E, F and G emphasize the unroaded allocation, with Alternative G as the alternative with the greatest allocation of semi-primitive motorized acreage. Under Alternative J emphasis is on roaded management with the least area allocated to unroaded recreation.

Under Alternatives C and I the Trail System for the area is as follows:

Trail Name	Trail Number	Unroaded Non-Motorized	Unroaded Motorized	Roaded Motorized
Mad Lake	1406	--	0.4	--
Garland Peak	1408	4.0	2.0	--
Mad River (upper)	1409.1	--	2.0	--
Pond Camp	1409.2	--	3.7	--

Totals		18.3	10.1	10.8

b. Summary

The following tables indicate, by alternative, the degree to which this area will be allocated to roadless management and, of the roadless management acres, what percent is motorized and non-motorized. These percentages represent the Semi-primitive Motorized and Semi-primitive Non-Motorized Recreation Opportunity Spectrum (ROS) Classes. The area allocated to roaded types of management activities will become Roaded Natural or Roaded Modified ROS opportunities depending on the intensity of development.

Percent of the Area Having Unroaded Allocation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	54	52	69	52	100	96	92	54	69	32

Percent of the Unroaded Allocation Area
In Terms of Motorized/Non-Motorized Recreation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	36/64	52/48	36/64	52/48	39/61	41/59	69/31	36/64	36/64	22/78

The area being allocated to roaded management activities will have increased dispersed roaded recreation opportunities and the possible opening of access to potential developed recreation sites. The trail miles within the area allocated to roading will provide a less semi-primitive recreation experience with more area taking on a roaded natural or roaded modified setting.

2. Wild, Scenic, and Recreational Rivers

A portion of the following river corridor (one-quarter mile each side of the river) is located within this roadless area and is recommended for designation in Alternatives C and I.

<u>River</u>	<u>Recommended Classification</u>
Chiwawa	Segment 2 Recreational

More information concerning this recommendation can be found in Chapter III and Chapter IV.

3. Cultural Resources

Consideration of cultural resource values are required by a special set of historic preservation laws, regulations and policies. Particular efforts will be made in every alternative to inventory, evaluate, and provide for significant cultural resources in areas where Forest management activities are planned.

4. Scenery

Alternatives A/NFMA and H will allocate the upper end of the ridgetop of the Chiwawa and Entiat Mountains, and the Rock Creek Basin, to Retention visual quality objectives. The McDonald Ridge and the trails in the area will be allocated to Partial Retention visual quality objectives. The view from the Chiwawa viewshed will be natural appearing. The middleground from the trails will be General Forest, or Maximum Modification visual quality objective (VQO).

Alternatives B and D will allocate the Devil's Smoke Stack area and the ridgetops of McDonald Ridge and Willow Creek Basin, to Retention VQO. The Willow Creek Basin, Rock Creek drainage bottom, and the midslope to the wilderness boundary, the lower one-half of Chikamin, Marble, Gale, and Grouse Creeks, and the Maverick Saddle area, will be allocated to General Forest, or Maximum Modification VQO. Parts of the area will be altered as viewed from the Chiwawa viewshed.

Alternatives C and I allocate three-quarters of the area to Retention VQO. Most trails will be allocated to Partial Retention VQO. The Chikamin Creek drainage lower valley bottom will be allocated to General Forest prescription, or Maximum Modification VQO. Glimpses of parts of the middleground from the Chiwawa River viewshed will be heavily altered.

Alternative E allocates all of the area to Retention VQO. The entire area will have a natural appearing landscape.

Alternative F will allocate virtually all areas to Retention VQO. A small area of the Mad River will be allocated to the Wild River prescription or Retention VQO.

Alternative G will allocate all areas to Retention and Partial Retention VQO. The Alpine Meadows area to the trailhead will be allocated to Scenic Travel Retention VQO.

Alternative J allocates the most area to Maximum Modification VQO and would have the most altered appearance.

The following table summarizes the Scenic component of this area by alternative in acres of Visual Quality Objective (VQO).

VQO	A/NFMA	B	Alternative		F	G	H	I	J	
			C PREFERRED	D						E
Preservation	-	--	-	-	-	-	-	-	-	
Retention	20,035	21,222	24,720	21,222	32,924	32,903	32,288	20,035	24,720	14,650
Partial Retention	6,783	360	4,028	360	-	21	636	6,783	4,028	1,357
Modification	-	-	-	-	-	-	-	-	-	-
Maximum Modification	6,106	11,342	4,176	11,342	-	-	-	6,106	4,176	16,917
Total Acres	32,924	32,924	32,924	32,924	32,924	32,924	32,924	<u>32,924</u>	<u>32,924</u>	<u>32,924</u>

Preservation indicates that only natural, ecological changes will occur.

Retention indicates an essentially natural appearing landscape will be present.

Partial Retention indicates the landscape will be slightly altered.

Modification indicates a moderately altered landscape will be present.

Maximum Modification indicates a heavily altered landscape may be present.

5. Wildlife

Alternatives A/NFMA and H would have one-half the impact on wildlife habitat of Alternatives B and D. Alternatives B and D would road 48 percent of the area, and would harvest timber on 39 percent of the area while Alternative J would road 68 percent. Alternatives C and I would have almost one-fourth the impact of B and D. This relationship is due to the amount of land allocated to General Forest. Alternative E would have no significant impact on wildlife. Alternatives F and G would have more impact than E due to the roading, but considerably less impact than the other alternatives.

6. Fisheries

a. Significant Effects

The vicinity of Mad and Lost Lakes would remain unroaded with implementation of any alternative, therefore, the existing fishery conditions of these lakes should remain unchanged.

In Alternatives E, F, and G, the Rock and Chikamin Creek areas would remain unroaded. In Alternatives B, D and J the land area surrounding these creeks could be roaded and a General Forest timber harvest regime would be implemented. Alternatives A/NFMA, C, H, and I could road and intensively harvest the Chikamin drainage but not the Rock Creek drainage. In Alternatives C and I, the lower Rock Creek area would be managed using primarily extended shelterwood timber harvest methods.

Roading these areas could change the recreational fishing opportunities. Since about two-thirds of the Forest's fishing occurs in roaded areas, it is expected that fishing would increase. This would help to meet a portion of the fishing demand (see Chapter III on Fish), but also could result in overfishing and reduction in both numbers and size of fish using the habitat.

It is also possible that roading the unroaded areas could result in environmental degradation to streams due to timber harvest and road construction in the basins (see Chapter IV; Environmental Consequences). Some of these possible effects are also addressed in the soil and water environmental effects.

b. Mitigation measures

In the alternatives that could road presently unroaded areas along Rock and Chikamin Creeks, the riparian protection zone prescription, the Wenatchee National Forest's Best Management Practices and all standards and guidelines common throughout riparian areas of the Forest would be applied in stream zones. This treatment should adequately protect the streams from a reduction in fish habitat capability.

If the areas are roaded, road closures could be implemented to reduce the impact of enhanced access on the native fish populations.

7a. Vegetation: Trees

Under all alternatives except Alternative J, it is expected that more area will remain unroaded than is roaded. The range of tree management activities is from 16,918 acres (51 percent) scheduled for timber emphasis in Alternative J to no scheduled harvest in Alternative E.

Alternatives A/NFMA and H has 6,106 acres (19 percent) timber emphasis and an additional 7,526 acres of vegetation manipulation with other resource emphasis planned.

Alternatives C and I have identical acre allocations. Both have 4,176 acres of timber emphasis, or 13 percent of the area. An additional 9,350 acres would be managed for other resource values that permit vegetative manipulation through timber sales. The primary difference between Alternatives C and I is the rate of harvest. Under Alternative I, more harvest activity would be scheduled in the first five decades.

Alternatives F and G do not allocate any acres to timber emphasis. However, they do anticipate vegetative manipulation through timber sales on 1,654 to 2,522 acre or five to eight percent of the area.

7b. Vegetation: Forage

Alternatives C, H, and I, with the proposed vegetative manipulation and improved access, will contribute adequate forage to the base needed for big game and livestock. Alternatives A/NFMA, B, D and J will provide forage in excess of projected needs. Alternatives E, F, and G which have little or no vegetative manipulation proposed, will not provide adequate forage to meet the projected needs for livestock, particularly in the fourth and fifth decades. Prescribed fire in the remaining unroaded portion of this area could offset the loss of forage for big game due to ecological succession.

8. Soil and Water

a. Significant Effects

The environmental consequences of allocating the Rock Creek Area to General Forest or Roadless Management are discussed by alternative below. No significant soil and water consequences are associated with Alternative E because soil and water disturbing activities occurring would be minimal. Alternatives A/NFMA, B, C, D, F, G, H, I and J allocate up to 51 percent of the area to timber harvest and road building. The environmental effects of timber harvest and road building are discussed in Chapter IV - Soil and Water sections.

The risk of degrading the soil and water resource increases with more timber harvest and road building. Alternatives A/NFMA, B, C, D, H, and I pose more risk of degrading the soil and water resource than Alternatives F and G due to more intensified management. However, since Wenatchee National Forest Best Management Practices and Forest Plan Standards and Guidelines will be employed, no unique soil and water effects are expected to occur because of forest management in this area.

b. Mitigation Measures

The mitigation measures that will be used in this area are the same as those discussed in Chapter IV - Soil and Water sections.

9. Air

The additional prescribed burning generated in the Rock Creek roadless area as a result of the alternatives would not have a significant effect on air quality beyond the impacts discussed Chapter IV.

The close proximity to the Glacier Peak Wilderness Area would increase the risk of a smoke intrusion into the Class I area from Alternatives B and D.

10. Minerals

As the previous discussion indicates, the area is encumbered by 392 lode claims and 5 placer claims, and the area is considered to have a “high” potential for the occurrence of base metal deposits, often in association with precious metals. It also is reported to have occurrences of arsenic, talc, gold, silver, tungsten, pumice, and limestone, none of which have been investigated adequately to determine if commercial deposits exist. Portions of the area have also been classified prospectively valuable for coal and geothermal resources. Since none of the alternatives call for withdrawing any part of the area from mineral entry, the consequences on mineral resources do not appear to be extremely significant nor do they vary appreciably by alternative. However, the management prescriptions under which the area would be managed in each alternative do restrict mineral related activities to varying degrees (i.e., special stipulations in leases and approved operating plans). The effects of these restrictions cannot be quantified, but the negative influence they would have on interest in conducting exploration activities within the area does vary by alternative and will, therefore, affect the potential for discovering and/or developing any unknown mineral resources of the area. This relative variation between alternatives is depicted on the following table.

CONSEQUENCES ON MINERAL RESOURCES

Restrictive Nature of Management Prescriptions	Acres Restricted by Management Prescriptions									
	A/NFMA	B	C PREFERRED	D	Alternative		G	H	I	J
					E	F				
Withdrawn from Mineral Entry	0	0	0	0	0	0	0	0	0	0
(valid existing rights will be determined and recognized)										
Highly Restrictive	20,818	20,861	25,081	20,861	32,924	32,118	30,952	20,818	25,081	15,370
Moderately Restrictive	6,000	721	3,667	721	0	806	1,972	6,000	3,667	636
Relatively Few Restrictions	6,106	11,342	4,176	11,342	0	0	0	6,106	4,176	16,918

11. Roads

The miles of local roads shown below for each alternative are those that are expected to be constructed to permit timber harvest. They are included in the totals for the various alternatives shown in Chapter IV of the FEIS. It is assumed that the bulk of these roads will be constructed within the next 20 years. An analysis of the road development in unroaded areas during the past ten years indicates that for every acre harvested approximately 5.5 acres are accessed. It is assumed that 50 percent of these roads will be closed to public traffic, and that the remainder will be suitable for travel by high clearance vehicles only.

These mileages are estimates based upon typical road densities necessary to harvest timber on different slope classes. The actual road miles that will result from the implementation of the various alternatives will be determined during project planning, design, and environmental analysis. The assumptions made for this analysis will be monitored. The construction of any road will be subject to the appropriate environmental analysis. That analysis will address the effects on resources that are dependent upon a roadless setting, including any adjacent roadless area or wilderness. The decision to close any road will be made on a case by case basis, according to the Forest Road Closure Policy found in the Forest-wide Standards and Guidelines.

	<u>Alternative</u>									
	A/NFMA	B	C	D	E	F	G	H	I	J
			Preferred							
Miles	40	50	41	50	0	4	10	40	41	50

12. Fire

The fire management workload generated in the Rock Creek roadless area as a result of the alternatives will not have a significant effect beyond the effects already described in Chapter IV.

A slight increase in risk of recreation related fires would occur from increased recreation use in Alternatives E, F, and G, while a slight increase of industrial fires would occur in Alternatives B, D and J. Risk of fire would change little in Alternatives A/NFMA, C, H, and I.

The cost efficiency of fire suppression activities would be slightly increased in Alternatives B, D and J as road access would allow for more area to be covered by ground based suppression resources. Cost efficiency levels in Alternatives E, F, and G would be less due to slower initial attack by ground forces or requiring the use of more expensive aerial delivered resources such as helitack or smokejumpers.

The impacts generated by slash disposal activities are discussed in Chapter IV.

13. Social/Economic

To measure this area in terms of its social value, a basic assumption is being made. This is, that because of the expressed interest in keeping as much of the inventoried roadless areas as possible in an unroaded condition, the more that condition is reflected, the higher the social value.

This condition is reflected for each alternative in the summary table under item 1, Recreation, at the beginning of this section (Section V), which indicates the percentages of unroaded management.

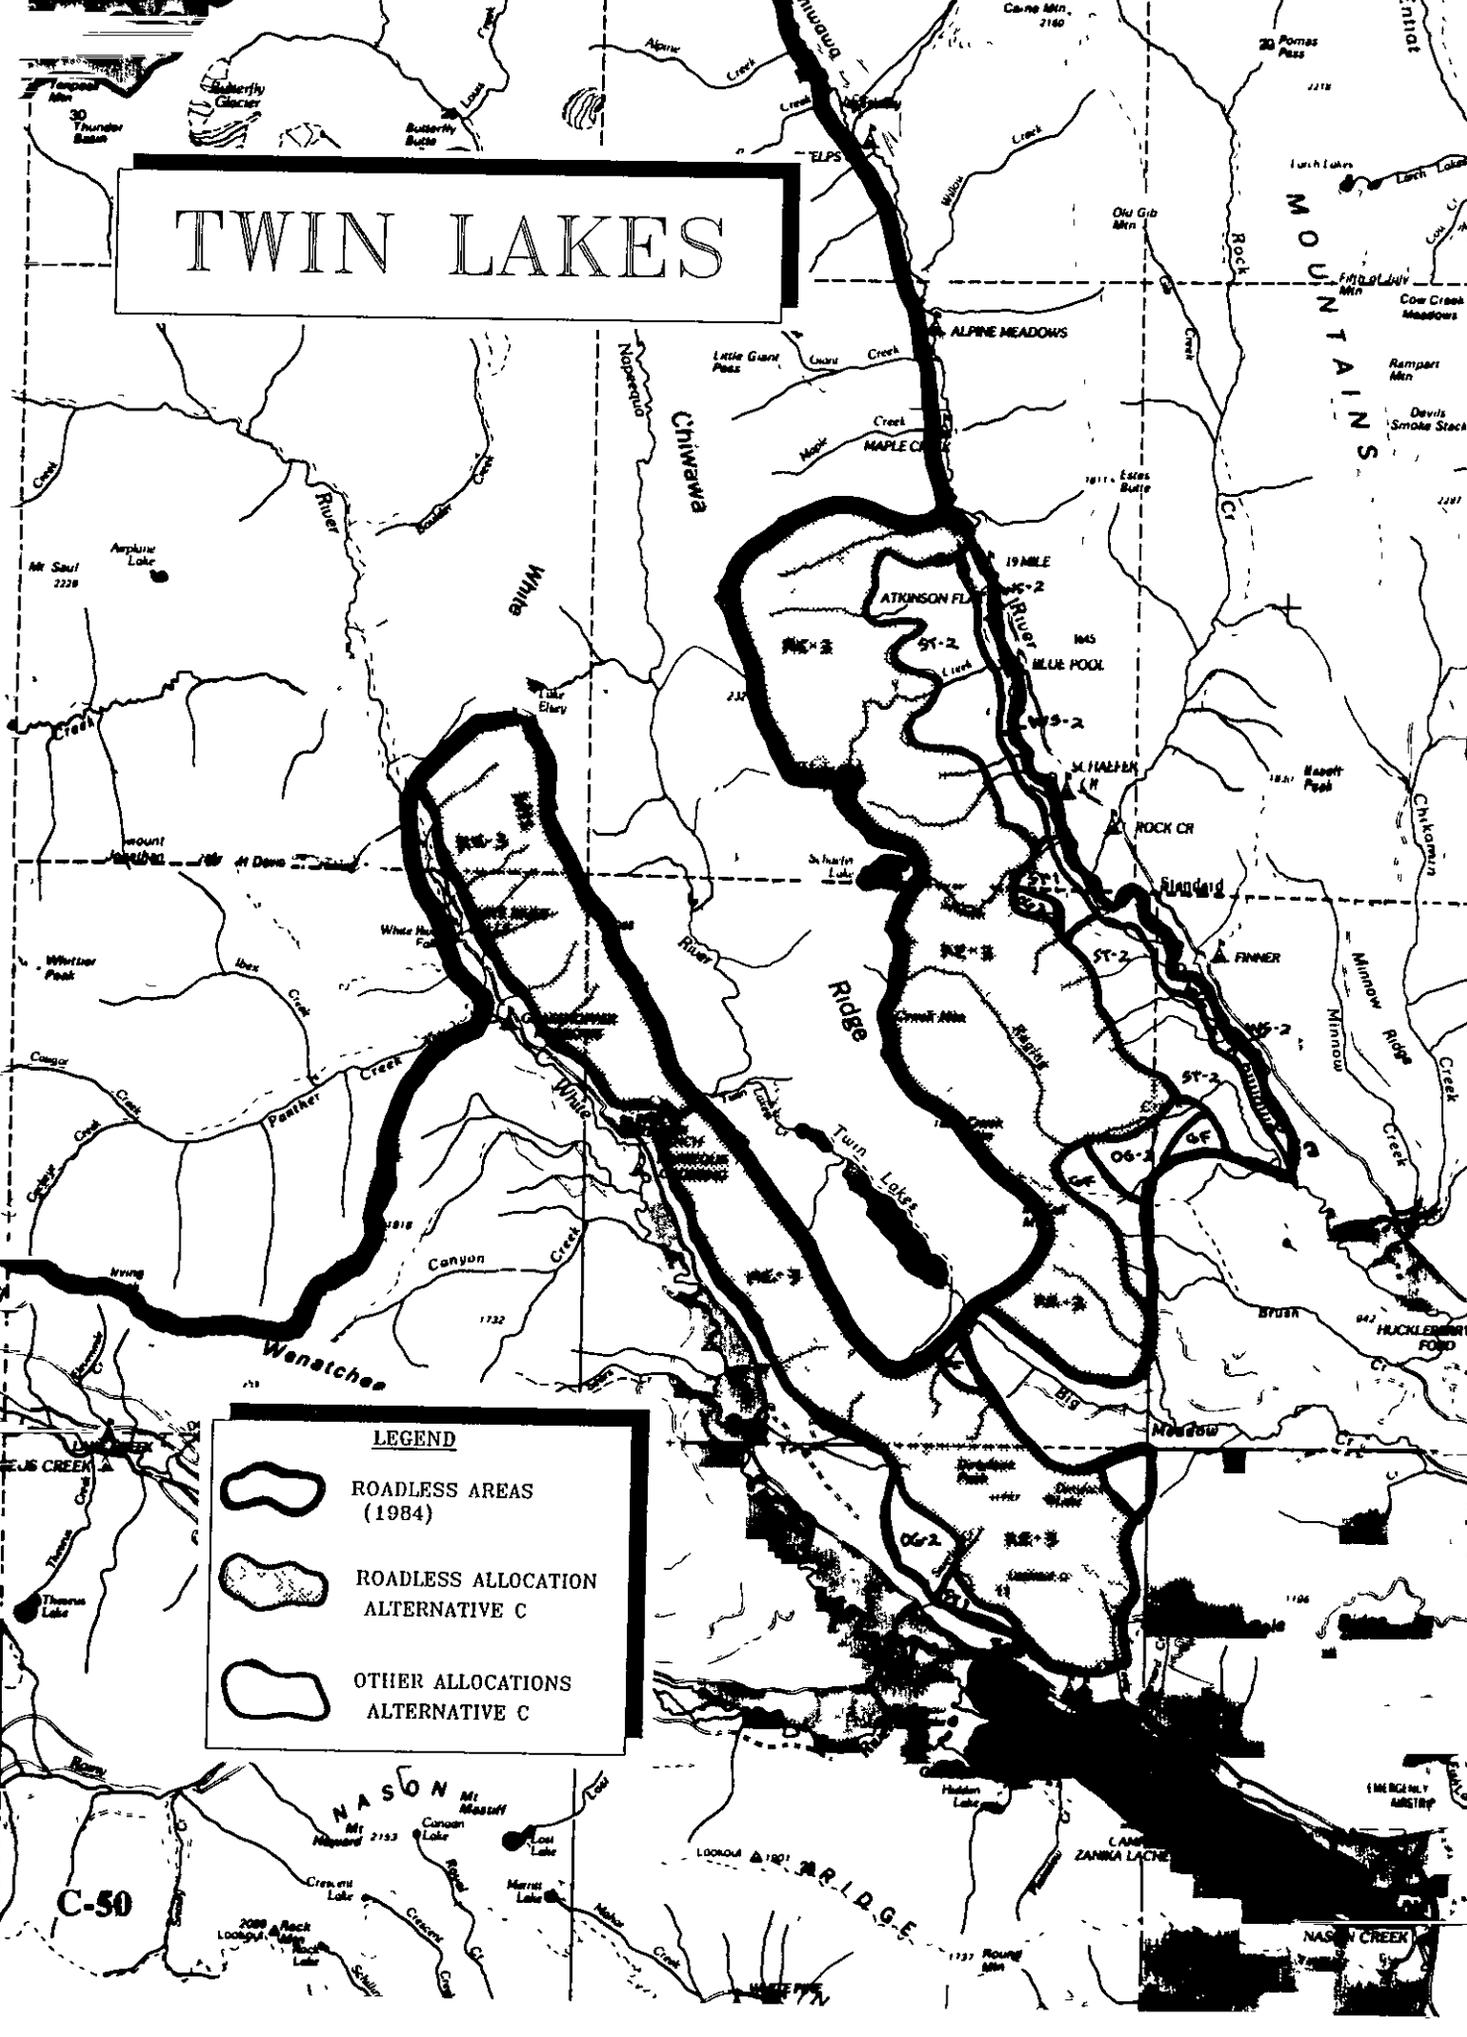

Also, as there is varying opinion as to the mode of transportation allowed, individuals must judge for themselves which alternative best meets that aspect of the social setting. There is also a summary table reflecting this condition for each alternative as referenced above which indicates the amount of motorized versus non-motorized use within the unroaded allocation.

A general measure of timber-oriented economic impacts can be made using the same table referenced above showing the amount of unroaded allocation. The larger the unroaded area, the greater the impact on timber-oriented jobs. If all of the estimated long-term sustained yield per year for this area were available, it would support 87.3 jobs.

14. Wilderness Potential

The roadless area is suitable as wilderness. The area is large enough to be a separate entity but more logically has potential to be an addition to the Glacier Peak Wilderness. Alternatives A/NFMA, B, C, D, H, I, and J all propose similar acreage allocated to development prescriptions, 52 percent to 70 percent would remain unroaded. Alternatives B, D, and J would result in the greatest change with 34 percent, or 11,342 acres, allocated to General Forest. Alternatives, E, F, and G would keep the total area in an unroaded condition. Alternatives A/NFMA and H allocate more acres to General Forest than C and I and would result in more loss of wilderness character. Roads, evidence of timber harvest, and modification of natural appearances would occur in General Forest and other allocations which have some level of timber harvest and commodity development.

TWIN LAKES

LEGEND

-  ROADLESS AREAS (1984)
-  ROADLESS ALLOCATION ALTERNATIVE C
-  OTHER ALLOCATIONS ALTERNATIVE C

TWIN LAKES ROADLESS AREA

Size: Gross Acres: 22,133

Net Acres: 22,048

I. GENERAL INFORMATION

A. History

The area has a history of unroaded, recreation management through the original multiple use plan and as part of the Siwash area under unit planning. It was studied under RARE II as part of Unit C 6031 and was not recommended for Wilderness. Further consideration was given during preparation of the Washington State Wilderness Act of 1984 under which 5,661 acres of the November 1983 inventoried roadless area, including Twin Lakes, were made a part of the Glacier Peak Wilderness.

B. Location and Access

This area is located adjacent to the Glacier Peak Wilderness in Chelan County on the Lake Wenatchee Ranger District. It exists in two parts, the northeastern and southwestern portions which are separated by the Twin Lakes additions to Glacier Peak.

Major access routes are as follows: for the northeastern portion, the Chiwawa, Brushy Creek and Meadow Creek roads, and the Schaefer Lake and Raging Creek trails; for the southwestern portion, the Big Meadow Creek and Upper White River roads and the Dirty Face Peak Trail.

C. Physiography and Soils

This area occurs within the very wide and deep Chiwawa and White River basins. Both drainageways are characterized by the distinctive "U" shaped glacial features. The glacial features are most evident in the lower slope positions, while the upper positions, like those found along Chiwawa Ridge, are made up of rough broken rocky features.

Elevations range from 2,500 to 6,900 feet. Most of the soils (52 percent) have developed in granitic residuum, and the majority of the rest have developed in volcanic ash and pumice deposits. There are minor amounts of soils that have developed in basaltic residuum, glacial till, alluvium, and Swauk sandstone. The basaltic materials and the Swauk sandstone derived soils can be very slippery and greasy when wet and both are subject to water erosion and are easily compacted. The granitic soils withstand traffic very well and usually hold up well even when wet. Ash soils are very dusty when dry and are easily eroded if the surface is bare and subject to overland flow.

D. Climate

Precipitation ranges from 50 to 80 inches annually, falling mostly as snow.

E. Vegetation

One-third of this area is tentatively suitable for sustained timber production. As most of the suitable area is on north slopes except along the Chiwawa River, the ecotype is primarily wet conifer forest. Douglas-fir is the major species. Western white pine, Englemann spruce, western red cedar, western hemlock, and Pacific silver fir are also present especially along the Chiwawa River.

The only low elevation non-forested areas are the open, rocky, south aspect along Big Meadow Creek and the smaller, steep, open, sandstone south facing area north of Raging Creek.

Lodgepole pine has gradually encroached upon the open huckleberry fields near McCall Mountain, once important berry gathering areas for Indians.

F. Current Uses

The use is for dispersed recreation. The major activities and their estimated annual use are as follows:

<u>Activity</u>	<u>Estimated Annual Recreation Visitor Days</u>
Hiking	700
Hunting	100
Total	800

The area contains the following kinds and amounts of Recreation Opportunity Spectrum (ROS) Classes:

<u>ROS Class</u>	<u>Acres</u>
Primitive (P)	13,377
Semi-primitive Non-Motorized (SPM)	8,671

There are 11.9 miles of trail within the area, of which 8.2 miles are open to motorized use.

G. Appearance and Surroundings

The area has high visual variety of landforms and rockforms, moderate to high variety of vegetation. It contains numerous small creeks, and is low in waterforms (lakes and streams).

Approximately one-half of the area is on a north facing slope of the glaciated Chiwawa River Valley. The area has highly textured vegetation on steep slopes intermingled with rockforms. Approximately 15 small drainages bisect the area.

The other half of the area is the south facing slope of the glaciated White River Valley. The upper slopes have steep sides, avalanche paths, a variety of vegetative patterns and ridgetops that are open and rugged.

Landforms include Dirty Face Peak, McCall Mountain, Crook Mountain and ridgetops of the White Mountain and Chiwawa.

The Twin Lakes area is surrounded by the Glacier Peak Wilderness, Chiwawa River drainage, White River drainage, and multiple-use land.

H. Attraction

Some major attractive features are McCall Mountain, Chiwawa Ridge, Dirty Face Mountain, Crook Mountain, and Raging and Schaefer Creeks.

II. CAPABILITY-WILDERNESS CHARACTERISTICS

A. Manageability and Boundaries

The area is divided into two parts which are split by a road corridor and a finger of the Glacier Peak Wilderness. The northeastern half is about twice the size of the southwestern half. Both halves are bounded on two sides by the Glacier Peak Wilderness. They are surrounded by roads on all other sides. The only easily identifiable boundary is the east boundary of the northeastern half which is the Chiwawa River.

B. Natural Integrity

Impact of human activity has been minor. Some trail development is evident. About one mile of the Twin Lakes Trail and one and a half mile of Dirty Face Trail are in the southwestern half, and about four miles of Shaeffer Lake Trail and two miles of Raging Creek Trail are in the northeastern half. Twin Lakes Trail and Shaeffer Lake Trail access the Glacier Peak Wilderness. There is an old lookout site on Dirty Face Mountain. This was removed but signs of its remains are still evident

C. Natural Appearance

The southwestern half is very narrow and there are some areas where a visitor could be free from the sights and sounds of human activity. The northeastern half is large enough and has several small drainage basins where a visitor could feel separated from human developments. The area from outside looking in, has a very natural appearance. This is particularly true of the rugged area north of the White River Road and of the area south of the Chiwawa River.

D. Opportunities for Solitude

With the exception of the Raging Creek Trail, the developed trails are used to such an extent that there is little opportunity for solitude. The Dirty Face Trail is presently often used by large groups on day hikes. With the additional wilderness established in 1984, it is one of the few areas where use by large groups can occur. Much of the area of the developed trail is either heavy brush and old-growth timber or steep, rocky cliffs.

E. Opportunities for Primitive Recreation

These opportunities are limited to the few miles of trail systems. The old lookout site on Dirty Face Mountain offers spectacular views of the surrounding valleys and ridges. There are no other destination areas within the roadless area of any note. The Raging Creek drainage is used by hunters on an annual basis.

F. Challenging Experience

Except for the number of switchbacks or the grade of the trails, there is little to draw visitors in terms of a challenge. Some interesting opportunities for such experience could be had by trying to find routes to the Glacier Peak Wilderness through the rocky cliffs above the White River.

G. Special Wildlife Features

There are no known threatened or endangered wildlife species within the area. The extent of use in this area by sensitive species is unknown.

H. Historical and Scientific Study

There are some opportunities for outdoor education and scientific or historic study in the area relating to past use and events.

III.RESOURCES AND POTENTIALS

A. Recreation

The area has potential value for unroaded types of recreation activities.

Estimated carrying capacity by ROS Class is as follows:

Capacity in Potential Recreation Visitor Days Per Year

<u>ROS Class</u>	
Primitive	10,700
SPNM	<u>8,700</u>
Total	19,400

This is one of only two of the inventoried roadless areas having primitive recreation opportunities outside of wilderness.

B. Wildlife

In addition to deer, black bear, and other game and non-game species, the area has mountain goats along Chiwawa Ridge, on McCall Mountain, and Dirty Face Peak. This area is summer range for a portion of the Oklahoma Gulch deer herd.

C. Fish

This area includes many small streams which are tributary to both the Chiwawa and White Rivers. However, only two are known to have any significant number of fish: Schaefer and Raging Creeks. Schaefer Creek drains Schaefer Lake which is stocked by the Washington State Department of Game. There are probably both Eastern brook trout and cutthroat trout using the system. The creek itself is steep a gradient, and does not have very high production. Raging Creek has a population of cutthroat trout and possibly rainbow trout. It too is not a major fishery.

In this area there is also a very short reach of the Napeequa River which is an anadromous fish stream. Sockeye, and possibly chinook salmon spawn in this area of stream.

D. Water

There is currently a power withdrawal site filed under FERC #2151 (Wenatchee River Project). A portion of the withdrawal site lies within Section 36, T28N, R16E. This project was surrendered or "given up" by the Chelan County PUD #1 several years ago. If constructed, water would have been impounded on portions of Section 1, T28N, R16E WM.

An additional encumbrance also exists within this area. Under Executive Order of 5/8/12, the U.S. Geological Survey designated all lands lying within one mile either side of the Chiwawa River as withdrawn sites. Lands lying within portions of Sections 18, 19, 20, and 29 and T28N, R16E WM. have been encumbered by the obsolete Executive Order.

E. Livestock

A portion of this area in Chiwawa Creek drainage is within the Lower and Upper Chiwawa Recreation Stock Allotments. The range resource inventory maps do not show any forage vegetative types in this roadless area. The dense timber vegetation, in addition to very steep topography, severely limits the potential for either recreation or domestic stock use even with vegetative manipulation.

F. Timber

The area contains 7,250 acres of tentatively suitable forest land categorized as shown below:

Ecotype	Stand Size	Acres	Estimated Standing Volume (MMBF)	(MMCF)
Wet	Mature	3,668	104.0	19.1
Wet	Immature	3,286	59.1	10.8
Wet	Seedling-Sapling	127		
Dry	Mature	127	1.603	
Dry	Immature	42	0.401	
	Total	7,250	165.1	30.3

The estimated maximum biological potential contribution to the long-term sustained yield is 3.1 MMBF, or 0.6 MMCF, per year.

G. Minerals

This area is primarily overlaid by granitic rock of Mesozoic age, but is also overlain in part along the westside by pre-Tertiary metamorphic rock. The Napeequa River area, which lies adjacent to the subject area, has been investigated by the U.S.G.S. and U.S. Bureau of Mines. As a result of their investigations, they have not identified the area as having any known mineral potential. The area has no reported occurrences of mineral commodities of interest; however, an area around Raging Creek has been classified "prospectively valuable" for coal resources and those portions of the area lying north of Schaefer Creek and north of White River Falls have been classified prospectively valuable for geothermal resources. According to Bureau of Land Management Records (1/23/85), 32 lode claims and 4 placer claims have been located within or immediately adjacent to that portion of the area lying along the Chiwawa River, and assessment work has been maintained on these claims through 1984. Even though portions of the area are classified "prospectively valuable" for leasable commodities other than oil and gas, only a small portion of the area is leased and it is leased for oil and gas under OR 29079 and OR 29080. There are no pending lease applications within the area.

H. Cultural-Historical

The area has a high potential for the occurrence of significant archaeological resources. The backcountry between McCall and Crook Mountains was traditional huckleberry picking country. Indian families camped here for two to three weeks each year to collect and dry huckleberries and undertake small hunting expeditions. Access was by way of a trail up Raging Creek (a portion of the original tread still exists). The upper Raging Creek country was also the scene of a reported encounter (and possible massacre) in 1858 between the Wenatchi Indians and the United States militia. The Twin Lakes unit also borders an area along the White River that was used both as a fishery and as a spirit quest site. Because of this history, it is possible there is a special spiritual link between the lands within the Twin Lakes unit and present day Wenatchee people on the Colville and Yakima Indian Reservations.

I. Land Use

There are no special land uses within the area.

J. Fire

Annual fire occurrence is moderate with most started by lightning. Fuel loadings are moderate with heavy accumulations at lower elevations, to scattered accumulations in alpine meadows at higher elevations. Periodic large fires have occurred.

K. Insects and Disease

As more than 3,600 acres of mature timber occurs in this area, bark beetles are a high risk. Timber having heavy losses to Douglas-fir bark beetle, and root rot was mapped and sold in the Upper Huck timber sale immediately adjacent to the south of this area. Because the Twin Lakes area was in the Siwash study area at the time, no timber was sold north of Raging Creek.

Heavy salvaging of western white pine killed by mountain pine beetle has occurred along the Chiwawa River, but salvage did not extend south of the river. The 1984 aerial survey of insect damage mapped several small, beetle-killed stands along the Chiwawa in the unroaded area.

L. Private Lands

There are 85 acres of non-federal lands within the southwestern portion. A portion of these lands are part of the Tall Timber Ranch, a private organization camp. Access to these lands is gained from outside of the area.

IV. NEED

A. Nearby Wilderness and Other Roadless Areas

This area is located immediately adjacent to the eastern boundary line of the Glacier Peak Wilderness area which contains 576,865 acres.

B. Distance from Population Centers

The area is within two to four hours driving time from population centers such as Seattle-Tacoma, Yakima, Tri-Cities, and Wenatchee.

C. Need for Ecosystem Representation

There are no special or unique ecosystems within the area which need representation through wilderness classification.

D. Interest by Proponents, Including Congressional

Since the passage of the Washington State Wilderness Act of 1984, Congress has not expressed interest in making further additions to the State wilderness system. Environmental organizations have expressed interest in adding portions of the area to the National Wilderness Preservation System in the future.

Both environmental and ORV organizations have advocated maintaining roadless status for the area.

E. Public Input

Public input during the RARE II and other planning efforts has supported unroaded allocations. Response is noted under the General portion of this Appendix.

F. Other Public Involvement

Public input solicited during the formulation of alternatives for this plan indicated much support for dispersed, unroaded recreation use for the area. Opinion differs as to the allocation for motorized versus non-motorized use.

V. ENVIRONMENTAL CONSEQUENCES

A. Environmental Consequences Associated with the Alternatives

1. Recreation

a. Significant Effects

All alternatives class much of the area as Dispersed Recreation Non-Motorized. No alternative allocates any land to Dispersed Recreation Motorized. There are presently about 10 miles of trail within the area.

There is not a large variation in land allocations between alternatives. Alternatives B, D and J allocate the most area to General Forest, with less emphasis on retaining visual qualities and the recreation setting. Alternatives E and F provide the greatest retention of present resource conditions with nearly total allocation of the area to unroaded non-motorized recreation. Alternative A/NFMA, C, G, H and I provide a balanced allocation with more than 60% of the retained in unroaded condition.

Under Alternatives C and I the portion of the trail system that is in this roadless area is allocated as follows:

Trail Name	Trail Number	Unroaded Non-Motorized	Unroaded Motorized	Roaded Motorized
Dirty Face	1500	2.5	--	2.0
Twin Lakes	1503	0.8	--	--
Phelps Creek	1511	--	2.6	--
Schaefer Lake	1519	--	--	4.0
Totals		3.3	2.6	6.0

b. Summary

The following tables indicate, by alternative, the degree to which this area will be allocated to roadless management and, of the roadless management acres, what percent is motorized and non-motorized. (These represent the Semi-primitive Motorized and Semi-primitive Non-Motorized Recreation Opportunity Spectrum (ROS) Classes. The area being allocated to roaded types of management activities will become Roaded Natural or Roaded Modified ROS opportunities depending on the intensity of development.)

Percent of the Area Having Unroaded Allocation

Alternative	A/NFMA	B	C Preferred	D	E	F	G	H	I	J
	62	61	65	61	100	97	66	62	65	61

Percent of the Unroaded Allocation Area
In Terms of Motorized/Non-Motorized Recreation

Alternative	A/NFMA	B	C Preferred	D	E	F	G	H	I	J
	0/100	0/100	0/100	0/100	1/99	1/99	0/100	0/100	0/100	0/100

The area being allocated to roaded management activities will have increased dispersed roaded recreation opportunities and the possible opening of access to potential developed recreation sites. The trail miles within the area allocated to roading will provide a less semi-primitive recreation experience, with more area taking on Roaded natural appearing or Roaded Modified recreation setting.

2. Wild, Scenic, and Recreational Rivers

A portion of the following river corridors (one-quarter mile each side of the river) are located within this roadless area and are recommended for designation in Alternatives C and I:

<u>River</u>	<u>Recommended Classification</u>	
Chiwawa	Segment 2	Recreational
White River	Segment 2	Scenic
	Segment 3	Recreational

More information concerning this recommendation can be found in Chapter III and Chapter IV.

3. Cultural Resources

Consideration of cultural resource values are required by a special set of historic preservation laws, regulations and policies. Particular efforts will

be made in every alternative to inventory, evaluate, and provide for significant cultural resources in areas where Forest management activities are planned.

4. Scenery

Alternatives A/NFMA and H will allocate the Chiwawa drainage side, and the upper end of the White River drainage, to Retention VQO. The middleground view as seen from the White River and Lake Wenatchee will be allocated to Partial Retention VQO. The Dirtyface Peak, lake, and surrounding area including the Meadow Creek Basin will be allocated to General Forest or Maximum Modification VQO.

Alternatives B, D and J will allocate the upper one-half of the drainage to Retention VQO. The lower one-half of the area will be allocated to Maximum Modification VQO. The area will be highly visible from the Chiwawa viewshed. The timbered portion of the landscape will be heavily altered.

Alternatives C and I will allocate the White River viewshed to a Retention VQO. Most of the area will be natural appearing. A small portion along the upper end of the Meadow Creek drainage will be allocated to General Forest or Maximum Modification VQO.

Alternatives E and F allocate all of the area to a Retention VQO. The natural appearing landscape will dominate the entire area. A cultural resource trail, Scenic River allocation, Scenic Travel prescription, Special Interest Area, and some old-growth management will all be Retention VQO.

Alternative G allocates many areas to Retention VQO. The Dirty Face Lake area and adjacent area will be allocated to Maximum Modification VQO.

The following table summarizes the Scenic component of this area by alternative in acres of Visual Quality Objective (VQO).

VQO	A/NFMA	B	Alternative							
			C PREFERRED	D	E	F	G	H	I	J
Preservation	--	--	--	--	--	--	--	--	--	--
Retention	16,494	14,416	17,024	14,416	22,048	22,048	19,779	16,494	17,024	14,395
Partial Retention	2,162	1,314	3,519	1,314	--	--	764	2,162	3,519	1,315
Modification	--	--	--	--	--	--	--	--	--	--
Maximum Modification	3,392	6,318	1,505	6,318	--	--	1,505	3,392	1,505	6,338
Total Acres	22,048	22,048	22,048	22,048	22,048	22,048	22,048	22,048	22,048	22,408

Preservation indicates that only natural, ecological changes will occur.

Retention indicates an essentially natural appearing landscape will be present.

Partial Retention indicates the landscape will be slightly altered.

Modification indicates a moderately altered landscape will be present.

Maximum Modification indicates a heavily altered landscape may be present.

5. Wildlife

Alternatives A/NFMA and H would have almost one-half the impact on wildlife than Alternatives B, D and J due to the amount of land allocated to General Forest. Alternative B, D and J would road 39 percent of the area and allow for timber harvest on 29 percent of the area. Alternatives C, F, and I would have an insignificant effect on wildlife. Alternative E would have no effect on wildlife, and Alternative G would have about one-fourth the impact as Alternatives B and D.

6. Fisheries

a. Significant Effects

In all alternatives, the small land area surrounding the Napeequa River would remain unroaded.

In all alternatives except E and F, at least portions of the area surrounding Raging and Schaefer Creeks could be roaded and timber harvested. Even with roading and timber harvest, impacts on the fisheries should be very minor since the creeks are high gradient and have very little fisheries value.

b. Mitigation Measures

In the alternatives that could road presently unroaded areas along Schaefer and Raging Creeks, the riparian protection zone prescription, the Wenatchee National Forest's Best Management Practices, and all standards and guidelines common throughout riparian areas of the Forest would be applied in stream zones. This treatment should adequately protect the streams from a reduction in fish habitat capability.

If the areas are roaded, road closures could be implemented to reduce the impact of enhanced access on the native fish populations.

7a. Vegetation: Trees

Under all alternatives it is expected that more area will remain unroaded than is roaded. The range of tree management activities is from 6,339 acres (29 percent) scheduled for timber emphasis in Alternative J to no scheduled harvest in Alternative E.

Alternatives A/NFMA and H has 3,392 acres (15 percent) timber emphasis and an additional 4,515 acres of vegetation manipulation with other resource emphasis planned.

Alternatives C and I have identical acre allocations. Both have 1,505 acres of timber emphasis, or 7 percent of the area. An additional 5,470 acres would be managed for other resource values that permit vegetative manipulation through timber sales. The primary difference between Alternatives C and I is the rate of harvest. Under Alternative I, more harvest activity would be scheduled in the first five decades.

Alternative F does not allocate any acres to timber emphasis. However, it does anticipate vegetative manipulation through timber sales on 742 acres or 3 percent of the area.

Alternative G has 1,505 acres allocated to timber emphasis and an additional 5,299 acres allocated to vegetation manipulation with other resource emphasis planned.

7b. Vegetation: Forage

Alternatives C, H, and I, with the proposed vegetative manipulation and improved access, will contribute adequate forage to the base needed for big game and livestock. Alternatives A/NFMA, B, D and J will provide forage in excess of projected needs. Alternatives E, F, and G which have little or no vegetative manipulation proposed, will not provide adequate forage to meet the projected needs for livestock, particularly in the fourth and fifth decade. Prescribed fire in the remaining unroaded portion of this area could offset the loss of forage for big game due to ecological succession.

8. Soil and Water

a. Significant Effects

The environmental consequences of allocating the Twin Lakes area to General Forest or Roadless Management are discussed by alternative below. No significant soil and water consequences are associated with Alternative E because soil and water disturbing activities occurring would be minimal. Up to three percent of the area could be allocated to timber harvest and road building in Alternative F, therefore, minimal soil and water consequences would occur. Alternatives A/NFMA, B, C, D, G, H, I and J allocate up to 39 percent of the area to timber harvest and road building. The environmental effects of timber harvest and road building are discussed in Chapter IV - Soil and Water sections.

The risk of degrading the soil and water resource increases with more timber harvest and road building. Alternatives A/NFMA, B, D, G, and H pose more risk of degrading the soil and water resource than Alternatives C and I due to more intensive management. However, since Wenatchee National Forest Best Management Practices and Forest Plan Standards and Guidelines will be employed, no unique soil and water effects are expected to occur because of forest management in this area.

b. Mitigation Measures

The mitigation measures that will be used in this area are the same as those discussed in Chapter IV - Soil and Water sections.

9. Air

Any additional prescribed burning generated in the Twin Lakes roadless area as a result of the alternatives would not have a significant effect on air quality beyond the impacts discussed in Chapter IV.

The close proximity to the Glacier Peak Wilderness Area would increase the risk of a smoke intrusion into the Class I area from timber harvest activities in Alternatives A/NFMA, B, C, D, G, H, I and J.

10. Minerals

Even though an area along the Chiwawa River is encumbered by 32 lode claims and 4 placer claims, the Twin Lakes area has no reported occurrences of locatable mineral commodities of a significant nature. Portions of the area are classified prospectively valuable for coal and geothermal resources, but only a small area has been leased and that was for oil and gas. Considering available information, the area does appear to have a relatively low potential for the occurrence of mineral resources. Therefore, the consequences on mineral resources do not appear to be extremely significant nor do they vary appreciably by alternative. However, the management prescriptions under which the area would be managed in each alternative would restrict mineral activities to varying degrees (i.e., special stipulations in leases and in approved operating plans).

The effects of these restrictions cannot be quantified, but the negative influence they would have on interest in conducting exploration activities within the area does vary by alternative and will, therefore, affect the potential for discovering and/or developing any unknown mineral resources of the area. This relative variation between alternatives is depicted on the following table.

Consequences on Mineral Resources

Restrictive Nature of Management Prescriptions	Acres Restricted by Management Prescriptions										
	A/NFMA	B	Alternative								
			C PREFERRED	D	E	F	G	H	I	J	
Withdrawn from Mineral Entry (valid existing rights will be determined and recognized)	0	0	0	0	0	0	0	0	0	0	0
Highly Restrictive	15,519	14,184	16,431	14,184	22,048	21,666	16,579	15,519	16,431	14,183	
Moderately Restrictive	3,137	1,546	4,112	1,546	0	382	3,964	3,137	4,112	1,526	
Relatively Few Restrictions	3,392	6,318	1,505	6,318	0	0	1,505	3,392	1,505	6,339	

miles of local roads shown below for each alternative are those that are expected to be constructed to permit timber harvest. They are included in the totals for the various alternatives shown in Chapter IV of the FEIS. It is assumed that the bulk of these roads will be constructed within the next 20 years. An analysis of the road development in unroaded areas during the past ten years indicates that for every acre harvested approximately 5.5 acres are accessed. It is assumed that 50 percent of these roads will be closed to public traffic, and that the remainder will be suitable for travel by high clearance vehicles only.

These mileages are estimates based upon typical road densities necessary to harvest timber on different slope classes. The actual road miles that will result from the implementation of the various alternatives will be determined during project planning, design, and environmental analysis. The assumptions made for this analysis will be monitored. The construction of any road will be subject to the appropriate environmental analysis.

That analysis will address the effects on resources that are dependent upon a roadless setting, including any adjacent roadless area or wilderness. The decision to close any road will be made on a case by case basis, according to the Forest Road Closure Policy found in the Forest-wide Standards and Guidelines.

	<u>Alternative</u>									
	A/NFMA	B	C	D	E	F	G	H	I	J
Miles	14	24	21	24	0	2	21	14	21	24

12. Fire

The fire management workload generated in the Twin Lakes roadless area as a result of the alternatives will not have a significant effect beyond the effects already described in Chapter IV.

A slight decrease in risk of industrial related fires would occur in the area as a result of little timber harvest in Alternatives E and F. Overall risk of fire will not significantly vary between Alternatives A/NFMA, B, C, D, G, H, I, or J. The cost efficiency of fire suppression activities would be slightly decreased in Alternatives E and F due to limited access by ground based suppression resources. All other alternatives will vary little in cost efficiency.

The impacts generated by slash disposal activities are discussed in Chapter IV.

13. Social/Economic

To measure this area in terms of its social value, a basic assumption is being made. This is, that because of the expressed interest in keeping as much of the inventoried roadless areas as possible in an unroaded condition, the more that condition is reflected, the higher the social value.

This condition is reflected for each alternative in the summary chart under item 1, Recreation, at the beginning of this section (Section V), which indicates the acres of unroaded management.

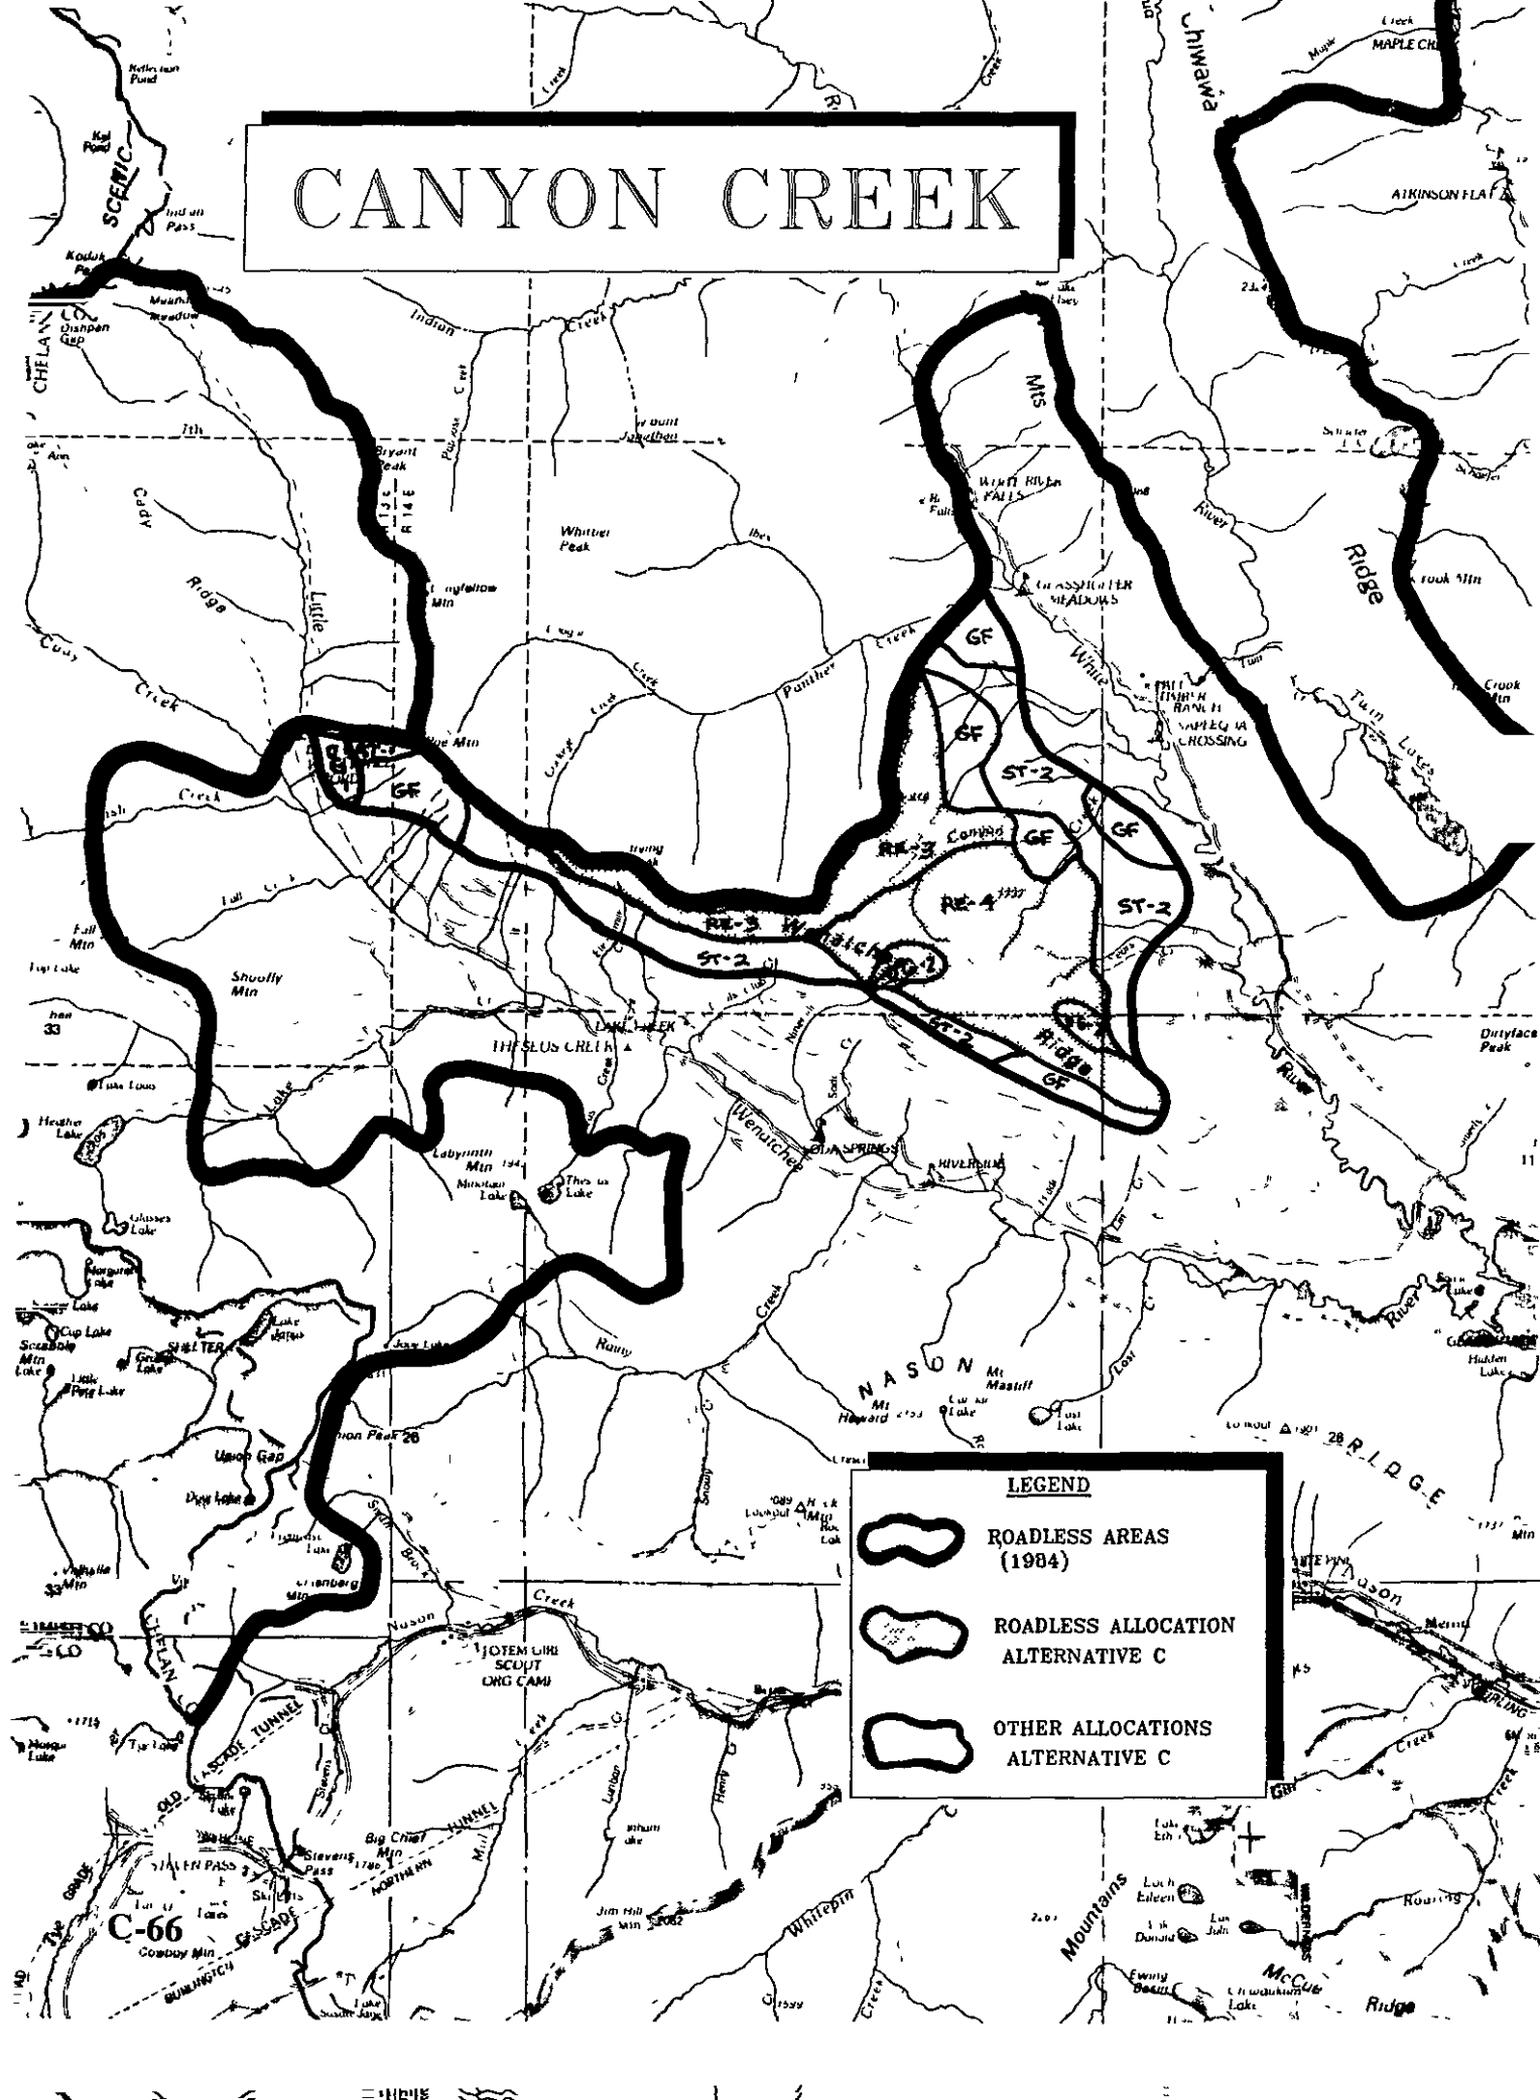

Also, as there is varying opinion as to the mode of transportation allowed, individuals must judge for themselves which alternative best meets that aspect of the social setting. There is also a summary table reflecting this condition for each alternative as referenced above which indicates the amount of motorized versus non-motorized use within the unroaded allocation.

A general measure of timber-oriented economic impacts can be made using the same table referenced above showing the amount of unroaded allocation. The larger the unroaded area, the greater the impact on timber-oriented jobs. If all of the estimated long-term sustained yield per year for this area were available, it would support 38.3 jobs.

14. Wilderness Potential

The roadless area does have potential as wilderness. It is large enough to be a separate unit; however, it would make a more logical addition to the Glacier Peak Wilderness. Under Alternatives A/NFMA, B, C, D, G, H, I, and J, a similar percentage of the area is allocated to roaded allocations. Alternatives B, D, and J prescribe the greatest acreage allocated to General Forest with 29 percent of the area. Alternatives E and F provide the greatest retention of wilderness attributes with all, or nearly all, of the area prescribed unroaded. Alternatives A/NFMA, C, H, and I provide a more even allocation with slightly more General Forest allocated in A/NFMA and H. General Forest allocation results in highest degree of road construction, timber management, and alteration of wilderness characteristics.

CANYON CREEK

LEGEND

-  ROADLESS AREAS (1984)
-  ROADLESS ALLOCATION ALTERNATIVE C
-  OTHER ALLOCATIONS ALTERNATIVE C

CANYON CREEK ROADLESS AREA

Size: Gross Acres: 9,158

Net Acres: 9,158

I. GENERAL INFORMATION

A. History

The area was inventoried and studied under RARE II and was recommended as non-wilderness. None of the area became wilderness under the Washington State Wilderness Act of 1984.

B. Location and Access

The area is located adjacent to the Glacier Peak Wilderness in Chelan County on the Lake Wenatchee Ranger District. It lies between the Little Wenatchee and White Rivers. Major access is via the White River, Sears Creek, Little Wenatchee, and Devil's Club roads, and a trail which ends on Irving Peak.

C. Physiography and Soils

This area occurs in both the White River and the Little Wenatchee River basins. Both valleys are wide and deep and were glacially carved so have many glacial features, particularly along the lower slopes. The ridgetops have not been glaciated so are characterized by rough and broken topography. In some places, snow chutes (avalanche paths) are very distinct and common.

Elevations range from 2,500 to 5,000 feet. About 50 percent of the soils have formed in granitic residuum, another 40 percent in volcanic ash and pumice, and the remainder have formed in glacial till or basaltic materials. The granitic soils have a high bearing strength (load capacity); they usually are not slippery or sticky when wet. The ash soils are very dusty when dry, and they tend to erode very easily if water is allowed to concentrate and run downhill over a bare surface.

There are a few deposits of glacial till and also some soils that have formed in basaltic residuum. The basaltic soils tend to become slippery and sticky when wet and are easily compacted. The glacial till soils tend not to be sticky or slippery when wet and they are more resistant to soil compaction.

D. Climate

Annual precipitation ranges from 70 to 100 inches per year, mostly as snow.

E. Vegetation

This area is 41 percent tentatively suitable timberland. It is all classed as wet ecotype. Douglas-fir, western hemlock, western red cedar and Pacific silver fir are the dominant species. Plantations of Douglas-fir in both Sears Creek and Rainy Creek show excellent growth and some stands will be ready for commercial thinning in the near future. Growth rates of an inch of diameter in six years is not uncommon in managed plantations adjacent to this area.

Wet areas originally occupied by western red cedar, and avalanche debris areas that have been logged, are difficult to reforest. Vine maple, sedges, fireweed, huckleberries, and creeping blackberries invade cutover areas. Beach cottonwood also grows vigorously in wet areas following logging.

F. Current Uses

The current use is for dispersed recreation. The major activities and their estimated annual use are as follows:

<u>Activity</u>	<u>Estimated Annual Recreation Visitor Days</u>
Hunting	200
Rock Hounding	Minor use

The area contains the following kinds and amounts of recreation opportunity spectrum (ROS) classes:

<u>ROS Class</u>	<u>Acres</u>
Semi-primitive Non-Motorized (SPNM)	9,158

There is only one mile of trail within the area and it is currently not open to motorized use.

G. Appearance and Surroundings

The area has high variety in landforms, and rockforms, moderate vegetative variety and low variety of waterforms (lakes and streams).

The area is highly textured mostly on the north slope and more broken and open on the south. The vegetation is on steep sided drainage bottoms and there is a broad but rugged ridgetop that is open, and broken.

The area is primarily viewed as middleground from the Little Wenatchee and White River valleys and Lake Wenatchee.

H. Attractions

Main attractions are Wenatchee Ridge, Sears, and Canyon Creek. Occasional use by rock hounds is attracted to the area by soapstone and actinolite crystals found in the area.

II. CAPABILITY-WILDERNESS CHARACTERISTICS

A. Manageability and Boundaries

The area is surrounded by the Glacier Peak Wilderness and by timber harvest and roads in the Little Wenatchee drainage. On the east it is surrounded by timber harvest and roads on the Wenatchee Ridge, as well as clearcuts and roads in the White River drainage.

The current boundaries do not follow any identifiable geographical features and therefore would be difficult to manage.

B. Natural Integrity

The impacts of human activity within the area are few and minor. What does exist is very minor. There is only one developed trail of about one mile. Two other old trails have not been maintained for many years and are almost entirely indistinguishable. A hunter's route exists for a couple of miles on top of Little Wenatchee Ridge.

C. Natural Appearance

The area has a natural, undisturbed appearance.

D. Opportunities for Solitude

A semblance of solitude could be obtained in the center of the area. Along the edges a person would probably be alone but the sight and sounds of human activity would preclude a real feeling of solitude. The lack of developed trails and the presence of heavy brush precludes much recreational use. There are very few visitor days use within the area. Few other people are or will be encountered except perhaps by hunters who venture more than a few hundred feet off the roads.

E. Opportunities for Primitive Recreation

With only one mile of developed trail there is not much opportunity. The area contains little attraction to draw much use. The old Sears Creek and Canyon Creek trails have not been maintained for years and thus are not used. Even when they were maintained they received virtually no use by general public. *There is one area, a ridge, which contains good representation of actinolite crystals but because of no road access, crystal hunters rarely go there.*

F. Challenging Experiences

Challenge would be afforded off the existing trail for cross country travel or orienteering.

G. Special Wildlife Features

There have been sightings of peregrine falcon reported but no nesting sites have been located. No other threatened or endangered species have been located in the area. The extent of sensitive species use in the area is unknown.

H. Historical and Scientific Study

There are no special or unique opportunities for outdoor education and scientific or historic study in the area which cannot already be found in the existing wilderness on the Forest.

III. RESOURCES AND POTENTIALS

A. Recreation

The area has potential value for unroaded types of recreation activities.

Estimated carrying capacity by ROS class is as follows:

<u>ROS Class</u>	<u>Capacity in Potential Recreation Visitor Days Per Year</u>
Semi-Primitive Non-Motorized (SPNM)	9,200

B. Wildlife

There is mountain goat habitat located in the Wenatchee Ridge vicinity. The area is summer habitat for a small mule deer herd.

C. Fish

Canyon Creek and Sears Creek are the only fish containing streams in this roadless area. Neither produce more than a few small fish. Ninemile and Elevenmile Creeks are also in this area, but are too steep to afford fish habitat.

D. Water

There are no water related encumbrances or planned activities within the area.

E. Livestock

There are no inventoried allotments within this roadless area. Wildfire has created some transitory forage in upper Canyon Creek, but due to topography, sensitive soils, and lack of access to adjacent forage areas, the potential for either recreation or domestic stock use is limited.

F. Timber

The area contains 3,795 acres of tentatively suitable Forest land. Stand, volume, and other data are as follows:

<u>Ecotype</u>	<u>Stand Size</u>	<u>Acres</u>	<u>Estimated Standing Volume (MMBF)</u>	<u>(MMCF)</u>
Wet	Mature	1,484	42.1	7.7
Wet	Immature	2,247	40.4	7.4
Dry	Mature	64	.8	1
		Total 3,795	83.3	15.2

The estimated maximum biological potential contribution to the long-term sustained yield is 1.5 MMBF (0.28 MMCF) per year.

G. Minerals

This area is underlain by pre-Tertiary and pre-Jurassic metamorphics. The area lying adjacent and to the north was investigated by the U.S.G.S. and U.S. Bureau of Mines. As part of that investigation they took some samples within the subject area. As a result of their investigation, they have not identified the area as having any known mineral potential of significance. The only minerals of economic interest in the area are possibly feldspar and limestone, however, most interest appears to be concentrated to the south and east of the subject area. According to Bureau of Land Management records (1/23/85), 30 lode claims have been located along the Wenatchee Ridge in the southeast part of the area where the feldspar deposits appear to be located. Ten of these claims were located in 1984 while the other 20 have been maintained by annual assessment work. Except for a small area around the Little Wenatchee Ford which is classified prospectively valuable for geothermal resources, the area is not classified "prospectively valuable" for leasable commodities. There are no existing leases or pending lease applications.

H. Cultural-Historical

The only recorded historic use of the Canyon Creek unit was the Poe Mountain fire lookout, in existence between 1933 and approximately 1970. Although the Little Wenatchee served as a cross-Cascade route to early Indians and later exploring expeditions (in 1860, the E.F. Cady party for whom Cady Pass and Creek were named; D.C. Linsley, with the Northern Pacific Railroad surveys in 1870; and A.B. Rogers, with Great Northern Railroad in 1887), travel was directed to the main river corridor rather than across the rugged slopes to the north. There may have been some use by fur trappers--cabin remnants are reported in the upper reaches of the Little Wenatchee. However, because of the transitory pattern of use within and adjacent to the Canyon Creek Unit, there is not a high potential for the occurrence of significant cultural sites.

I. Land Use

There are no special land uses within the area.

J. Fire

Annual fire occurrence is low to moderate with most started by lightning. Fuel loadings are moderate to heavy at lower elevations, with scattered accumulations in alpine meadows at higher elevations. Periodic large fires have occurred.

K. Insects and Disease

Heavy mortality to western white pine has left a grey snag area on the ridge between Rainy Creek and Sears Creek. Investigations for timber sales to salvage this area in 1977 found the trees too blue stained and weather checked to be of commercial sawlog value. As these trees begin to fall over, fire potential will be extreme in this area.

Future sales in or immediately adjacent to this area are planned to remove decadent old-growth timber and stands with high risk of future insect losses.

L. Private Lands

There are no private lands within the area.

IV. NEED

A. Nearby Wilderness and Other Roadless Areas

This area is located immediately adjacent to the boundary of the 576,865 acre Glacier Peak Wilderness Area and less than one mile south of the Twin Lakes roadless area.

B. Distance from Population Centers

The area is within two to four hours driving time from population centers such as Seattle-Tacoma, Yakima, Tri-Cities, and Wenatchee.

C. Need for Ecosystem Representation

There are no special or unique ecosystems within the area which need of representation through wilderness classification.

D. Interest by Proponents, Including Congressional

Since the passage of the Washington State Wilderness Act of 1984, Congress has not expressed interest in making further additions to the State wilderness system. Environmental organizations have expressed interest in adding portions of the area to the National Wilderness Preservation System in the future.

Both environmental and ORV organizations have advocated maintaining roadless status for the area.

E. Public Input

Public input during the RARE II and other planning efforts was obtained and this input supported unroaded allocations. The response is covered under the General portion of this appendix.

F. Other Public Involvement

Public input solicited during the formulation of alternatives for this plan indicated much support for dispersed, unroaded recreation use for the area. There are differing opinions as to whether the allocation should be for motorized or nonmotorized use.

The owners of the Tall Timbers Ranch expressed concern over timber sales in the area.

V. ENVIRONMENTAL CONSEQUENCES

A. Environmental Consequences Associated with the Alternatives

1. Recreation

a. Significant Effects

Only portions of two trails lie within this roadless area: Poe Mountain, three miles; and Irving Pass, one mile. The Poe Mountain Trail goes in and out of wilderness as it switchbacks up the ridge. Alternatives A/NFMA, C, and G would allocate areas along this trail to scenic travel and protect the trail corridor.

Alternatives B, D and J would allocate them to General Forest and could alter the trailside environment. Alternatives E and F would allocate these trails to Dispersed Recreation, Non-motorized. The trails are currently open to hikers and horses. Under Alternatives C and I, Poe Mountain would travel through unroaded non-motorized allocation and Irving Pass through roaded motorized.

b. Summary

The following tables indicate, by alternative, the degree to which this area will be allocated to roadless management and, of the roadless management acres, what percent is motorized and non-motorized. (These represent the Semi-primitive Motorized and Semi-primitive Non-Motorized Recreation Opportunity Spectrum (ROS) Classes. The area being allocated to roaded types of management activities will become Roaded Natural or Roaded Modified ROS opportunities depending on the intensity of development.)

Percent of the Area Having Unroaded Allocation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	0	45	46	46	100	97	49	0	46	46

Percent of the Unroaded Allocation Area
In Terms of Motorized/Non-Motorized Recreation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	0	0/100	62/38	0/100	0/100	0/100	0/100	0	62/38	0/100

The area being allocated to roaded management activities will have increased dispersed roaded recreation opportunities and the possible opening of access to potential developed recreation sites. The trail miles within the area allocated to roading will provide a less semi-primitive recreation experience with more area taking on a Roaded Natural or Roaded Modified recreation setting.

2. Wild, Scenic, and Recreational Rivers

A portion of the following river corridors (one-quarter mile each side of the river) is being located within this roadless area and is recommended for designation in Alternatives C and I:

<u>River</u>	<u>Recommended Classification</u>
White River	Segment 3 Recreational

More information concerning this recommendation can be found in Chapter III and Chapter IV.

3. Cultural Resources

Consideration of cultural resource values are required by a special set of historic preservation laws, regulations and policies. Particular efforts will be made in every alternative to inventory, evaluate, and provide for significant cultural resources in areas where Forest management activities are planned.

4. Scenery

Alternatives A/NFMA and H will allocate the middleground of both the Little Wenatchee viewshed and most of the White River viewsheds in Partial Retention VQO. Approximately one-third of the Canyon Creek area will be allocated to Maximum Modification VQO. These areas are from the bottom to the upper end of the drainage. From the White River viewshed, recreationists will see areas of heavily altered landscape.

Alternatives B, D and J will allocate about one-half of the areas to Maximum Modification VQO. The lower one-half of the drainage to the wilderness boundary will be heavily modified. The upper ridgetop of the Wenatchee Ridge will be allocated to Retention VQO. The Little Wenatchee and the White River viewsheds will be heavily altered as viewed from the recreation travel routes.

Alternatives C and I will allocate mostly to Retention and Partial Retention VQO. Glimpses of the middleground area from the Little Wenatchee and White River viewsheds will be General Forest or Maximum Modification VQO.

Alternatives E and F will allocate all areas to Retention VQO. All of the area will be in a natural appearing condition.

Alternative G allocates most areas to Retention and Partial Retention VQO. Some General Forest allocation will heavily alter the middleground of Canyon Creek Area and the lower end of the midslopes. Most middleground views from the White River and the Little Wenatchee viewsheds will be allocated to Partial Retention VQO.

The following table summarizes the Scenic component of this area by alternative in acres of Visual Quality Objective (VQO).

VQO	A/NFMA	B	Alternative							
			C PREFERRED	D	E	F	G	H	I	J
Preservation	--	--	--	--	--	--	--	--	--	--
Retention	1,293	4,749	2,373	4,749	9,158	9,158	5,406	1,293	2,373	4,728
Partial Retention	3,795	127	2,438	127	--	--	2,840	3,795	2,438	127
Modification	--	--	2,587	--	--	--	--	--	2,587	--
Maximum Modification	4,070	4,282	1,760	4,282	--	--	912	4,070	1,760	4,303
Total Acres	9,158	9,158	9,158	9,158	9,158	9,158	9,158	9,158	9,158	9,158

Preservation indicates that only natural, ecological changes will occur.

Retention indicates an essentially natural appearing landscape will be present.

Partial Retention indicates the landscape will be slightly altered.

Modification indicates a moderately altered landscape will be present.

Maximum Modification indicates a heavily altered landscape may be present.

5. Wildlife

Alternatives A/NFMA and H would have the most impact on wildlife and habitat due to the roading of the entire area. Alternatives A/NFMA and H would road the entire area and allow harvest on 44 percent of the area. Alternatives B, D and J would only road 54 percent of the area; therefore, Alternatives B, D and J would have less of an overall impact than A/NFMA and H. Alternatives C and I would have about one-third the impact on wildlife as Alternatives A/NFMA and H. Alternative E would have no effect on wildlife in this area, and Alternative F would have an insignificant effect. Alternative G would have less than one-fifth the impact of Alternatives A/NFMA and H.

6. Fisheries

a. Significant Effects

In Alternatives E and F, the vicinity of Canyon and Sears Creeks would remain unroaded. In the other alternatives, the area of Sears Creek and the lower two miles of Canyon Creek could be roaded. In all the alternatives, except possibly Alternatives A/NFMA and H, the upper Canyon Creek area would remain unroaded. In those areas with potential timber harvest, in all alternatives, the vicinity of Canyon Creek would be managed with an intensive timber harvest regime. In all alternatives except Alternatives B, D and J, the vicinity of Sears Creek would be managed with an extended shelterwood prescription to maintain the visual objectives of the area. In Alternatives B, D and J the Sears Creek area could be managed with the intensive timber harvest regime.

Roading these areas could change the recreational fishing opportunities. Since about two-thirds of the Forest's fishing occurs in roaded areas, it is expected that fishing would increase. This would help to meet a portion of the fishing demand (see Chapter III on fish), but also could result in overfishing and reduction in both numbers and size of fish using the habitat. However, since the wild fisheries production is very low in these headwater systems, fishermen are unlikely to fish intensively here and overfishing effects should not occur.

It is also possible that roading the unroaded areas could result in environmental degradation to streams due to timber harvest and road construction in the basins (see Chapter IV, Environmental Consequences). Some of these possible effects are also addressed in the soil and water environmental effects.

b. Mitigation Measures

In the alternatives that could road presently unroaded areas along Canyon and Sears Creeks, the riparian protection zone prescription, the Wenatchee National Forest's Best Management Practices and all standards and guidelines common throughout riparian areas of the Forest would be applied in stream zones. This treatment should adequately protect the streams from a reduction in fish habitat capability.

If the areas are roaded, road closures could be implemented to reduce the impact of enhanced access on the native fish populations.

7a. Vegetation: Trees

Management direction under Alternatives A/NFMA and H does not preclude roading or vegetative manipulations through timber sales on any of this area. Timber emphasis is allocated on 4,070 acres or 44 percent of the area under this alternative. An additional 4,515 acres are zoned special resource management area where timber sales will be used to manipulate the existing vegetation.

All other alternatives allocate at least the ridgetop portion of this area to nonroaded recreation. Alternative E allocates the entire roadless area to unroaded non-motorized recreation where no timber sales are permitted. Alternative F is similar with 97 percent or 8,904 acres allocated to roadless recreation with no timber harvest.

Under Alternatives C and I the unroaded motorized recreation zone would be 4,876 acres or 46 percent of the area. The remaining 54 percent of the area would permit manipulation through timber sales. However, only 3,000 acres or 33 percent of the area, is suitable for timber harvest under these alternatives. Alternatives B, D and J would have timber sales proposed for 4,876 acres. However, most of the acres under Alternatives B, D and J would be timber emphasis acres. Under Alternative G, the largest block of vegetative manipulation acres would emphasize the scenic travel prescriptions.

7b. Vegetation: Forage

Alternatives C, H, and I, with the proposed vegetative manipulation and improved access, will contribute adequate forage to the base needed for big game and livestock. Alternatives A/NFMA, B, D and J will provide forage in excess of projected needs. Alternatives E, F, and G which have little or no vegetative manipulation proposed, will not provide adequate forage to meet the projected needs for livestock, particularly in the fourth and fifth decade. Prescribed fire in the remaining unroaded portion of this area could offset the loss of forage for big game due to ecological succession.

8. Soil and Water

a. Significant Effects

The environmental consequences of allocating the Canyon Creek area to General Forest or Roadless Management are discussed by alternative below. No significant soil and water consequences are associated with Alternative E because soil and water disturbing activities occurring would be minimal. Up to three percent of the area could be allocated to timber harvest and road building in Alternative F. Alternatives A/NFMA and H allocate all of the area to timber harvest and road building, while Alternatives B, C, D, G, I and J allocate up to 53 percent of the area to timber harvest and road building. The environmental effects of timber harvest and road building are discussed in Chapter IV - Soil and Water sections.

The risk of degrading the soil and water resource increases with more timber harvest and road building. Alternatives A/NFMA and H pose more risk of degrading the soil and water resource than Alternatives B, C, D, G, I and J due to more intensive management. However, since Wenatchee National Forest Best Management Practices and Forest Plan Standards and Guidelines will be employed, no unique soil and water effects are expected to occur because of forest management in this area.

b. Mitigation Measures

The mitigation measures that will be used in this area are the same as those discussed in Chapter IV - Soil and Water sections.

9. Air

Any additional prescribed burning generated in the Canyon Creek roadless area as a result of the alternatives would not have a significant effect on air quality beyond the impacts discussed in Chapter IV.

The close proximity to the Glacier Peak Wilderness Area would increase the risk of a smoke intrusion into the Class I area from timber harvest activities in Alternatives A/NFMA, B, C, D, G, H, I and J.

10. Mineral

Since this area appears to have a low potential for the occurrence of mineral resources, the consequences on mineral resources do not appear to be extremely significant nor do they appear to vary appreciably by alternative. However, the management prescriptions under which the area would be managed in each alternative would restrict mineral activities to varying degrees (i.e., special stipulations in leases and in approved operating plans). The effects of these restrictions cannot be quantified, but the negative influence they would have on interest in conducting exploration activities within the area does vary by alternative and will, therefore, affect the potential for discovering and/or developing any unknown mineral resources of the area. This relative variation between alternatives is depicted on the following table.

Consequences on Mineral Resources

Restrictive Nature of Management Prescriptions	Acres Restricted by Management Prescriptions									
	A/NFMA	B	C PREFERRED	D Alternative	E	F	G	H	I	J
Withdrawn from Mineral Entry (valid existing rights will be determined and recognized)	0	0	0	0	0	0	0	0	0	0
Highly Restrictive	445	4,282	6,770	4,282	9,158	8,946	4,791	445	6,770	4,282
Moderately Restrictive	4,643	594	628	594	0	212	3,455	4,643	628	573
Relatively Few Restrictions	4,070	4,282	1,760	4,282	0	0	912	4,070	1,760	4,303

11. Roads

The miles of local roads shown below for each alternative are those that are expected to be constructed to permit timber harvest. They are included in the totals for the various alternatives shown in Chapter IV of the FEIS. It is assumed that the bulk of these roads will be constructed within the next 20 years. An analysis of the road development in unroaded areas during the past ten years indicates that for every acre harvested approximately 5.5 acres are accessed. It is assumed that 50 percent of these roads will be closed to public traffic, and that the remainder will be suitable for travel by high clearance vehicles only.

These mileages are estimates based upon typical road densities necessary to harvest timber on different slope classes. The actual road miles that will result from the implementation of the various alternatives will be determined during project planning, design, and environmental analysis. The assumptions made for this analysis will be monitored. The construction of any road will be subject to the appropriate environmental analysis. That analysis will address the effects on resources that are dependent upon a roadless setting, including any adjacent roadless area or wilderness. The decision to close any road will be made on a case by case basis, according to the Forest Road Closure Policy found in the Forest-wide Standards and Guidelines.

	<u>Alternative</u>									
	A/NFMA	B	C	D	E	F	G	H	I	J
			PREFERRED							
Miles	15	11	11	11	0	1	11	15	11	11

12. Fire

The fire management workload generated in the Canyon Creek roadless area as a result of the alternatives will not have a significant effect beyond the effects already described in Chapter IV.

A slight decrease in risk of industrial related fires would occur in the area as a result of little timber harvest in Alternatives E and F. Overall risk of fire will not significantly vary between Alternatives A/NFMA, B, C, D, G, H, I or J. The cost efficiency of fire suppression activities would be slightly decreased in Alternatives E and F due to limited access by ground based suppression resources. All other alternatives will vary little in cost efficiency. The impacts generated by slash disposal activities are discussed in Chapter IV.

13. Social/Economic

To measure this area in terms of its social value, a basic assumption is being made. This is, that because of the expressed interest in keeping as much of the inventoried roadless areas as possible in an unroaded condition, the more that condition is reflected, the higher the social value.

This condition is reflected for each alternative in the summary chart under item 1, Recreation, at the beginning of this section (Section V), which indicates the acres of unroaded management.

Also, as there is varying opinion as to the mode of transportation allowed, individuals must judge for themselves which alternative best meets that aspect of the social setting. There is also a summary table reflecting this condition for each alternative as referenced above which indicates the amount of motorized versus non-motorized use within the unroaded allocation.

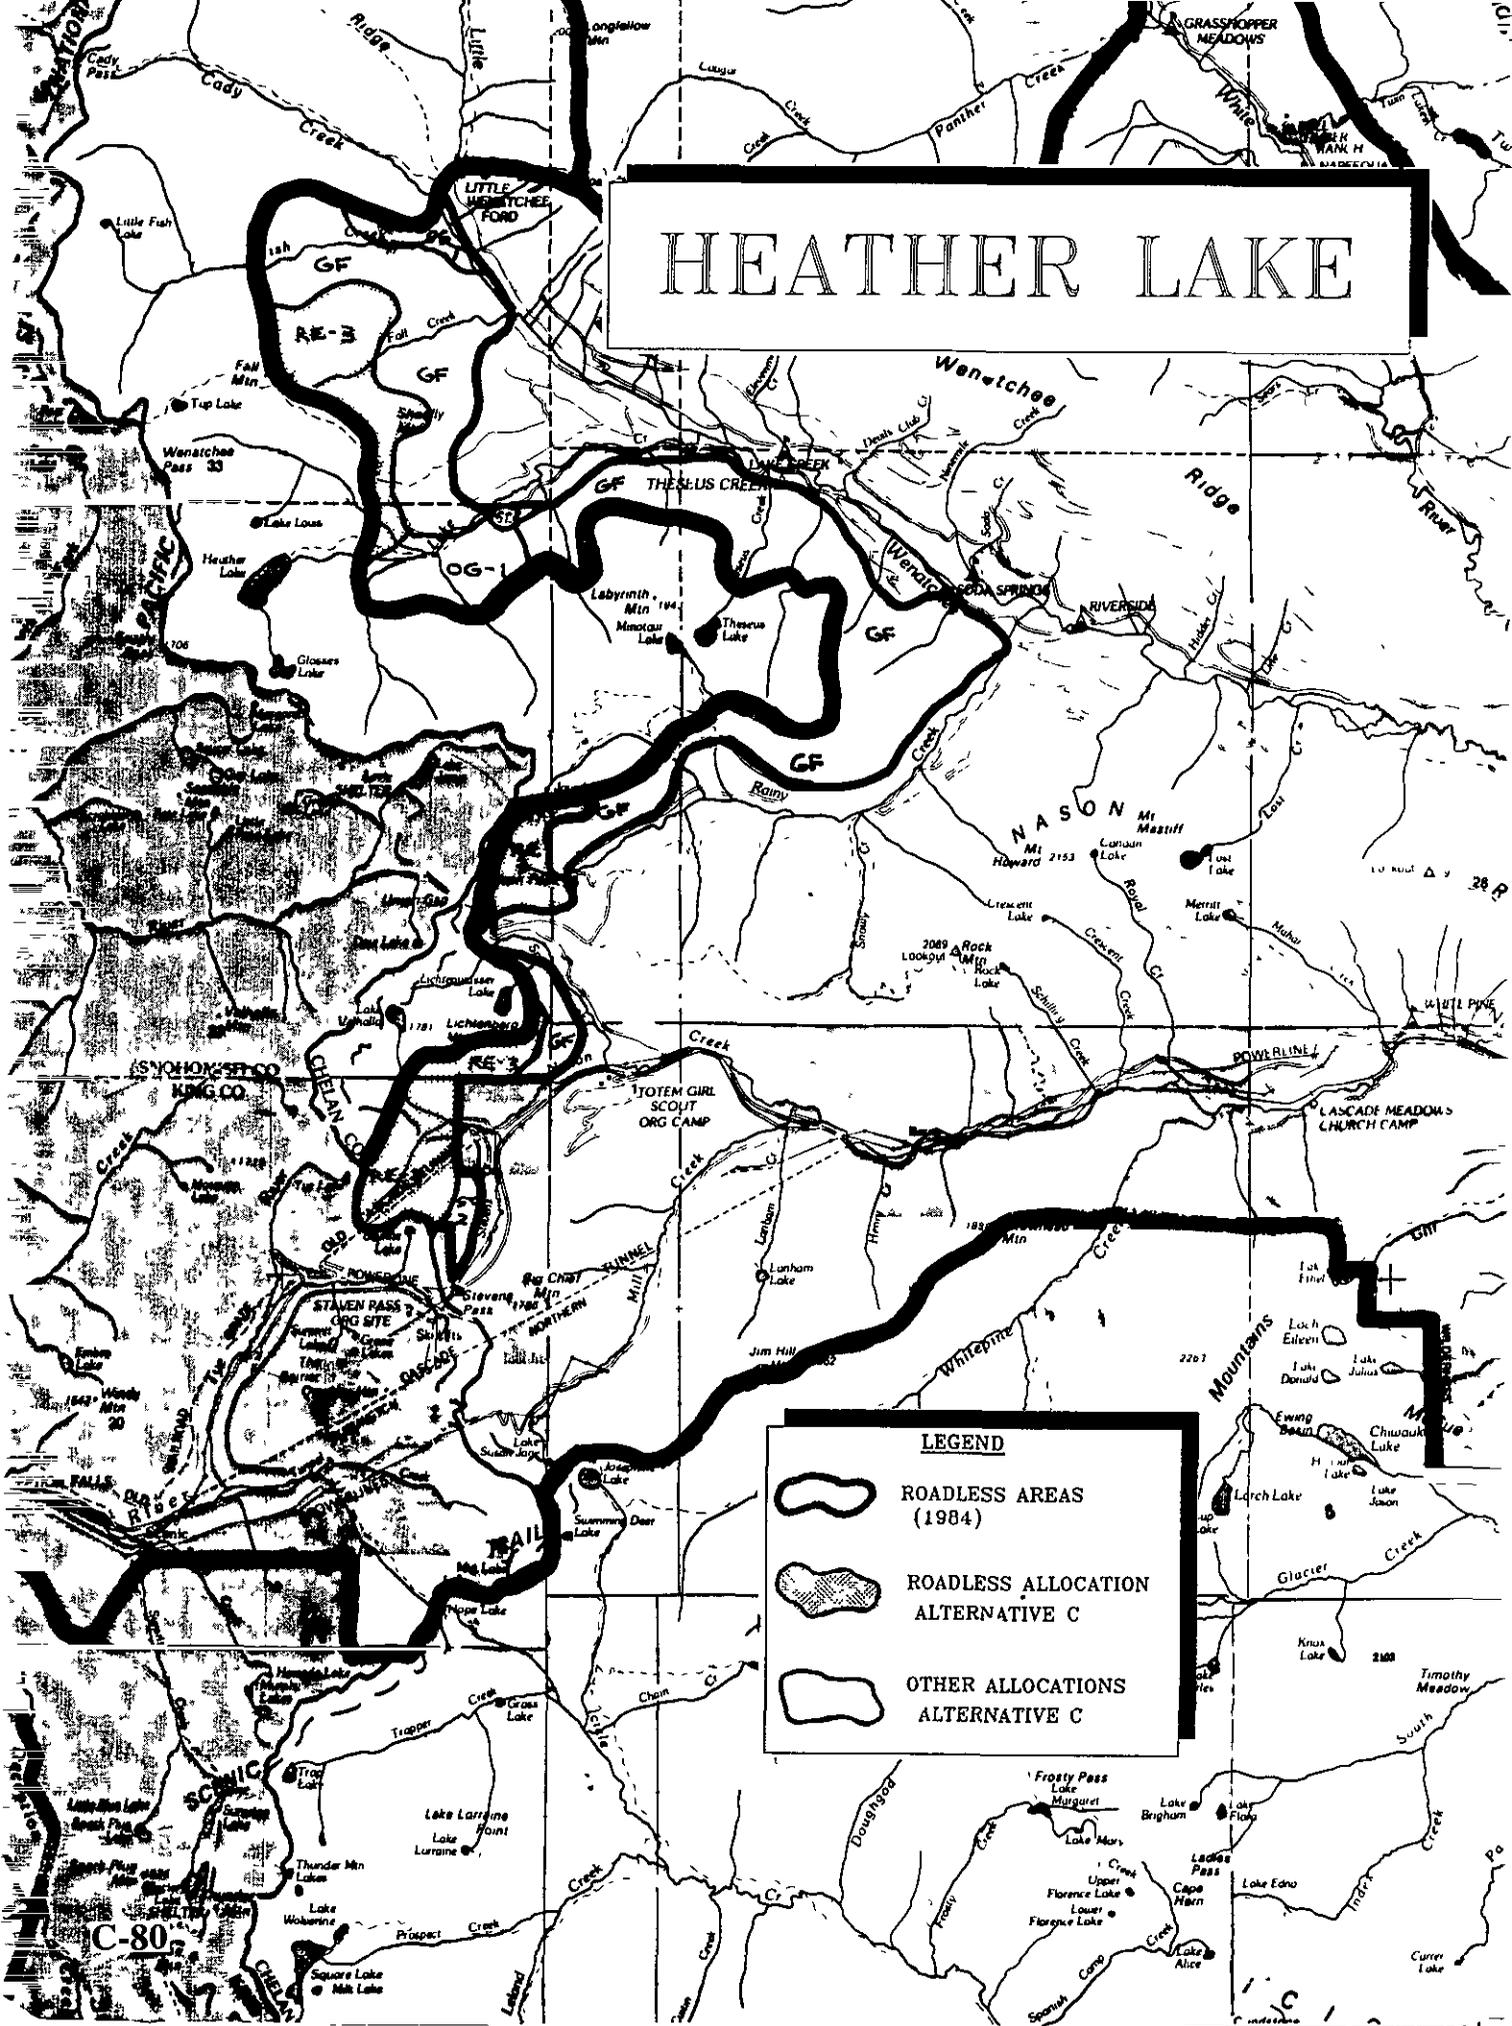

A general measure of timber-oriented economic impacts can be made using the same table referenced above showing the amount of unroaded allocation. The larger the unroaded area, the greater the impact on timber-oriented jobs. If all of the estimated long-term sustained yield per year for this area were available, it would support 18.8 jobs.

14. Wilderness Potential

The roadless area has potential as wilderness. It is too small of an area to be a separate unit of wilderness and is a more logical addition to the Glacier Peak Wilderness.

Alternatives A/NFMA and H provide for the least retention of wilderness values, with 44 percent prescribed as General Forest and none of the area retained as unroaded. Alternatives B, D, J, C, and I all allocate about 45 percent of the area as unroaded. Alternatives B, D, and J prescribe the largest area of General Forest at 48 percent. Alternatives E and F provide the least change with all or nearly all of the area retained in unroaded and natural condition.

HEATHER LAKE

LEGEND

-  ROADLESS AREAS (1984)
-  ROADLESS ALLOCATION ALTERNATIVE C
-  OTHER ALLOCATIONS ALTERNATIVE C

HEATHER LAKE ROADLESS AREA

Size: Gross Acres: 11,258

Net Acres: 11,067

I. GENERAL INFORMATION

A. History

This area was designated for unroaded recreation use under the multiple use plan. It was inventoried and evaluated in RARE II as part of area #B 6031 and recommended as nonwilderness. When reassessed as part of the Washington State Wilderness Act of 1984 proposal, 11,151 acres became part of the newly established Henry M. Jackson Wilderness.

B. Location and Access

The area is adjacent to the 102,700 acre Henry M. Jackson Wilderness in Chelan County on the Lake Wenatchee Ranger District.

Main access is via the Lake Creek and Rainy Creek - Smith Brook Roads and the Lake Creek and Top Lake Trails.

C. Physiography and Soils

The topography is rolling and smooth and very typical for a glaciated valley. The main part of the river basin (Little Wenatchee) is a wide, deep glaciated valley. The overstory vegetation in this unit consists mainly of large conifers. There are not very many open areas in this unit.

The soils are pretty evenly split between those that have developed in granitic residuum and those that have formed in volcanic ash and pumice materials. About three percent of the soils have formed in basaltic residuum. The granitic soils have good bearing strength and they do not become slippery or sticky when wet. Also, they are not easily displaced. The ash soils on the other hand are easily displaced, and they become very dusty when dry. Ash soils are easily eroded by running water if the surface is left bare. The basaltic soils tend to be slippery and sticky when wet, and they are easily compacted.

D. Climate

This roadless area experiences significant annual precipitation ranging from 90 to 150 inches annually. The mean elevation of this area would indicate that an estimated 75 percent of the annual precipitation falls as snow with depths over 200 inches not uncommon.

E. Vegetation

This area is 60 percent tentatively suitable commercial timberland. It is all classed as wet ecotype with overmature 400-500 year old cedar, hemlock, white pine, and Douglas-fir along the Lake Creek trails. This area is the approximate northern limit of natural noble fir in the Washington Cascades. Huckleberries, heather, false azalea, and devil's club characterize the shrub vegetation. Mountain hemlock, western hemlock, Pacific silver fir, and large Douglas-fir with volumes exceeding 80 M board feet per acre occur in areas proposed for harvest in the Fish and Fall Creek areas. Adjacent harvest units are well stocked with planted Douglas-fir as well as naturally seeded-in true firs and hemlock. Huckleberries and fireweed thrive in the cutover areas.

F. Current Uses

The current use is for dispersed recreation. The major activities and their estimated annual use are as follows:

<u>Activity</u>	<u>Estimated Annual Recreation Visitor Days</u>
Hunting	100
Hiking	500
Fishing	<u>100</u>
Total	700

The area contains the following kinds and amounts of Recreation Opportunity Spectrum (ROS) Classes.

<u>ROS Class</u>	<u>Acres</u>
Semi-primitive Nonmotorized	10,066

There is 1.0 mile of trail within the area and it is currently open to motorized use.

G. Appearance and Surroundings

The area is primarily viewed as middleground from the main Little Wenatchee road, and foreground from two short trails.

The area is steep and even textured with vegetation, with some rockforms and a few mountain tops such as Shoofly and Jove Mountain. Large old-growth vegetation along the foreground of Top and Heather Lakes provides high visual variety.

The Heather Lake area is surrounded by Glacier Peak Wilderness and the Little Wenatchee River and Rainy Creek valleys.

H. Attractions

The area has no major attraction features. The recreation activities stated above occur basically in Fish Creek, Lake Creek, and Theseus Creek respectively.

II. CAPABILITY-WILDERNESS CHARACTERISTICS

a. Manageability and Boundaries

The west boundary is adjacent to the Henry M. Jackson Wilderness area. The south boundary touches the Henry M. Jackson Wilderness and adjoins the Nason Ridge unit which is included in Alpine Lake Management Plan. The northern boundary traverses hillsides above the Little Wenatchee River.

Most of the boundaries do not follow clearly defined physical features.

B. Natural Integrity

The impact of human activity in the past is minor. Two developed trails (Heather Lake and Top Lake) cross the area as they access the Henry M. Jackson Wilderness. A fisherman route goes up Theseus Creek into the Henry M. Jackson Wilderness. There are no other signs of human activity in the area at present. There is a well developed road system on both the north and south sides and immediately adjacent to it. Extensive timber harvest has occurred along these road system.

C. Natural Appearance

The area is long and narrow and sandwiched between the Henry M. Jackson Wilderness and a well developed roaded area. There are few places within the area that a person would not be at least within sight or sound of human activity. Nearby roads and timber harvest activities can be seen from many locations.

D. Opportunities for Solitude

The size and shape of the area preclude a sense of real solitude. However, there are very few miles of trail and people will be confined to them. If a person had the objective of not seeing people, they could enter the area off the trails, and although being within sight and sound of developments they would not likely confront other individuals.

E. Opportunities for Primitive Recreation

With less than three miles of developed trail within the area, primitive recreation opportunities are not abundant.

F. Challenging Experiences

Trails that exist are well developed and of no particular challenge. Off the trails, steep slopes and heavy brush offer a challenge to only the most dedicated cross country hiker.

G. Special Wildlife Features

There have been sightings of peregrine falcon reported but no nesting sites have been located. No other threatened or endangered species have been located in the area. The extent of use by sensitive species in the area is unknown. Some spotted owls have been located within the area.

H. Historical and Scientific Study

There are no special or unique opportunities for outdoor education, and scientific or historic study in the area, which cannot already be found in the existing wilderness on the Forest.

III. RESOURCES AND POTENTIALS

A. Recreation

The area has potential value for unroaded types of recreation activities.

Estimated carrying capacity by ROS Class is as follows:

ROS Class Capacity in Potential Recreation Visitor Days Per Year

Semi-Primitive Non-Motorized 11,000

B. Wildlife

The area is summer habitat for a small mule deer herd. Black bear also inhabit the area.

C. Fish

In this area, Lake Creek, an outlet for Heather Lake, supports some resident trout. However, only one mile of this stream is within the roadless area.

Theseus and Fish Creeks fish populations are not known, but are thought to be insignificant. Fish are planted at the bridge crossing on the lower end of Theseus Creek. Fall Creek is too steep to be significant fish habitat.

D. Water

There are no water related encumbrances or planned activities within the area.

E. Livestock

This area is within portions of the Stevens Pass and Little Wenatchee Recreation Stock Allotments. Range resource inventory maps do not show any usable forage types inside this roadless area. Due to vegetative cover, topography and limited access, there is no stock allotment potential, neither recreation nor domestic.

F. Timber

The area contains 6,678 acres of tentatively suitable timberland. Stand, volume, and other data are as follows:

Ecotype	Stand Size	Acres	Estimated Standing Volume (MMBF)	(MMCF)
Dry	Mature	42	.5	.1
Wet	Mature	4,261	120.8	22.2
Wet	Immature	2,311	41.6	7.6
Wet	Seedling-Sapling	64	---	---
	Total	6,678	162.9	29.9

The estimated maximum biological potential contribution to the long-term sustained yield is 2.2 MMBF (0.4 MMCF) per year.

G. Minerals

This area is underlain by pre-Tertiary metamorphics. It has not been investigated by the U.S.G.S. or the U.S. Bureau of Mines, but reported mineral occurrences are limited to beryl. According to Bureau of Land Management records (1/23/84), there are no mining claims located within the subject area. The west half of the area is classified "prospectively valuable" for geothermal resources, but there are no existing mineral leases within the area, nor are there any pending lease applications. Low grade garnets can be found along parts of the Heather Lake trail.

H. Cultural-Historical

There are no recorded or reported historic uses of this area. The cultural resource sensitivity of this area is similar to the Canyon Creek unit in that the land base is fairly rugged. The area is also marginal to the main Little Wenatchee River corridor where much of the prehistoric and historic uses were centered.

I. Land Use

There are no special land uses within the area.

J. Fire

Annual fire occurrence is low to moderate with most started by lightning. Fuel loadings are moderate to heavy at lower elevations, with scattered accumulations in alpine meadows at higher elevations. Periodic large fires have occurred.

K. Insects and Disease

The primary losses in this area are old-age tree diseases including butt rot (*Polyporus schweinitzii*) and heart rot (*Fomes pini*). Large valuable white pine are lost to mountain pine beetle, but this species is a minor component of most of the stands in this area.

L. Private Lands

There are 191 acres of private land within the area with access being afforded from lands lying outside the area.

IV. NEED

A. Nearby Wilderness and Other Roadless Areas

The area is located immediately adjacent to the boundaries of the 103,591 acre Henry M. Jackson Wilderness area and the Nason Ridge roadless area which is located within the Alpine Lakes Management Area.

B. Distance From Population Centers

The area is within two to four hours driving time from population centers such as Seattle-Tacoma, Yakima, Tri-Cities, and Wenatchee.

C. Need for Ecosystem Representation

There are no special or unique ecosystems within the area which need representation through wilderness classification.

D. Interest by Proponents, Including Congressional

Since the passage of the Washington State Wilderness Act of 1984, Congress has not expressed interest in making further additions to the State wilderness system. Environmental organizations have expressed interest in adding portions of the area to the National Wilderness Preservation System in the future.

Both environmental and ORV organizations have advocated maintaining roadless status for the area.

E. Public Input

Public input during the RARE II and other planning efforts was obtained and supported unroaded allocations. Response is covered under the General portion of this Appendix.

F. Other Public Involvement

Public input solicited during the formulation of alternative for this plan indicated much support for dispersed, unroaded recreation use for the area.

There is a difference of opinion as to whether the allocation should be for motorized or non-motorized use.

V. ENVIRONMENTAL CONSEQUENCES

A. Environmental Consequences Associated with the Alternatives

1. Recreation

a. Significant Effects

In alternatives A/NFMA and H the area is allocate predominantly to development with 1,528 acres retained in unroaded recreation. Although 4,727 acres are to be managed in partial retention to scenic values.

Alternatives B, D and J allocate nearly all of the area to General Forest with 1,442 acres allocated to unroaded recreation, non-motorized.

Alternatives C and I call for little more even allocation between development and unroaded non-motorized Recreation.

Under Alternatives C and I the portion of the trail system in this roadless area is allocated as follows:

Trail Name	Trail Number	Unroaded Non-Motorized	Unroaded Motorized	Roaded Motorized
Top Lake	1506	--	--	0.8
Lake Minotaur	1517	--	--	0.2
Totals		--	--	1.0

Alternatives E and F allocate nearly all of the roadless area for unroaded, non-motorized Recreation.

Alternative G put high emphasis on partial retention and General Forest with 2,502 acres allocated to unroaded non-motorized recreations. This alternative is similar to A/NFMA and H

b. Summary

The following tables indicate, by alternative, the degree to which this area will be allocated to roadless management and, of the roadless management acres, what percent is motorized and non-motorized. These represent the Semi-primitive Motorized and Semi-primitive Non-Motorized Recreation Opportunity Spectrum (ROS) Classes. The area being allocated to roaded types of management activities will become Roaded Natural or Roaded Modified ROS opportunities depending on the intensity of development.

Percent of the Area Having Unroaded Allocation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	14	13	25	13	100	81	23	14	25	13

Percent of the Unroaded Allocation Area
In Terms of Motorized/Non-Motorized Recreation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	0/100	0/100	0/100	0/100	0/100	0/100	0/100	0/100	0/100	0/100

The area being allocated to roaded management activities will have increased dispersed roaded recreation opportunities and the possible opening of access to potential developed recreation sites. The trail miles within the area allocated to roading may be reduced as road construction occurs. The roadless character of these portions would also be lost.

2. Wild, Scenic, and Recreational Rivers

There are none associated with this roadless area.

3. Cultural Resources

Consideration of cultural resource values are required by a special set of historic preservation laws, regulations and policies. Particular efforts will be made in every alternative to inventory, evaluate, and provide for significant cultural resources in areas where Forest management activities are planned.

4. Scenery

Alternatives A/NFMA and H will allocate the Heather Lake trailhead to a Retention VQO. The mid-ground viewshed of the Little Wenatchee will generally be Partial Retention. The Fall Creek and Fish Creek basins will be allocated to General Forest or Maximum Modification VQO. Glimpses of heavily altered areas will be visible from the Little Wenatchee viewshed.

Alternatives B, D and J will allocate over three-fourths of the area to General Forest or Maximum Modification VQO. The area will appear heavily altered clear to the wilderness boundary. Only the Union Gap area will be allocated to Preservation VQO. Views from trails will be Maximum Modification.

Alternatives C and I will allocate most middleground views from the Little Wenatchee viewshed to Partial Retention VQO. The Fish Creek Basin will be allocated to Maximum Modification. The Heather Lake trail foreground will be allocated to Retention VQO.

Alternative E will allocate all areas to Dispersed Recreation, Unroaded, Non-motorized, and these areas are Retention VQO.

Alternative F will allocate all areas to Retention and Partial Retention VQO. A small area will be in General Forest.

Alternative G will allocate most areas to Retention and Partial Retention VQO. Scenic travel allocation increases the Partial Retention VQO. A small area will be allocated to Maximum Modification VQO. These areas are in the middleground areas from existing trails and roads.

The following table summarizes the Scenic component of this area by alternative in acres of Visual Quality Objective (VQO).

VQO	A/NFMA	B	Alternative							
			C Preferred	D	E	F	G	H	I	J
Preservation	--	--	--	--	--	--	--	--	--	--
Retention	2,013	1,738	2,925	1,738	11,067	9,266	3,074	2,013	2,925	806
Partial Retention	5,363	849	1,506	849	--	508	6,424	5,363	1,506	1,569
Modification	--	--	--	--	--	--	--	--	--	--
Maximum Modification	3,689	8,480	6,636	8,480	--	1,293	1,569	3,689	6,636	8,692
<u>Total Acres</u>	<u>11,067</u>									

Preservation indicates that only natural, ecological changes will occur.

Retention indicates an essentially natural appearing landscape will be present.

Partial Retention indicates the landscape will be slightly altered.

Modification indicates a moderately altered landscape will be present.

Maximum Modification indicates a heavily altered landscape may be present.

5. Wildlife

Alternatives A/NFMA and H would have one-third the impact on wildlife of Alternatives B, D and J due to the amount of land allocated to General Forest. Alternatives B, D and J would road 87 percent of the area and harvest timber on over 75 percent of the area.

Alternatives C and I would have less impact than Alternatives A/NFMA and H. Alternative E would have no impact on wildlife. Alternatives F and G would have a slight impact on wildlife.

6. Fisheries

a. Significant Effects

In Alternatives F and G, the area surrounding Fish, Lake and Theseus Creeks would remain unroaded. In Alternatives B, D and J the three areas could be roaded and intensively managed for timber production. Also, in all other alternatives the Fish Creek area could be managed under an intensive timber harvest prescription. In Alternative E, the vicinity of Theseus Creek could be intensively managed for timber production, while in the other roaded alternatives the area would be managed primarily with the extended shelterwood harvest prescription. Management of the Lake Creek area differs by alternatives: in Alternatives C, E and I, the lower one mile would be managed with extended shelterwoods with the upper one mile within the roadless area being unroaded. In Alternatives A/NFMA and H, the entire Lake Creek area would be managed with the extended shelterwood harvest prescription.

Roading these areas could change the recreational fishing opportunities. Since about two-thirds of the Forest's fishing occurs in roaded areas, it is expected that fishing would increase. This would help to meet a portion of the fishing demand (see Chapter III on Fish), but also could result in overfishing and reduction in both numbers and size of fish using the habitat. However, since the wild fisheries production is thought to be very low in these systems, except possibly Lake Creek, fishermen are unlikely to fish intensively here and overfishing effects should not occur. Also, only one mile of Lake Creek is included within this roadless area.

It is also possible that roading the unroaded areas could result in environmental degradation to streams due to timber harvest and road construction in the basins (see Chapter IV, Environmental Consequences). Some of these possible effects are also addressed in the soil and water environmental effects.

b. Mitigation Measures

In the alternatives that could road presently unroaded areas along Lake, Theseus, and Fish Creeks, the riparian protection zone prescription, the Wenatchee National Forest's Best Management Practices and all standards and guidelines common throughout riparian areas of the Forest would be applied in stream zones. This treatment should adequately protect the streams from a reduction in fish habitat capability.

If the areas are roaded, road closures could be implemented to reduce the impact of enhanced access on the native fish populations.

7a. Vegetation: Trees

Tree management would be planned on 9,476 acres or 86 percent of the area under Alternatives A/NFMA and H. Total vegetation manipulation area would be similar under Alternatives B, D and J. However, under these alternatives the emphasis would be on timber production rather than other resource enhancement and protection.

Alternatives C and I would manage 6,636 acres with emphasis on timber production (60 percent). In addition 1,654 acres will be managed for other resource values, especially scenic travel, that permit scheduled timber harvest. Total suitable forest that would be manipulated through timber sales is 5,872 or 58 percent of the area.

No timber management would be permitted under Alternative E, and only 1,950 acres or 18 percent under Alternative F.

Alternative G emphasizes management to provide scenic travel on 55 percent or 6,043 acres. Timber management would be emphasized on 1,569 acres.

7b. Vegetation: Forage

This roadless area has little potential for producing forage for livestock and moderate potential for big game. Due to the relatively small size, the importance of forage is not significant. Where forage is lost through natural succession, prescribed fire could mitigate this loss in all alternatives, but particularly Alternatives E, F, and G where little vegetative manipulation is proposed.

8. Soil and Water

a. Significant Effects

The environmental consequences of allocating the Heather Lake area to General Forest or Roadless Management are discussed by alternative below. No significant soil and water consequences are associated with Alternative E because soil and water disturbing activities occurring would be minimal. Up to 19 percent of the area could be allocated to timber harvest and road building in Alternative F, therefore, minor soil and water consequences would occur. Alternatives A/NFMA, B, C, D, G, H, I and J could allocate up to 87 percent of the area to timber harvest and road building. The environmental effects of timber harvest and road building are discussed in Chapter IV - Soil and Water sections.

The risk of degrading the soil and water resource increases with more timber harvest and road building. Alternatives A/NFMA, B, C, D, G, H, I and J pose more risk of degrading the soil and water resource than Alternative E due to more intensive management. However, since Wenatchee National Forest Best Management Practices (1982) and Forest Plan Standards and Guidelines will be employed, no unique soil and water effects are expected to occur because of forest management in this area.

b. Mitigation Measures

The mitigation measures that will be used in this area are the same as those discussed in Chapter IV - Soil and Water sections.

9. Air

Any additional prescribed burning generated in the Heather Lake roadless area as a result of the alternatives would not have a significant effect on air quality beyond the impacts discussed in Chapter IV.

The close proximity to the Glacier Peak Wilderness Area would increase the risk of a smoke intrusion into the Class I area from timber harvest activities in Alternatives A/NFMA, B, C, D, G, H, I and J.

10. Minerals

Since this area appears to have a low potential for the occurrence of mineral resources, the consequences on mineral resources do not appear to be extremely significant nor do they appear to vary appreciably by alternative. However, the management prescriptions under which the area would be managed in each alternative would restrict mineral activities to varying degrees (i.e., special stipulations in leases and in approved operating plans). The effects of these restrictions cannot be quantified, but the negative influence they would have on interest in conducting exploration activities within the area does vary by alternative and will, therefore, affect the potential for discovering and/or developing any unknown mineral resources of the area. This relative variation between alternatives is depicted on the following table.

Consequences on Mineral Resources

Restrictive Nature of Management Prescriptions	Acres Restricted by Management Prescriptions									
	A/NFMA	B	C PREFERRED	<u>Alternative</u> D	E	F	G	H	I	J
Withdrawn from Mineral Entry (valid existing rights will be determined and recognized)	0	0	0	0	0	0	0	0	0	0
Highly Restrictive	1,593	1,505	3,883	1,505	11,607	9,435	2,989	1,593	3,883	1,505
Moderately Restrictive	5,787	1,082	848	1,082	0	339	6,509	5,787	848	870
Relatively Few Restrictions	3,689	8,480	6,636	8,480	0	1,293	1,569	3,689	6,636	8,692

11 Roads

The miles of local roads shown below for each alternative are those that are expected to be constructed to permit timber harvest. They are included in the totals for the various alternatives shown in Chapter IV of the FEIS. It is assumed that the bulk of these roads will be constructed within the next 20 years. An analysis of the road development in unroaded areas during the past ten years indicates that for every acre harvested approximately 5.5 acres are accessed. It is assumed that 50 percent of these roads will be closed to public traffic, and that the remainder will be suitable for travel by high clearance vehicles only.

These mileages are estimates based upon typical road densities necessary to harvest timber on different slope classes. The actual road miles that will result from the implementation of the various alternatives will be determined during project planning, design, and environmental analysis. The assumptions made for this analysis will be monitored. The construction of any road will be subject to the appropriate environmental analysis. That analysis will address the effects on resources that are dependent upon a roadless setting, including any adjacent roadless area or wilderness. The decision to close any road will be made on a case by case basis, according to the Forest Road Closure Policy found in the Forest-Wide Standards and Guidelines.

	<u>Alternative</u>									
	A/NFMA	B	C	D	E	F	G	H	I	J
			PREFERRED							
Miles	27	25	22	25	0	4	23	27	22	25

12. Fire

The fire management workload generated in the Heather Lake roadless area as a result of the alternatives will not have a significant effect beyond the effects already described in Chapter IV.

A slight decrease in risk of industrial related fires would occur in the area as a result of little timber harvest in Alternatives E and F. Overall risk of fire will not significantly vary between Alternatives A/NFMA, B, C, D, G, H, I or J. The cost efficiency of fire suppression activities would be slightly decreased in Alternatives E and F due to limited access by ground based suppression resources. All other alternatives will vary little in cost efficiency. The impacts generated by slash disposal activities are discussed in Chapter IV.

13. Social/Economic

To measure this area in terms of its social value, a basic assumption is being made. This is, that because of the expressed interest in keeping as much of the inventoried roadless areas as possible in an unroaded condition, the more that condition is reflected, the higher the social value.

This condition is reflected for each alternative in the summary chart under item 1, Recreation, at the beginning of this section (Section V), which indicates the acres of unroaded management.

Also, as there is varying opinion as to the mode of transportation allowed, individuals must judge for themselves which alternative best meets that aspect of the social setting. There is also a summary table reflecting this condition for each alternative as referenced above which indicates the amount of motorized versus non-motorized use within the unroaded allocation.

A general measure of timber-oriented economic impacts can be made using the same table referenced above showing the amount of unroaded allocation. The larger the unroaded area, the greater the impact on timber-oriented jobs. If all of the estimated long-term sustained yield per year for this area were available, it would support 26.9 jobs.

14. Wilderness Potential

The roadless area has limited potential due to its size and shape. It has potential to be an addition to the Henry M. Jackson Wilderness. Alternatives A/NFMA, B, D, H, and J allocate a small percentage to unroaded condition and would have the greatest affect on wilderness attributes. Alternatives B, D, and J have the largest allocation to General Forest, at 4,287 acres or 47 percent of the area. Alternatives E and F provide the greatest retention of wilderness attributes. Alternatives C and I are more balanced than B, D, and J with 1,760 acres in General Forest. The General Forest allocation, as well as other alternatives with some level of timber harvest, will result in road construction, vegetation and timber stand management, and loss of wilderness characteristics.

CHELAN ROADLESS AREA

Size: Gross Acres: 71,571

Net Acres: 71,063

I. GENERAL INFORMATION

A. History

Originally suggested for scenic area consideration in 1915 as the Chelan-Sawtooth area. That proposed status remained intact through all planning efforts from that time. A portion was evaluated for addition to the Glacier Peak Wilderness as area F6031 under RARE II and was recommended as non-wilderness. As a result of the Washington State Wilderness evaluation and subsequent Act in 1984, area F6031 and adjacent lands extending to Lake Chelan became part of the Glacier Peak Wilderness. An additional area became part of the newly created Lake Chelan-Sawtooth Wilderness. In all, 62,386 acres of the original area became wilderness.

The original area consisted of a portion lying both north and south of Lake Chelan. The wilderness created has further separated the roadless areas with one being north of Lake Chelan and other being divided north and south of Holden Village in the Railroad Creek drainage.

The area is being treated as one unit but will be described by the three portions just mentioned, where it is felt necessary to do so.

B. Location and Access

The area is adjacent to both the Lake Chelan-Sawtooth (north of lake) and Glacier Peak Wildernesses (north and south of Holden) in Chelan County on the Chelan Ranger District.

Access to the north of Lake Chelan portion is via the South Navarre Road and Summit, Safety Harbor, Fish Creek and Prince Creek Trails. The north Holden portion is reached via Lake Chelan and the Railroad Creek Road and Ten Mile Trail. The south Holden portion is accessed by boat on Lake Chelan in addition to the Domke Lake, Pyramid Mountain Trails, and the Shady Pass Road.

C. Physiography and Soils

This area is dominated by glacially carved Lake Chelan. Conifers are common on both sides of the lake. The area ranges from Dutch Harbor to Point-No-Point on the north shore up to Sawtooth Ridge, and from Twenty Five Mile Creek to the Glacier Peak Wilderness boundary on the south shore, and then up to the Chelan mountains. The topography on the lower slopes is characterized by glacial deposit, glacially rounded bedrock, and some hanging valleys. The non-glaciated upper segments are dominated by very rough broken and craggy rock features.

(North of Lake Chelan) - Elevations range from about 1,100 to 8,400 feet. About 75 percent of the soils have formed in granitic residuum; however, most of them have some volcanic ash mixed into the surface layer. Most of the other soils have formed in deposits of volcanic ash and pumice (depths vary from 6 inches to as much as 30 feet). The granitic soils tend to be mostly on the very steep and rugged lands, whereas the ash and pumice soils will tend to occur more on the flatter landscapes. The ash soils are easily displaced once the protective vegetation has been removed. Ash soils tend to be very dusty when dry. Granitic soils are usually good for all weather use because they rarely become slippery when wet or dusty when dry.

(South Shore, North of Holden) - Elevations range from about 1,100 to 7,200 feet. About 80 percent of the soils have developed in granitic residuum; however, most of them have some volcanic ash mixed into the surface layer. Most of the other soils have formed in glacial till. All soils have at least some influence of volcanic ash in the surface layers. The glacial till soils tend to occur mostly along the slopes that face Lake Chelan, and in Railroad Creek. Both soil types have enough coarse materials in them so that they do not become slippery or sticky when wet, and both have good bearing strength.

(South Shore, South of Holden) - Elevations range from about 1,100 to 8,400 feet. About half of the soils have formed in deposits of volcanic ash and pumice (depths vary from as little as 6 inches to more than 30 feet), and the rest have formed in granitic residuum. There is also a small amount of soils that have developed in glacial till. Ash soils are easily displaced once the protective surface vegetation has been removed. Ash soils are very dusty during dry weather. The granitic soils are less dusty and have better bearing strength when unconfined.

D. Climate

The entire area is within the 25 to 60 inch precipitation zone with much of the moisture being in the form of snow which can reach depths of 18 feet.

E. Vegetation

North of lake portion: Seventeen percent of this area is tentatively suitable timberland. Of this, 1,506 acres are seedlings and saplings, most of which are on acres burned in the Safety Harbor fire of 1970. Nearly one-third of the area is nonvegetated rock.

Mature timber areas are dominated by Douglas-fir with ponderosa pine and lodgepole pine being important associated species. Acres burned in 1970 have dense ceanothus velutinous and lodgepole pine on the north slopes. Some nonstocked areas occur on more harsh aspects originally stocked by ponderosa pine and Douglas-fir. Planting has not been done due to access problems. Timber inventory plots show some of this area to be very productive with a site index of 100. (Site index average for the forest is 70 for dry and 83 for wet.) North of Holden portion: Twenty-nine percent of this area is tentatively suitable timberland. Forty-six percent of the area is classed as rocky nonvegetated, although some vegetation suitable for mountain goat habitat is present.

The principal species present is Douglas-fir. Previous logging removed much of the existing old-growth ponderosa pine leaving pole sized Douglas-fir.

Understory vegetation includes pinegrass, Oregon grape, ocean spray, and willow.

South of Holden portion: Thirty percent of this area is tentatively suitable timberland. However, much of the upper slopes are occupied by dense, small diameter lodgepole pine-subalpine fir stands. These stands are the result of past wildfires.

There are some highly productive small areas such as near Domke Lake where water loving species such as western red cedar and Englemann spruce mix with Douglas-fir to form high volume old-growth forests.

Understory vegetation varies from the pinegrass, ocean spray type at low elevation to dwarf huckleberry and false azalea at higher elevations.

F. Current Uses

The current use is for dispersed recreation. The major activities and their estimated annual use are as follows:

<u>Activity</u>	<u>Estimated Annual Recreation Visitor Days</u>
<u>North of Lake</u>	
Motorized Trail Riding	1,800
Hunting	1,000
Backpacking	<u>1,800</u>
Sub Total	4,600
<u>N. Holden</u>	
Hiking	100
Hunting	<u>200</u>
Sub Total	300
<u>S. Holden</u>	
Hiking	400
Hunting	250
Fishing	<u>500</u>
Sub Total	<u>1,150</u>
Total	6,050
<u>Total Area</u>	
Motorized Trail Riding	1,800
Hunting	1,450
Hiking	500
Backpacking	1,800
Fishing	<u>500</u>
Total	6,050

The area contains the following kinds and amounts of Recreation Opportunity Spectrum (ROS) classes:

<u>ROS Class</u>	<u>Acres</u>
<u>N of Lake</u>	
Semi-primitive Motorized (SPM)	23,780
<u>N Holden Portion</u>	
Primitive (P)	6,410
Semi-primitive Motorized (SPM)	2,860
<u>S. Holden Portion</u>	
Primitive (P)	14,013
Semi-primitive Non-Motorized (SPNM)	8,565
Semi-primitive Motorized (SPM)	15,435
<u>Total Area</u>	
Primitive (P)	20,423
Semi-primitive Non-Motorized (SPNM)	8,565
Semi-primitive Motorized (SPM)	42,075

There are 43.7 miles of trail within the entire area of which 43.3 are currently open to motorized use.

G. Appearance and Surroundings

South of Holden:

This area has a high visual variety of landform, vegetation, and rockform, and moderate to high waterforms (lakes and streams).

The area is a glaciated valley with a variety of texture patterns. Steep slopes climb up out of the valley to a ridgeline dominated by snowy peaks. Numerous streams dissect the landform. A portion of the area is secluded in the Domke Lake and mountain basin. This area has high visual variety.

The area is primarily viewed as foreground and middleground from scenic Lake Chelan and the ridge top trail of the Chelan mountains and the Domke Lakes Trail.

Boundaries are Lake Chelan to the north and northeast, Entiat mountain ridgetop to the south southwest, Glacial Peak Wilderness to the northwest.

North of Holden:

This area has a high visual variety of landform, moderate to high visual variety of vegetation and rockform, and low waterforms (lakes and streams).

There is a highly textured quality with vegetation on the north and northeast slopes, and a broken and open appearance on the south slopes. The ridgetop is rugged and open with sparse vegetation. The slopes are steep with avalanche paths along the glaciated valleys of Lake Chelan and Railroad Creek.

The area is primarily viewed as foreground and middleground from Railroad Creek, Lake Chelan, and Glacier Peak Wilderness.

Boundaries are the Glacier Peak Wilderness to the north and west, Lake Chelan to the northeast and east, and the side slope above Railroad Creek to the south.

North of Lake:

This area has a moderate to high visual variety of landform including knife ridges, moderate vegetation, rockform, and a few scenic lakes.

The area lies on the north side of Lake Chelan facing south, southwest and west. It includes the upper drainages of the Middle and East Fork of Prince Creek, and Safety Harbor. Vegetation is broken on steep open slopes with broad ridgetops and numerous densely vegetated creek drainages. Evidence of old burns in the Safety Harbor drainage create a sparse, blackened scene. Lakes include Cub and Boiling.

The area is primarily viewed as foreground and middleground from scenic Lake Chelan, the Sawtooth trail, and other trails along the drainage bottoms.

Boundaries are the Lake Chelan-Sawtooth Wilderness to the west, the Sawtooth ridge of the Okanogan National Forest to the north and northeast, Lake Chelan to the south and southwest, and roaded multiple use land to the east.

H. Attractions

Major attractive features are:

North of Lake:

High mountain meadows; Prince Creek and Safety Harbor Creek drainages; and Boiling and Cub Lakes, which are among the few lakes accessible by motorized transportation.

North of Holden Portion:

High-country deer hunting and historical mines and trails.

South of Holden Portion:

Scenic views from both the upper and lower elevations.

II. CAPABILITY-WILDERNESS CHARACTERISTICS

A. Manageability and Boundaries

North of Lake:

The north of the Lake area lies adjacent to and east of the new Lake Chelan-Sawtooth Wilderness. It is bounded on the south by Lake Chelan, on the north by Okanogan National Forest along the Sawtooth Ridge, and by a heavily roaded area to the east. The area consists of the Safety Harbor Creek drainage, the upper portions of the East Fork and Middle Fork of Prince Creeks, and a small area along Lake Chelan between Safety Harbor Creek and Grade Creek. All boundaries are easy to define and locate on the ground, with the exception of the line between Safety Harbor and Grade Creek. This line does not follow any prominent geographic feature, but instead follows a township line a few miles, then rambles around, finally ending at Lake Chelan below Grade Creek.

The area does include about three miles of an old road in Safety Harbor Creek drainage that will revert to a trail-like appearance after many years. This route is presently closed to four-wheeled vehicles.

Off site intrusions include the motorized use along the Lake Chelan corridor and the sights and sounds of the existing road system to the east of the area.

North of Holden:

This area lies north of the existing Railroad Creek Road #3100. The area abuts Glacier Peak Wilderness on the north and west and Lake Chelan to the east. Proposed boundaries would be easy to define and to locate on the ground. The area is located primarily within the Railroad Creek drainage with views of the Railroad Creek Road, Holden Village, and the mine tailing piles near Holden. The remainder overlooks the upper portion of the Lake Chelan basin. Even though the area has some off-site visual intrusions, the surrounding areas have such outstanding scenic qualities that the intrusions are minimized.

South of Holden:

This area consists of two units. One surrounds Domke Lake and the other lies on the south side of Lake Chelan from Bear Creek to Box Canyon. The large unit is bounded by the Chelan mountains, Lake Chelan, and the Glacier Peak Wilderness. The Domke Lake unit borders Lake Chelan and the Glacier Peak Wilderness. All boundaries are easy to define and locate. The Domke Lake unit is affected by visual and noise intrusions from motorized use on Domke Lake, Lake Chelan, and the Domke Lake National Recreation Trail #1280. The larger Lake Chelan unit is influenced by the motorized use along Lake Chelan, and the roaded area across Lake Chelan, visible from the southern portion of the area. All boundaries would be easily managed to maintain the primitive character except the shoreline along Lake Chelan. The shoreline is susceptible to random landings of motorized watercraft which would be difficult to administer.

B. Natural Integrity

North of Lake:

Mans' influence within the area has been considerable with a moderate impact on resources. Existing structures and activities include the following: remnants of an old electrical transmission line along Lake Chelan; developed campsites at Deer Point and Safety Harbor, docks, private land including year around homes and roads; water transmission lines; 3 miles of old road leading to a small concrete dam; a hunting cabin; old mine diggings and equipment; approximately 2 miles of old cat road for mining access; abandoned wood and metal water flume; cattle and sheep grazing allotments; trails open to motorbikes; firebreaks; and backcountry facilities such as log tables, wallowa toilets, hitchrack, steel fire-rings, and bulletin boards.

The offsite intrusions may include the sounds and sight of motorboats and aircraft along Lake Chelan, and the occasional glimpses of Grade Creek Rd. #3001. The area is a "buffer" zone between the developed area to the east and Lake Chelan-Sawtooth Wilderness to the west. This zone has had a long history of mans' influence and activities.

North of Holden:

The majority of the land within the area is so rugged and remote that man has had very little influence on natural conditions. The Railroad Creek Road along the south boundary of the unit has a very light volume of traffic, primarily serving Holden Village needs. The road is well screened with heavy vegetation. Holden Village, a small year-round community with numerous structures, is visible from some vantage points within the area.

A user built trail of approximately two miles in length is located up Ten Mile Creek. An old trail located on Lightning Ridge and Lucerne Mountain was abandoned many years ago. A small, two unit developed campsite for boaters is located at Elephant Rock on Lake Chelan. Facilities include a small dock, pit toilet, tables, and fire-rings. A small tract of private land exists at the mouth of Lightning Creek, with a cabin and dock.

South of Holden:

The Domke Lake portion has a considerable number of existing human influences including a resort with four cabins, rental motorboats, horse grazing, trails, abandoned powerline corridor, developed campsites with docks, tables, firerings, pit toilets, an old abandoned lookout site, special use summer home, fences, and float plane use. The Domke Lake area is accessed by a National Recreation Trail which permits motorized use. Aircraft, both private and commercial, regularly use Domke Lake as a destination area for fishermen and resort users.

The large southern portion of the area has no human influence throughout the majority of the area except along the shoreline of Lake Chelan. Some of the developments found along the shoreline includes summer homes, docks, campgrounds, and navigation markers. Lake Chelan has a fairly heavy amount of power boat and float plane use that influences the user by sight and sound. This influence is confined primarily to the lakeshore area.

C. Natural Appearance

North of Lake:

The impacts on the natural aspects of the area are moderate. The past disturbances which have had the greatest impact on the area's natural character are the old Reclamation Road into Safety Harbor Creek, mining activities in the head of Safety Harbor Creek, the hunters cabin near Uno Peak, and the developed recreation sites on Lake Chelan. Firebreaks on Goat Mountain Ridge were constructed to stop the devastating fires of 1970. Watershed damage, as a result of these fires, contributed to the heavy channel erosion evident in Safety Harbor Creek.

North of Holden:

A minor amount of human activity has taken place and the area appears natural and free from disturbance. The offsite intrusions are subservient to the overwhelming beauty of the surrounding landscape.

South of Holden:

The Domke Lake area has a long established history of motorized use. Numerous structures and developments within the area detract from the wilderness capability. Alterations, such as old powerline corridors, reduce the natural appearance of the area. Domke Lake as a destination area for float planes does detract from the natural aspects of the area even though there is little effect on resources. It is difficult to escape the motorized uses and developments which surrounds the area.

The larger southern portion of area contains a highly natural appearance. Once the user leaves the shoreline of Lake Chelan, only the occasional sight and sound of planes and boats mar an otherwise totally natural setting.

D. Opportunities for Solitude

North of Lake:

The two heaviest used trail corridors leading into the Chelan-Sawtooth Wilderness are through this unit. The area is extensively trailed having approximately 25 miles open to motorbike use. Cub and Boiling Lakes provide popular camping and fishing destination points. Solitude can be increased by traveling cross-country, which is possible due to the relatively openness of the terrain. Also, avoiding the popular destination lakes can provide a higher level of solitude. The Lake Chelan waterway has a relatively high amount of use by motorboats and aircraft which influences the solitude along the southern boundary of the area.

North of Holden:

The area offers high opportunities for solitude. The area is not large but the remoteness, rough topography, and vegetative cover offers ample opportunity for the user to disperse. Considering that the unit is contiguous with Glacier Peak Wilderness, a user would develop a strong feeling of the spirit of wilderness.

South of Holden:

The Domke Lake area offers only a moderate level of solitude. The outside influences “squeeze in” on the area reducing an opportunity for seclusion. However, the majority of the area between Bear Creek and Box Canyon can offer a relatively high level of solitude. The large amount of area, the ruggedness and the lack of access trails, all combine to offer considerable solitude once a visitor leaves the shoreline of Lake Chelan.

E. Opportunities for Primitive Recreation

North of Lake:

Due to the high, open, less rugged topography, good opportunities exist for primitive recreation off the developed trail system. Cross-country backpacking, hiking, fishing, horseback riding, and hunting are popular activities. High elevation cross-country skiing holds good potential, however, winter access to the area is difficult.

North of Holden:

The area offers a moderately high opportunity for primitive recreation experience such as backpacking, canoeing, camping, fishing, hunting, and mountain climbing. Despite the fact the area lies adjacent to the motorized use on Lake Chelan, Holden Village, and Railroad Creek Road, most users would experience the primitiveness of the area once they went beyond its boundaries.

South of Holden:

Primitive recreation opportunities include mountain climbing, cross-country backpacking, fishing, big game hunting, camping, and photography. Once away from the influence of Domke Lake and Lake Chelan, the opportunity for a primitive experience is good.

F. Challenging Experiences

North of Lake:

The area has a variety of terrain features that provide a moderate amount of challenge for both summer and winter recreation access.

North of Holden:

There are ample opportunities for challenging experiences, self-reliance and adventure within the area. Mountain climbing and off-trail high mountain hiking offers the most challenge.

South of Holden:

The area can offer a high level of challenging experiences due to the rough topography, difficult access and extreme elevation gain over a short distance. A transverse across the area from any direction will test a person’s self-reliance, judgment, and ability.

G. Special Wildlife Features

Peregrine falcons have been seen in the area during the summer months but no nest sites have been located during the winter and spring months. No other threatened or endangered species have been located in this area. The extent of use of the area by sensitive species is unknown.

H. Historical and Scientific Study

North of Lake:

The area has an unusually large floral display in early summer due to past wildfires and sheep grazing. The hunting cabin under special use permit near Uno Peak is eligible for the National Register of Historical Places.

North of Holden:

The Edil Mine offers evidence of the tenacity of miners seeking gold at the turn of the century. The only other historical attribute is the abandoned trail located on Lightning Ridge.

South of Holden:

The Domke Lake area is rich in the tradition of the old mountain men and trappers, such as Cool and Stuart. The history of these men have made them a legend to the local people. Their developments in the Domke Lake area are an integral part of the natural environment of the area.

III. RESOURCES AND POTENTIALS

A. Recreation

The area has potential value for unroaded types of recreation activities. Estimated carrying capacity by ROS class is as follows:

ROS Class	Capacity in Potential Recreation Visitor Days Per Year
North of Lake	
Semi-primitive Motorized (SPM)	71,000
North of Holden	
Primitive (P)	5,100
Semi-primitive Motorized (SPM)	8,600
	13,700
South of Holden	
Primitive (P)	11,200
Semi-primitive Non-motorized (SPNM)	8,600
Semi-primitive Motorized (SPM)	46,000
	65,800
Area Total	
Primitive (P)	16,300
Semi-primitive Non-motorized (SPNM)	8,600
Semi-primitive Motorized (SPM)	125,600
	TOTAL 150,500

B. Wildlife

The area provides summer and winter range for a large deer herd^d and several small mountain goat herds. The mountain goat populations declined from the early 1970's to the early 1980's. In 1983 and 1984, a total of 44 mountain goats were transplanted to the Lake Chelan drainage in an effort to build the goat populations up. The area is also used by black bear, cougar, and a variety of small mammals and birds.

C. Fisheries

North Lake:

Although this roadless area includes a long section of the Lake Chelan shoreline, there is very little of significance relating to fish. Safety Harbor Creek is used for spawning by kokanee salmon coming from Lake Chelan. The use is limited to about one-quarter of a mile above its mouth. No other small streams along the Lake are used by a significant number of spawning kokanee.

There is also use by other species of fish in some of the streams in the area. Safety Harbor Creek and the Middle Fork of Prince Creek have populations of trout which are fairly heavily fished. The East Fork of Prince Creek has a practically insignificant amount of fish production.

Cub Lake, along the Middle Fork of Prince Creek, is a popular fishing lake because of easy trail access. There are large numbers of fish in the lake that may be of reduced size because of overpopulation and low productivity. Boiling Lake, the only other lake in the roadless area, has a small trout population. Although very scenic, it is more important as a camping site than a fishery attraction.

North Holden:

There is nothing significant about fish in this area.

South Holden:

A very large lake, Domke Lake, is located in this roadless area. It has a population of rainbow trout that is fairly heavily fished. It has been occasionally stocked. Fish migrate out of Domke Lake to Lake Chelan. Since there are falls on the Creek, there is no reverse migration possible from Lake Chelan to Domke.

There are no other streams with significant fish populations in this area.

D. Water

North Lake:

Portions of this area include withdrawn lands for purposes of power withdrawals and impoundments. There are numerous locations along Lake Chelan where the withdrawal extends into this inventoried designated roadless area.

Water yield information is available for the Chelan River (Lake Chelan). Only a small percentage of runoff in Lake Chelan emanates from National Forest lands in this drainage basin (approximately 12 percent). The majority of water originates in wilderness or from National Park lands. The Chelan Public Utility District #1 has water yield information for this basin.

North Holden:

There is a water transmission and dam pipeline at Holden Village, Sections 7 and 8; T31N, R17E, WM. The original FPC #2023 license was for an intake. The conduit was replaced with a Special Use Permit in 1951.

South Holden:

FPC #1465 withdraws portions of a section for the transmission line to Holden. This line has been removed but the withdrawal remains along a 50 foot right-of-way each side of center line leading from Lake Chelan up to Domke Lake via Domke Creek. The right-of-way traverses Railroad Creek to Holden.

The Chelan Copper Mining Co. made application for a power project at Domke Lake. The Project (FPC #1200) was requested by application in March 1932. The proposal was never implemented but remains as a withdrawn site.

E. Livestock

North Lake:

The north one-half of this area contains all of the Horsethief (a portion of Buttermilk) domestic stock allotments. These allotments are currently being used in alternating years by sheep (Buttermilk Allotment) and by cattle (Horsethief Allotment). Topography and key wildlife range limits the development potential for domestic stock on the south one-half of the area along Lake Chelan.

North Holden:

The Railroad Creek domestic stock allotment is within a portion of this area near Lucerne. It is currently being used for commercial recreation stock (horses) under paid permit. Topography and access limits the development of the remainder of the area.

South Holden:

The Railroad Creek allotment is within a portion of this area near Domke Lake. It is currently being used for commercial recreation stock (horses) under paid permit. Development potential for the remainder of the area is limited due to topography and access

F. Timber

The entire area contains 17,933 acres of tentatively suitable timberland. Stand, volume, and other data are as follows:

Ecotype	Stand Size	Acres	Estimated Standing Volume (MMBF)	(MMCF)
N. of Lake				
Wet	Mature	890	25.2	4.6
Wet	Immature	233	4.2	0.8
Wet	Seedling-Sapling	700	---	---
Dry	Mature	1,018	12.6	2.3
Dry	Immature	296	2.9	0.5
Dry	Seedling-Sapling	806	---	---
	Subtotal	3,943	44.9	8.2
N. Holden				
Wet	Mature	148	8.2	1.5
Wet	Immature	424	12.9	2.4
Wet	Seedling-Sapling	106	---	---
Dry	Mature	657	4.2	0.8
Dry	Immature	1,314	7.6	1.4
	Subtotal	2,649	32.9	6.1
S Holden				
Wet	Mature	2,459	69.7	12.8
Wet	Immature	2,480	44.6	8.2
Wet	Seedling-Sapling	42	---	---
Dry	Mature	3,074	38.5	7.1
Dry	Immature	3,138	30.8	5.6
Dry	Seedling-Sapling	148	---	---
	Subtotal	11,341	183.6	33.7
Grand Total		17,933	261.4	48.0

For the entire area, the estimated maximum biological potential contribution to the long-term sustained yield is 5.4 MMBF (1.0 MMCF) per year.

G. Minerals

North Lake:

This area is dominantly overlaid by granitic rocks of Mesozoic age, but is also overlaid in part by Upper Jurassic - Lower Cretaceous sedimentary and volcanic rocks. The area has not been studied by the USGS or the U.S. Bureau of Mines, but it does have reported occurrences of limestone and pumice. Neither has been adequately investigated to determine whether the deposits have commercial value, if any. Bureau of Land Management Records (1/23/85) indicate that nine lode claims have been located within the area, one of which is considered abandoned for failure to record assessment work. None of the area is classified "prospectively valuable" for leasable minerals, and there are no existing leases nor are there any pending lease applications.

North Holden:

This area is underlain by pre-Cretaceous metamorphic rock and granitic rock of Mesozoic age. Of importance for mineral resources are the contact or shear zones between these two types of rocks, as well as the body of the Riddle Peak pluton itself. The subject area lies within the Railroad Creek mining district which is best known for the Holden mine where substantial amounts of copper, gold, silver, and zinc, were produced from 1938 to 1957. The Holden Mine deposit itself lies south of the subject land and significant deposits of similar nature are not known to occur within the C-2 area. Based upon the U.S. Geological Survey and U.S. Bureau of Mines study of the Glacier Peak Wilderness and adjacent areas, however, the western portion of the subject area is considered to have a "moderate" potential for the occurrence of copper, zinc, gold, and silver resources in volcanogenic massive-sulfide deposits, and a "low" potential for the occurrence of nickel, cobalt, chromium, and platinum group metal resources in mafic layered complexes. According to Bureau of Land Management records (1/23/85), nine lode claims and three placer claims have been located within or immediately adjacent to the area, for which assessment work has been recorded through 1985. Except for the western 10 percent of the area, which is classified "prospectively valuable" for geothermal resources, the area is not considered to have potential for any of the leasable commodities. It has no existing mineral leases, nor are there any lease applications pending.

South Holden:

This area is dominantly underlain by pre-Cretaceous metamorphic rocks, but is also underlain in part by Mesozoic intrusive rocks. The area around Milham Pass, which is underlain by a rhyodacite plug containing disseminated sulfides (Church and Strotelmeyer, 1984), is of most interest as far as mineral potential is concerned. That area has been identified by the U.S. Geological Survey and U.S. Bureau of Mines as having a "low" potential for the occurrence of base-end precious metal resources in hydrothermal veins. The area also has deposits of pumicite, which have not been adequately investigated to determine their commercial value, if any. According to Bureau of Land Management records (1/23/85), no mining claims have been located within the area. The area has not been classified "prospectively valuable" for any of the leasable commodities, and it has no existing mineral leases nor any pending lease applications.

H. Cultural-Historical

North Lake:

Centuries before the first Euro-American contact, ancestors of the Chelan Indians made their homes along the lower margins of Lake Chelan. From these villages, individual Indians and families regularly traveled uplake, camping along the shores and making hunting and food plant gathering expeditions into the appropriate backcountry areas. To date, however, archaeological indications of these uses north of the lakeshore have not been located.

Historically, the Chelan-Sawtooth North Lake unit was used primarily for sheep grazing, hunting, and small scale mining. There is one National Register-eligible site, the Crow Cabin, within the unit, at least two reported sheep camps; and the remnants of former mining operations in Miners and Horsethief Basins. The Coyote Creek incline, a unique historic feature associated with early logging and with later construction of the Lake Chelan Reclamation District irrigation flume, is located just west of Coyote Creek, in the southern portion of the unit.

North Holden:

Indian use of this unit would be similar to that described in Unit C1. No archaeological sites are known within the area, but a single, unverified pictograph site has been reported. Historic uses would most likely relate to the succession of mining activities that took place at Holden, on Railroad Creek.

South Holden:

Indian use of this unit would be similar to that described in Unit C1. One pictograph site and reports of lithics occurrences exist along the south and west shore of the lake, between Lucerne and Twenty-five Mile Creek. However, there are no archeological sites known in the backcountry south of the lake.

The predominant historic use of this unit was in fire protection. Lookouts were in existence on Junior Point (1931-68), Big Hill (1933-1950's), Pyramid Mountain (1917-1954), and Domke Mountain (1920-1970). Sheep grazing was generally confined to the area south and west of the Chelan Mountain divide, but allotment boundaries did spill over into the upper Corral and Big Creek drainages. The northern part of the unit was within the trapping territory of A.L. Cool, who preceded Gordon Stuart at Domke Lake. Some remnants of this use may yet exist.

I. Land Use

The South Holden unit contains the Domke Lake resort which is under Special Use Permit.

J. Fire

Annual fire occurrence is moderate and primarily caused by lightning. Fuel accumulations are moderate at lower elevations to exposed rock and alpine meadows at higher elevations. Periodic large fires have occurred.

K. Insects and Disease

North Lake:

Both western spruce budworm and tussock moth defoliations have occurred in this area in the past. Dwarf mistletoe is also heavy in the Douglas-fir. Mature lodgepole pine is subject to mountain pine beetle attacks.

All of these pests can contribute to increased fuel loading and eventual large fires such as occurred in 1970.

North Holden:

Mistletoe in Douglas-fir is the primary damaging agent in this area. Western spruce budworm, although not as damaging here as in Fish Creek, is a potential problem due to the high proportion of Douglas-fir host trees.

South Holden:

The most threatening insect in the area is the mountain pine beetle. Lodgepole pine stands created by past fires in areas such as Big Creek are becoming increasingly susceptible to mountain pine beetle.

A timber sale is planned in Big Creek to harvest high risk lodgepole pine. Adjacent stands in Twenty-five Mile Creek have large areas infected with root rot and dwarf mistletoe and it is expected that Douglas-fir dominated stands to the west would also be affected.

L. Private Lands

There are 508 acres of private lands within the North Lake area. These are all accessed by facilities lying outside of the area and are subdivided into multi-ownerships. Acquisition possibilities are considered to be very difficult and costly.

IV. NEED

A. Nearby Wilderness and Other Roadless Areas

The North of Lake area is located immediately adjacent to the eastern boundary of the Lake Chelan-Sawtooth Wilderness Area. Both the North and South of Holden portions are bounded in part by the Glacier Peak Wilderness and Lake Chelan. The South Holden portion also adjoins the Entiat roadless area to the south and is near the Stormy Mountain roadless area to the east.

B. Distance from Population Centers

The entire area is reachable within two to four hours driving time from population centers such as Seattle, Tacoma, Yakima, Tri-Cities and Wenatchee.

C. Need for Ecosystem Representation

North Lake:

The ecosystem is adequately represented in the adjacent Lake Chelan Sawtooth Wilderness.

North Holden:

No unique ecosystems are known to exist within the area that aren't already adequately represented in the adjacent Glacier Peak Wilderness.

South Holden:

There are no unique ecosystems represented that are not already contained within the adjacent Glacier Peak Wilderness and the Lake Chelan-Sawtooth Wilderness across Lake Chelan.

D. Interest by Proponents, Including Congressional

North Lake:

Recent wilderness legislation created the Lake Chelan-Sawtooth Wilderness adjacent to the Chelan-Sawtooth North Lake unit. Congress considered but deleted this area from wilderness due to the large trail system that had been reconstructed with State IAC funds and the large amount of interest from motorbike users. Portion of this area is presently under permit for helicopter skiing and holds potential for both cross-country and alpine helicopter assisted skiing.

The area has had a long history of considerable public support for the management of the area as roadless, scenic or wilderness.

North Holden:

The area was previously considered as a part of the entire Lake Chelan roadless area. The majority of the Lake Chelan area was designated wilderness in 1984. Although there was little public interest specific to this area, it can be assumed that the public is still interested in this area for its roadless and wilderness attributes. Its proximity to Glacier Peak Wilderness will continue to make the area a candidate for wilderness inclusion by the public.

South Holden:

The Domke Lake area was specifically excluded by Congress as part of the Washington State Wilderness Act of 1984 Glacier Peak Addition. Local residents have always favored roadless status without wilderness designation due to the long history of the Domke Lake Resort and the float plane use of Domke Lake.

The remainder of the Chelan-South Holden area has had a long public interest in the area as a roadless, scenic, or wilderness area. It is contiguous with Glacier Peak Wilderness and only a mile across the lake from the Lake Chelan-Sawtooth Wilderness. Due to its outstanding scenic beauty, public support for management as a roadless area is expected to continue.

E. Public Input

North Lake:

This area was not considered during the RARE II Planning because it had previously been addressed by the Chelan Unit Plan in 1976. The Chelan Unit Plan allocated the area for Scenic-Roadless management. Two special interest groups proposed wilderness status for the area during the development of the Unit Plan.

North Holden:

This area was not considered during the RARE II planning process because it was addressed in the Chelan Unit Plan of 1976. The Chelan Unit Plan land allocation was to designate the area for Scenic-Roadless management. Special interest groups have proposed wilderness status of this area (Lake Chelan) for many years.

South Holden:

The area was not considered during the RARE II planning because it had previously been addressed in 1976 by the Chelan Planning Unit. This plan allocated the Chelan-South Holden Unit to proposed Scenic Area status. Past public input by some special interest groups have proposed wilderness classification for this area.

F. Other Public Involvement

None

V. ENVIRONMENTAL CONSEQUENCES

A. Environmental Consequences Associated with the Alternatives

1. Recreation

a. Significant Effects

The Chelan Roadless Area is located on both sides of Lake Chelan and is 71,063 acres in size. The unit on the north side of the lake is adjacent to the Lake Chelan-Sawtooth Wilderness and the unit on the south side of the Lake is adjacent to Glacier Peak Wilderness.

The area offers excellent opportunities for horse packing and backpacking as well as ORV use. Boiling Lake is a focal point for backcountry campers and hunters. Surprise Lake is a heavily used destination lake for fishing and camping. The Summit Trail serves as the transportation corridor to the Lake Chelan-Sawtooth Wilderness and the Upper Lake Chelan Area.

The roadless unit on the south side of Lake Chelan has been inventoried as semi-primitive, non-motorized with the exception being the area adjacent to Domke Lake. Other than the area near Domke Lake, the area is trailless and basically pristine in character.

Recreational activities are mostly big game hunting and cross country back packing. Semi-primitive, non-motorized use is relatively light, estimated at 100 RVD's with the exception of the Domke Lake Area. Domke Lake is accessed by a National Recreation Trail open to bikes, and a special use resort with rental boats and motors operates on the Lake. The semi-primitive motorized use adjacent to Domke Lake is estimated at 200 RVD's.

Alternatives A/NFMA and H would allocate close to 90 percent of the area to a scenic designation. The objective would be to manage for recreation use substantially in a natural condition. The purpose would be to protect the natural beauty and to foster public use and enjoyment. Some timber harvest may take place if compatible with the recreation use or if necessary to enhance other resources such as wildlife. Under these alternatives the areas would be administratively classified Scenic under 36 CFR 294.

Alternatives B and D result in 59 percent of the area being in a roadless category, the majority in semi-primitive, non-motorized status. The north unit and small area around Domke Lake is in a semi-primitive, motorized setting. The biggest change from the existing situation is the conversion of approximately 35 percent of the area to a Roaded Natural ROS class. Within this area wildlife recreation values would be emphasized, possibly including some vegetative management or road construction. This prescription falls within the Big Creek, Corral Creek, Little-Big Creek drainages. The wildlife prescription may appeal to some wildlife recreation users, but may conflict with the roadless/non-motorized advocates of the area.

Another seven percent of the area in the Safety Harbor drainage will change to a roaded modified setting with the primary emphasis on timber removal.

Alternatives B, D and J result in a more complete range of recreational opportunities; however, considering the location and pristine character of this roadless unit, the overall recreational input could be considered negative by the roadless advocates.

Alternatives C and I would allocate about 81 percent of the area to roadless management. These alternatives would retain about the same ROS settings as the existing inventoried use. In addition, about 11 percent of the area will be designated under the wildlife management prescription on the north shore of Lake Chelan. This strategy is within ROS Class Roded Natural; however, due to the lack of timber over most of the area, no timber cutting or road building is anticipated.

Under Alternatives C and I the portion of the trail system that is in this roadless area is allocated as follows:

Trail Name	Trail Number	Unroaded Non-Motorized	Unroaded Motorized	Roded Motorized
Prince Creek	1255	--	6.9	--
E. Fk. Prince Creek	1257	--	3.0	--
Summer Blossom	1258	--	6.0	--
Summit	1259	--	11.0	--
Hoodoo Pass	1259.3	--	1.3	--
Uno Peak	1260	--	6.1	--
Safety Harbor	1261	--	3.8	--
Graham Harbor Creek	1269	0.4	--	--
Domke Lake	1280	--	3.2	--
Domke Mt. Lookout	1280.1	--	2.0	--
Totals		0.4	43.3	--

Alternatives E and F emphasize the amenity values and the roadless management prescriptions. Both these alternatives allocate about 90 percent of area to non-motorized dispersed recreation. The existing inventoried dispersed recreation motorized use will be eliminated and converted to non-motorized use.

A wildlife management prescription totaling 10 percent of the area exists on the north shore of Lake Chelan. This area would be designated Roded Natural; however, no roads are anticipated to be constructed.

Alternative G emphasizes the amenity values in a semi-primitive, motorized setting. Eighty-two percent of the area is in roadless status with 68 percent allocated to non-motorized use and 32 percent of the area allocated to motorized use. The additional area in the motorized setting is in a corridor along the south shore of Lake Chelan. This alternative would allow for construction of a trail from Twenty-Five Mile Creek to Lucerne with ORVs permitted from Twenty-Five Mile to Bear Creek (wilderness boundary).

The remainder of the area would be designated Roded Natural under the scenic travel and wildlife prescriptions. Some timber may be cut in the background areas of the scenic travel strategy but no timber is available for removal within the wildlife management area on the north shore of Lake Chelan.

b. Summary

The following tables indicate, by alternative, the degree to which this area will be allocated to roadless management and, of the roadless management acres, what percent is motorized and non-motorized. These represent the Semi-primitive Motorized and Semi-primitive Non-Motorized Recreation Opportunity Spectrum (ROS) Classes. The area being allocated to roaded types of management activities will become Roaded Natural or Roaded Modified ROS opportunities depending on the intensity of development.

Percent of the Area Having Unroaded Allocation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	84	59	90	59	100	85	82	84	90	52

Percent of the Unroaded Allocation Area
In Terms of Motorized/Non-Motorized Recreation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	100/0	32/68	48/52	32/68	2/98	0/100	32/68	100/0	48/52	64/36

The area being allocated to roaded management activities will have increased dispersed roaded recreation opportunities and the possible opening of access to potential developed recreation sites. The trail miles within the area allocated to roading may provide a less semi-primitive recreation experience with more roaded natural or roaded modified setting.

2. Wild, Scenic, and Recreational Rivers

There are none associated with this roadless area.

3. Cultural Resources

Consideration of cultural resource values are required by a special set of historic preservation laws, regulations and policies. Particular efforts will be made in every alternative to inventory, evaluate, and provide for significant cultural resources in areas where Forest management activities are planned.

4. Scenery

Alternatives A/NFMA and H will allocate the majority of the area to Retention and Partial Retention VQO. The Navarre Peak south along the ridges will be allocated to Intensive Range allocation or Modification VQO. Most viewsheds will have high visual quality.

Alternatives B and D will allocate lands with a variety of prescriptions within the viewshed to provide contrasting visual quality. The Chelan viewshed between Lucerne north to Wolverine Creek will be slightly altered. Deep Harbor, Corral Creek, and Big and Little Creek Basins to Chelan Mountain ridge top will be allocated to Partial Retention VQO. The area south of Holden Village will be allocated to Roaded Natural Partial Retention VQO. Three-quarters of the Safety Harbor drainage will be allocated to Maximum Modification.

The upper end of Railroad Creek drainage, Domke Lake, and the upper end of Sawtooth Ridge will be allocated to Retention VQO. Navarre Peak area will be Maximum Modification.

Alternative J allocates most areas to Modification and Maximum Modification.

Alternatives C and I allocate many areas to Preservation, Retention, and Partial Retention VQO. The visual resource will have high visual quality except along the upper end of South and North Navarre area, the upper end of Junior Point, and Big Hill areas. These areas are allocated to Maximum Modification. Domke Lake Basin is dispersed recreation, unroaded-motorized or Retention VQO.

Alternative E allocates most areas to Retention VQO. The Upper Navarre Area will have high visual quality without intensive range management.

Alternative F will allocate most areas except the Navarre Area to Retention VQO. There is no General Forest or dispersed recreation unroaded, motorized allocations in this alternative.

Alternative G will allocate most areas to Retention and Partial Retention VQO. There is no General Forest allocation in this alternative. Partial Retention VQO is the allocation along the foreground and parts of the middleground of Lake Chelan from Point to No Point.

The following table summarizes the Scenic component of this area by alternative in acres of Visual Quality Objective (VQO).

VQO	A/NFMA	B	Alternative							
			C PREFERRED	D	E	F	G	H	I	J
Preservation	--	--	--	--	--	--	--	--	--	--
Retention	63,239	44,901	61,522	44,901	64,512	63,307		63,239	61,522	14,585
Partial Retention	6,299	5,089	1,612	5,089	--	1,205	3,964	6,297	1,612	6,849
Modification	1,039	15,721	5,215	15,731	6,551	6,551	7,780	1,039	5,215	31,927
Maximum Modification	488	5,342	2,714	5,342	--	--	--	488	2,714	17,702
Total Acres	71,063	71,063	71,063	71,063	71,063	71,063	71,063	71,063	71,063	71,063

Preservation indicates that only natural, ecological changes will occur.

Retention indicates an essentially natural appearing landscape will be present.

Partial Retention indicates the landscape will be slightly altered.

Modification indicates a moderately altered landscape will be present.

Maximum Modification indicates a heavily altered landscape may be present.

5. Wildlife

Alternatives A/NFMA and H would have an insignificant effect on wildlife use in the area. Alternatives B and D would allow for harvest on eight percent of the area which, even though minor, would be seven times the impact of A/NFMA and H. Alternative J would have the most area allocated to timber emphasis with 26 percent of the area. Alternatives C and I would have less effect than B, D and J, but more than A/NFMA and H due to the development of motorized use on 23 percent of the area. Alternatives E and F would have less effect than A and H. Alternative G would have less impact than A/NFMA and H, but more impact than E due to the amount of motorized recreational development.

6. Fisheries

a. Significant Effects

In all alternatives the areas of Cub, Domke, and Boiling Lakes and the Middle Fork of Prince Creek would remain roadless. In Alternatives A/NFMA, E, and H, all of Safety Harbor Creek in the roadless would also remain unroaded. In Alternatives B, C, D, F, G, I, and J the lower areas of Safety Harbor Creek would be managed principally to benefit domestic livestock (range management), while the upper reaches would be unroaded.

In the alternatives in which range management would dominate the management, it is possible that roads could be built in the vicinity of Safety Harbor Creek. Rooding these areas could change the recreational fishing opportunities, although the total mileage of streams in this roadless is quite small. Since about two-thirds of the Forest's fishing occurs in rooded areas, it is expected that fishing would increase slightly. However, there is already a fair amount of recreational fishing use of Safety Harbor Creek and the net use would not change.

Rooding the unroaded areas could also result in environmental degradation to streams due to timber harvest and road construction in the basins. Since the area would also be managed for livestock use, there could be some stream degradation or enhancement due to grazing. Some of these possible effects are also addressed in the soil and water environmental effects section.

b. Mitigation Measures

In the alternatives that could road presently unroaded areas or manage areas for livestock production, the riparian protection zone prescription, the Wenatchee National Forest's Best Management Practices and all standards and guidelines common throughout riparian areas of the Forest would be applied in stream zones. This treatment should adequately protect the streams from a reduction in fish habitat capability.

If the areas are rooded, road closures could be implemented to reduce the impact of enhanced access on the native fish populations. Also, allotment plans would be written which should consider streamside use by cattle and necessary mitigating measures.

7a. Vegetation: Trees

Under all alternatives it is expected that more area will remain unroaded than is rooded. The range of tree management emphasis activities is from 17,702 acres (25 percent) scheduled for timber emphasis in Alternative J to no scheduled harvest in Alternative E.

Alternative A/NFMA has 488 acres (one percent) timber emphasis and an additional 8,036 acres of vegetation manipulation with other resource emphasis planned.

Alternative H is similar to A except that old growth management is planned on 848 acres.

Alternative C, the preferred alternative, and Alternative I have identical acre allocations. Both have 1,739 acres of timber emphasis, or two percent of the area. An additional 11,193 acres would be managed for other resource values that permit vegetative manipulation including timber sales. The primary difference between Alternatives C and I is the rate of harvest. Under Alternative I, more harvest activity would be scheduled in the first decade.

Alternatives F and G do not allocate any acres to timber emphasis. However, they do anticipate vegetative manipulation through timber sales on 8,967 to 12,021 acres or 13 to 17 percent of the area.

7. Vegetation: Forage

This large roadless area contains portions of three livestock allotments which will remain roadless in all alternatives. Natural succession will reduce the forage base in these allotments and, without prescribed fire, adequate forage may not be produced in the future for big game or livestock. Livestock can be moved to new forage areas where vegetative manipulation through silvicultural practices occur. With the ability to relocate livestock to new forage areas, Alternatives C, H, and I will contribute adequate forage for both big game and livestock. Alternatives A/NFMA, B, and D will provide forage in excess of projected needs. Alternatives E, F, and G will not meet the forage needs for livestock in the fourth and fifth decade.

8. Soil and Water

a. Significant Effects

The environmental consequences of allocating the Chelan roadless area to General Forest or Roadless Management are discussed by alternative below. No significant soil and water consequences are associated with Alternative E because soil and water disturbing activities occurring would be minimal. Up to 20 percent of the area could be allocated to timber harvest and road building in Alternatives A/NFMA, C, F, G, H, and I. Alternatives B and D could allocate up to 41 percent of the area to timber harvest and road building. All alternatives except Alternative E could allocate up to 19 percent of the area to domestic livestock grazing. The environmental effects of timber harvest, road building, and domestic livestock grazing on soil and water are discussed in Chapter IV - Soil and Water sections.

The risk of degrading the soil and water resource increases with more timber harvest and road building. Alternatives A/NFMA, B, C, D, F, G, H, and I pose more risk of degrading the soil and water resource than Alternative E due to more intensive management. However, since Wenatchee National Forest Best Management Practices and Forest Plan Standards and Guidelines will be employed, no unique soil and water effects are expected to occur because of forest management in this area.

b. Mitigation Measures

The mitigation measures that will be used in this area are the same as those discussed in Chapter IV - Soil and Water sections.

9. Air

There will be little additional prescribed burning generated in the Chelan roadless area as a result of the alternatives. There would not be significant effects on air quality beyond those effects discussed in Chapter IV.

10. Minerals

As the previous discussion indicates, the area is encumbered by nine lode claims and three placer claims, and the western portion of the area is considered to have a moderate potential for the occurrence of copper, zinc, gold, and silver and a low potential for the occurrence of nickel, cobalt, chromium, and platinum group metals. A small portion of the area is classified prospectively valuable for geothermal resources as well. However, since none of the alternatives call for withdrawing any part of the area from mineral entry, the consequences on mineral resources do not appear to be extremely significant nor do they vary appreciably by alternative. The management prescriptions under which the area would be managed in each alternative would restrict mineral activities to varying degrees (i.e., special stipulations in leases and in approved operating plans). The effects of these restrictions cannot be quantified, but the negative influence they would have on interest in conducting exploration activities within the area does vary by alternative and will, therefore, affect the potential for discovering and/or developing any known mineral resources of the area. The relative variation between alternatives is depicted on the following table.

Consequences on Mineral Resources

Restrictive Nature of Management Prescriptions	Acres Restricted by Management Prescriptions Alternative									
	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
Withdrawn from Mineral Entry (valid existing rights will be determined and recognized)	0	0	0	0	0	0	0	0	0	0
Highly Restrictive	62,730	45,050	60,314	45,050	64,067	62,098	59,086	62,730	60,314	16,577
Moderately Restrictive	6,806	19,611	7,145	19,611	6,996	7,905	10,917	6,806	7,145	35,723
Relatively Few Restrictions	1,527	6,402	3,604	6,402	0	1,060	1,060	1,527	3,604	18,763

11. ROADS

miles of local roads shown below for each alternative are those that are expected to be constructed to permit timber harvest. They are included in the totals for the various alternatives shown in Chapter IV of the FEIS. It is assumed that the bulk of these roads will be constructed within the next 20 years. An analysis of the road development in unroaded areas during the past ten years indicates that for every acre harvested approximately 5.5 acres are accessed. It is assumed that 50 percent of these roads will be closed to public traffic, and that the remainder will be suitable for travel by high clearance vehicles only.

These mileages are estimates based upon typical road densities necessary to harvest timber on different slope classes. The actual road miles that will result from the implementation of the various alternatives will be determined during project planning, design, and environmental analysis. The assumptions made for this analysis will be monitored. The construction of any road will be subject to the appropriate environmental analysis. That analysis will address the effects on resources that are dependent upon a roadless setting, including any adjacent roadless area or wilderness.

The decision to close any road will be made on a case by case basis, according to the Forest Road Closure Policy found in the Forest-wide Standards and Guidelines.

	<u>Alternative</u>									
	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
Miles	15	49	18	49	0	8	15	15	18	49

12. Fire

The fire management workload generated in the Chelan roadless area as a result of the alternatives will not have a significant effect beyond the effects already described in Chapter IV.

A slight increase in risk of non-motorized recreation related fires would occur from increased use in Alternatives E and F. There would also be an increase in risk of motorized recreation related fires in Alternatives B, C, D, G, I and J.

The cost efficiency of fire suppression activities would be slightly decreased due to slight increase in overall risk of fire in Alternatives B, C, D, E, F, G, I and J. Accessibility is not expected to change under any alternative requiring continued expensive aerial or boat use for initial attack on fires. The impacts generated by slash disposal activities are discussed in Chapter IV.

13. Social/Economic

To measure this area in terms of its social value, a basic assumption is being made. This is, that because of the expressed interest in keeping as much of the inventoried roadless areas as possible in an unroaded condition, the more that condition is reflected, the higher the social value.

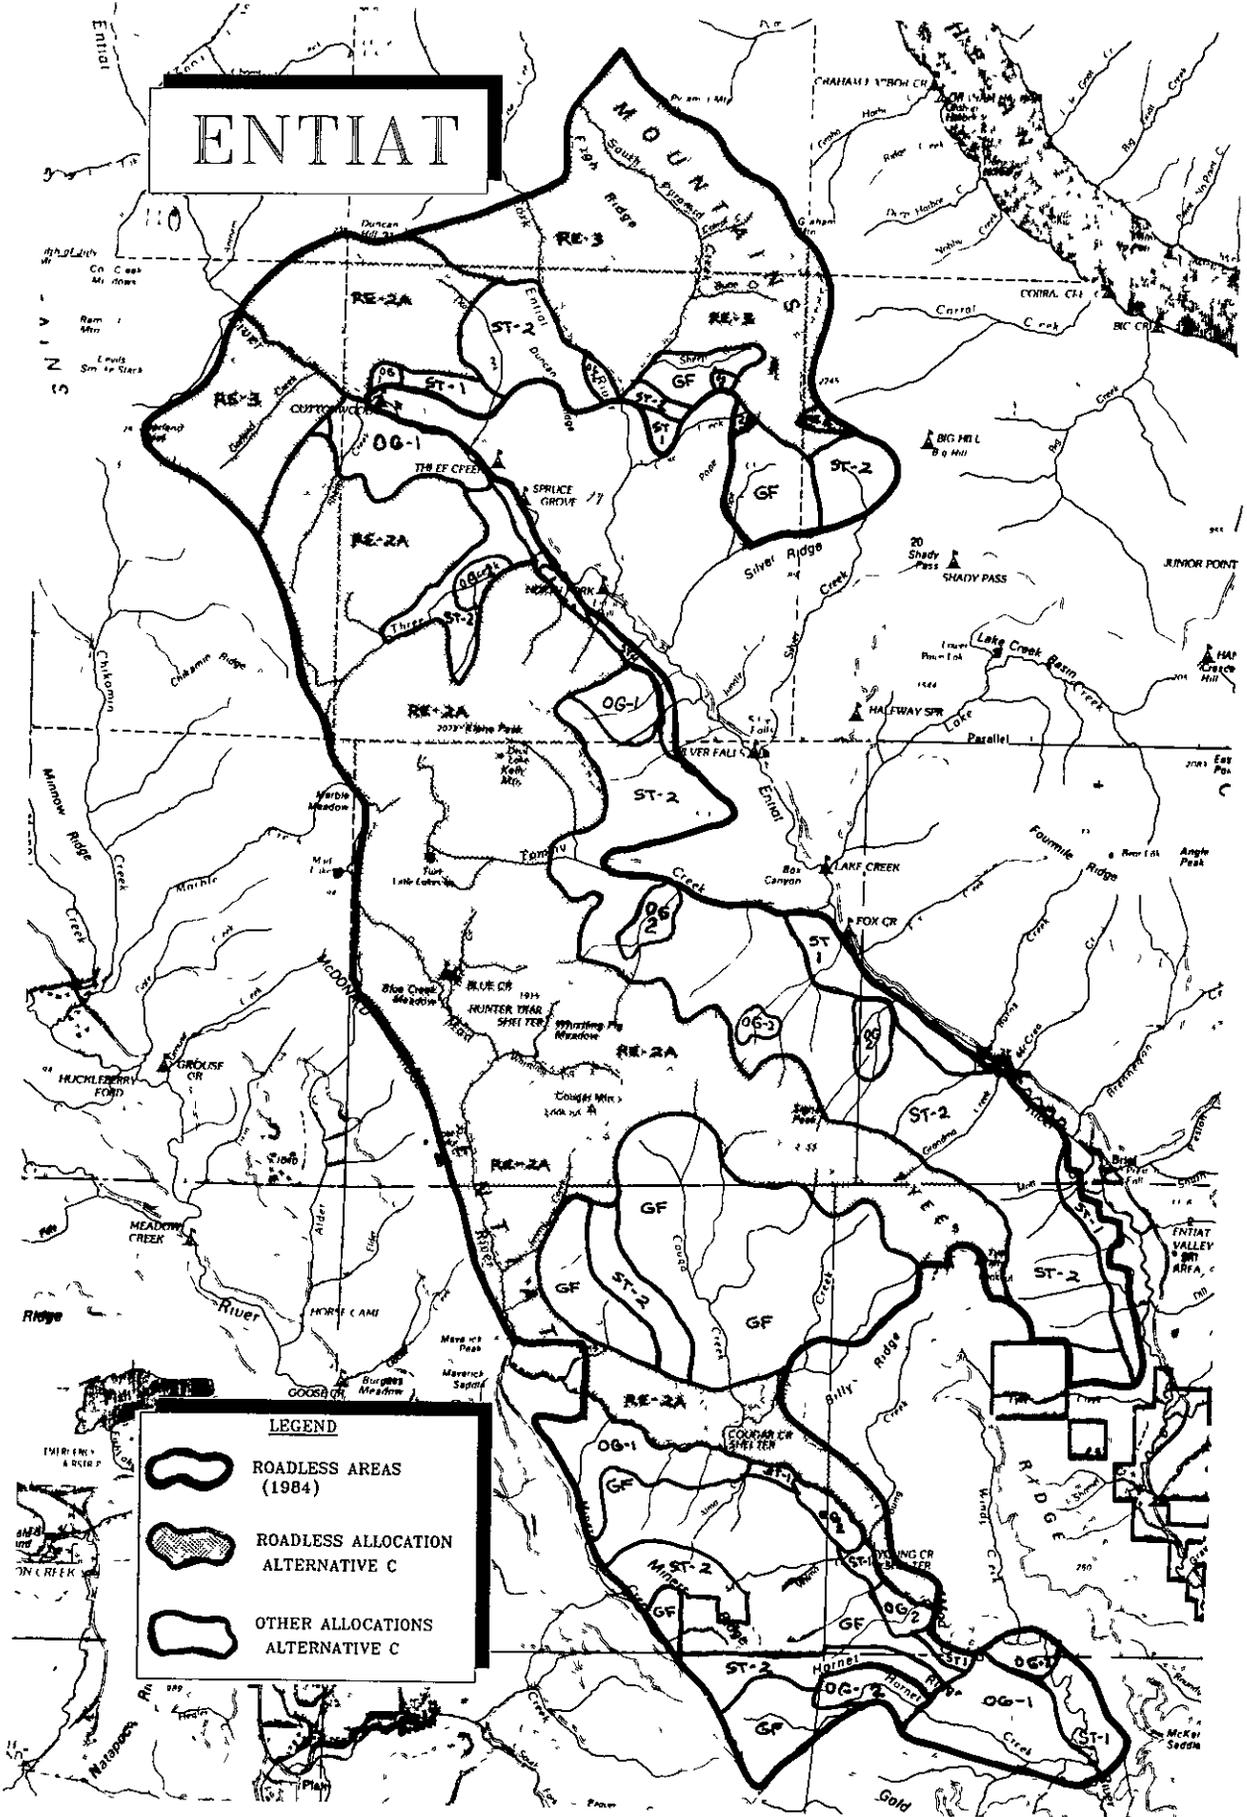

This condition is reflected for each alternative in the summary chart under item 1, Recreation, at the beginning of this section (Section V), which indicates the acres of unroaded management.

Also, as there is varying opinion as to the mode of transportation allowed, individuals must judge for themselves which alternative best meets that aspect of the social setting. There is also a summary table reflecting this condition for each alternative as referenced above which indicates the amount of motorized versus non-motorized use within the unroaded allocation.

A general measure of timber oriented economic impacts can be made using the same table referenced above showing the amount of unroaded allocation. The larger the unroaded area, the greater the impact on timber oriented jobs. If all of the estimated long-term sustained yield per year for this area were available, it would support 90.7 jobs.

14. Wilderness Potential

The roadless area has high potential for wilderness classification, either as an individual wilderness or as additions to existing wilderness. Alternatives B, D, and J allocate the least (59 percent of the area) to unroaded allocations and would result in the greatest change in the roadless area. Alternative J would be the most impacting with 17,707 acres in the General Forest allocation. Alternatives E, F, G, A/NFMA, and H provide the least impacting allocation on the wilderness character with 87 to 100 percent of the area in unroaded condition. Alternatives C and I provide a balanced resource allocation with 2,714 acres or 4 percent of the area allocated to General Forest.

ENTIAT ROADLESS AREA

Size: Gross Acres: 72,526

Net Acres: 71,254

I. GENERAL INFORMATION

A. History

Portions of this area have been allocated to dispersed roadless recreation through the Multiple Use Plan and Unit Plans. These were the Borealis area, Upper Entiat and Mad Lake Roadless Areas. Additional roadless area was inventoried by the Forest in the fall of 1983.

None of the area as currently mapped was involved in the RARE II study as it was addressed under the Chelan Unit Plan or was evaluated or selected as wilderness during the Washington State Wilderness Act of 1984 development.

B. Location and Access

The area lies adjacent to three of the other inventoried roadless areas in Chelan County on the Entiat Ranger District.

It is accessed by the Entiat Valley, North Fork Entiat, Tye Ridge, and Summit Ridge Roads, and the Entiat, North Fork Entiat, Pyramid Mountain, and Mad River Trails.

C. Physiography and Soils

This is a very large area, most of which is a plateau that has rolling gentle slopes. The part of this area that lies along the southwestern side of the Entiat River is distinct because it has cliffs of large angular granitic rock, below which are extensive talus slopes. There are some large meadows on the top of the plateau.

Elevations range from 4,400 to 8,200 feet. About 66 percent of the soils have formed in deposits (depths vary from as little as 6 inches to more than 30 feet) of volcanic ash and pumice, and the rest have formed in granitic materials. Ash soils are easily displaced once the protective surface vegetation has been removed. These soils are also very dusty when dry. The granitic soils on the other hand have excellent traffic bearing characteristics, they are not as dusty as the ash soils. Neither soil is sticky or slippery when wet.

D. Climate

Annual precipitation ranges from approximately 35 inches easterly within the area to over 50 inches to the west. An estimated 60-65 percent of the annual moisture falls as snow. Snow depths vary from a mean of 93 inches at the Pugh Ridge Aerial Marker site to a mean of 83 inches at the Tommy Creek Aerial Marker site. Valley sites experience an estimated mean snow depth of 60 inches annually.

E. Vegetation

Fifty-seven percent of this area is tentatively suitable timberland. Some 4,452 acres of this is in trees originating after the Hornet Creek fire of 1966 and the Gold Ridge and Tommy Creek fires in 1970. The Hornet Creek burn is well stocked with aerial seeded, planted, and natural origin trees.

Stocking in the Tommy Creek fire area is very dense lodgepole and Douglas-fir, much of which is in need of precommercial thinning. The Gold Ridge area is more sporadically stocked and still has some reforestation needs.

There are 9,455 acres classified as dry ecotype and most of this has been burned over, leaving only 16 percent in mature forest. The wet ecotype acres include 15,031 or almost 50 percent mature timber. Much of this is small diameter alpine fir-lodgepole pine type. Wet meadows and small lakes, including Mad Lake and Two Little Lakes, are included in this area.

Mad Lake area was included as unregulated area in the 1963 Timber Management Plan.

F. Current Uses

The Entiat roadless area is being managed as open to trail bike use. The Mad Lakes Management Unit, which comprises about one-third of this roadless area, is a very popular ORV area and receives heavy trail bike use.

The current use is for dispersed recreation. The major activities and their estimated annual use are as follows:

Activity	Estimated Annual Recreation Visitor Days
Motorized Trail Bike	1,600
Hunting	1,500
Hiking	1,200
Horseback Riding	400
Fishing	700
Total	5,400

The area contains the following kinds and amounts of Recreation Opportunity Spectrum (ROS) classes:

ROS Class	Acres
Semi-Primitive Non-Motorized (SPNM)	20,734
Semi-Primitive Motorized (SPM)	50,520

There are 159.3 miles of trail within the area and there are 121.8 miles currently open to motorized use.

G. Appearance and Surroundings

The area has high visual variety of landform and moderate to high variety in vegetation, rockforms, and waterforms (streams). There are few lakes within the area.

The area is essentially a steep and dissected glaciated valley with evenly textured north and northeast sideslopes. It has dense vegetation along stream bottoms and open, steep, rugged ridgetops. Some of the area has south facing basins with creeks in the bottom and a variety of evenly textured vegetation.

The area is primarily viewed as foreground from internal trails; as foreground and middleground from the Entiat Valley Road; and both foreground and middleground from the Chelan and Entiat Mountain ridgetop trails.

The Entiat area is surrounded by the Entiat Mountains, the Entiat River valley, and the Chelan Mountains.

H. Attractions

Attracting features are numerous meadows such as Cougar, Blue, and Marble, as well as the Mad Lake area including Mad, Ann, and Louise Lakes. Other attractions are the upper Entiat River, which is a main portal route into the Glacier Peak Wilderness, and the scenic Mad River corridor.

II. CAPABILITY-WILDERNESS CHARACTERISTICS

A. Manageability and Boundaries

The Entiat roadless area of the Wenatchee National Forest is that area of the Entiat District from the summit of the Entiat Mountain Range on its west to the west side of the Entiat River with exclusions for the Tommy Creek Road and private land in the valley bottom. The northern boundary is the southern edge of the Myrtle roadless area. A portion of the Entiat roadless area on the northeast side extends across the Entiat and North Fork Entiat River valleys to an eastern boundary along the summit of the Chelan Mountains. The southern line of this segment extends from one half-mile west of Big Hill, southwesterly along Silver Ridge to the Pope Ridge Road, then contouring in a northwesterly direction to the confluence of the North Fork Entiat River and Pyramid Creek. From that point the boundary goes in a westerly direction to the west side of the Entiat Valley, just above the road end near Cottonwood Campground. The southern boundary extends from the west side of the Entiat Valley, just north of Tyee Creek to Tyee Mountain, down Billy Creek and Billy Ridge to Young Creek. From Young Creek the line contours the northeast side of Mad River down to a point just south of the confluence of Hornet Creek and Mad River. From there the boundary runs to the summit of the Entiat Mountains on the south side of Hornet Creek.

The west boundary, from Marble Meadow south to McDonald Ridge should include Mad Lake, which is east of the summit of the Entiat Mountain range, and not follow the ridge line as it does now. The west boundary should also include Lost Lake since the trail access is from the Mad River side.

B. Natural Integrity

The impact of past human activity in this area is quite evident in the form of an extensive, existing trail system throughout the area and 2 cabins, 3 shelters, and 4 old lookout sites with foundations remaining. *Almost all of the trails are now open to, and have a long history of, trail bike use. One of the cabins is a Forest Service Guard Station. It is a log structure on concrete footings with a 30 foot radio antenna outside the cabin.*

C. Natural Appearance

The Entiat roadless area is large enough, and the topography and vegetation are such, that persons visiting the area have the opportunity to seek out drainages and areas that appear natural, away from ordinary human activity and development. It is, however, possible to observe distant roads, timber harvest activities, fire lookouts, farms and houses from the main ridges of the Entiat and Chelan Mountains as well as Tyee and Duncan Ridges.

D. Opportunities for Solitude

The area offers many opportunities for solitude. The area is in a long irregular shape that is approximately 19 miles long and 7 to 8 miles wide at its widest with some 1 1/2 - 2 mile wide fingers. There are three principal drainages with the longest being the Mad River. The other two are small segments of the main Entiat and the North Fork of the Entiat Rivers. There are also several deeply dissected side drainages that are untrailed and offer opportunity for solitude.

E. Opportunities for Primitive Recreation

There are ample opportunities for primitive recreation experiences. Horseback riding, hiking, backpacking, and viewing outstanding scenery are all opportunities that are available to the visitor. There are also good fishing opportunities in the many lakes and streams. Big game hunting throughout the area is quite good.

F. Challenging Experiences

There are several peaks and rock bluffs or cliffs that offer challenge to rock climbers. There are trailless areas that offer challenges to the cross-country enthusiast. Winter survival and other wilderness challenges are also available in this area.

G. Special Wildlife Features

There have been sightings of peregrine falcon reported but no nesting sites have been located. No other threatened or endangered species have been located within the area. The extent of sensitive species use in the area is unknown. Spotted owls have been located in the Hornet Ridge area.

H. Historical and Scientific Study

There are no special or unique opportunities for outdoor education and scientific or historic study in the area which cannot already be found in the existing wilderness on the Forest.

III. RESOURCES AND POTENTIALS

A. Recreation

The area has potential value for unroaded types of recreation activities. Estimated carrying capacity by ROS class is as follows:

ROS Class	Capacity in Potential Recreation Visitor Days Per Year
Semi-primitive Non-motorized (SPNM)	20,700
Semi-primitive Motorized (SPM)	151,500
Total	172,200

B. Wildlife

The area serves as summer habitat for a large mule deer herd and provides habitat for a variety of game and non-game species of birds and animals including black bear, martin, and grouse. Some small elk herds also use the area in the summer. There are several mountain goat herds that use the ridge area between Big Hill and Pyramid Peak.

C. Fish

This roadless area contains portions of many streams, and in some cases, entire streams. The stream systems will be listed in a counter-clockwise direction beginning in the northern portion of the area.

South Pyramid Creek is a relatively small, infertile stream known to have a small population of rainbow trout. In addition there are probably cutthroat trout in some reaches and there have been reports of Eastern brook trout and bull trout.

The North Fork of the Entiat also is a relatively infertile, high gradient stream, although the production would be expected to be slightly higher than South Pyramid Creek. The same species mix as for South Pyramid Creek should be expected. There is some fishing pressure on the stream due to a trail paralleling the stream along its entire length.

Duncan Creek has no known fish population.

The Entiat River is heavily fished along its entire length within this roadless area. It is stocked just below the roadless area and there is essentially a "put and take" fishery. The Entiat has populations of both native rainbow and cutthroat trout.

Tommy Creek is the next fish stream. From the Entiat River to Two Little Lakes there are populations of mostly cutthroat trout. Production is thought to be good, although the stream is not heavily fished. There may also be Eastern brook trout and bull trout in the stream.

Along the south side of the Entiat, there are numerous small streams that enter between Tommy Creek and the Mad River. None of these are known to have any fish production.

The Mad River has reaches that appear to have fairly high fisheries production, as compared to other eastern Cascade systems. This may be due to the river originating below the Cascade's crest. Generally, rainbow trout are found below Young Creek and cutthroat trout above Young Creek. The upper reaches of the Mad River appear to have the highest production of fish. There is also use of the Mad River by anadromous fish. Steelhead probably use the river upstream to at least Almà Creek. There is also the potential for spring chinook salmon use in the same reach. Of the tributaries to the Mad River, Young, Cougar, and Billy Creeks have some resident fish use (cutthroat) in their lower reaches. Hornet Creek is a small creek, and the presence of fish is not known. Whistling Pig and Blue Creek are also very small tributaries that have some resident fish use.

D. Water

There are currently two snow survey aerial marker sites in the area. There is a powersite withdrawal Power Site Classification (PSC) #40 located in portions of Sections 33 and 34, T28N, R19E, and Sections 3 and 10, T27N, R19E WM. There is also a proposed reservoir or impoundment authorized under Power Site Reservoir (PSR) 755. The location of the site would inundate portions of Sections 3 and 10 of the township and range stated above.

Water yield information relevant to potential runoff snow survey sites and a stream discharge measurement station (immediately outside the roadless area), also exist. The only active stream gaging station in the Entiat drainage is maintained by the U.S. Geological Survey at the mouth of Stormy Creek on the main Entiat River.

E. Livestock

This is a large roadless area with varying degrees of potential for livestock grazing. The area currently contains existing, or portions of existing, recreation stock allotments.

The North Fork Entiat River and Pyramid Creeks are part of the Pyramid Creek Recreation Stock Allotment. There is some potential for domestic stock particularly if adjacent roaded areas in Pope and Crow Creeks were combined with the portion in this roadless area. The potential would be further enhanced with access and transitory range in Butte and Sleep Creeks.

The upper Mad River portion of the area, in the vicinity of Blue Creek, is currently inventoried as the Mad Lake Recreation Stock Allotment. This portion is used through the summer and fall by recreation stock, but no commercial use has occurred here in the past 10 years. There may be some potential for a domestic stock allotment.

An area between Billy Ridge and Cougar Creek has moderate topography, and may have some potential for domestic stock with improved access and creation of transitory range.

The remainder of the area including the main Entiat River and lower Mad River drainages have little if any potential for stock allotments due to a combination of topography, vegetative types, and access.

F. Timber

The area contains 40,450 acres of tentatively suitable timberland. Stand, volume, and other data are as follows:

Ecotype	Stand Size	Acres	Estimated Standing Volume (MMBF)	(MMCF)
Wet	Mature	15,031	426.0	78.2
Wet	Immature	15,455	260.0	47.7
Wet	Seedling-Sapling	509	---	---
Dry	Mature	1,526	19.1	3.5
Dry	Immature	4,219	41.4	7.6
Dry	Seedling-Sapling	3,710	---	---
	Total	40,450	746.5	137.0

The estimated maximum biological potential contribution to the long-term sustained yield is 13.0 MMBF (2.4 MMCF) per year.

G. Minerals

Available references indicate that the northeast and southern parts of the area are overlaid by pre-upper Jurassic metamorphic rocks, while the remainder is primarily overlaid by Mesozoic granitic rocks. The area's mineral resources have not been studied in detail by either the U.S.G.S. or U.S. Bureau of Mines, but it is reported that the area has occurrences of gold (both placer and lode), platinum, kyanite, graphite, limestone, mica, pumice, and slate. None of these have been adequately investigated to determine whether the deposits are of commercial value. According to the Bureau of Land Management records (1/23/85), the area has had no mining claims located within it. The area is not classified "prospectively valuable" for any of the leasable commodities, and it has no existing leases nor any pending lease applications.

H. Cultural-Historical

A portion of the Entiat unit (Tyee Mountain and Mad River country) was reportedly used by the Entiat Indians for travel, hunting, and food gathering. No prehistoric sites are known within this unit, but cultural resource survey of the area has been minimal.

Historically, the unit received intensive use by sheep grazing, and sites related to this use are likely. Administration of the area by the Forest Service for fire protection and recreational use is evident in the unit with the old lookout sites on Tyee Mountain (1931-1950's), Klone Peak (1931-1960's), and Cougar Mountain (1921-1969), and the shelter at Blue Creek. Evidence of former traplines might also be expected in this area.

I. Land Uses

There are no special land uses within the area.

J. Fire

Annual fire occurrence is moderate with most fires started by lightning. Fuel loadings range from heavy accumulations of down fuels at lower elevations to scattered alpine timber and meadows at higher elevation. Periodic large fires have occurred.

K. Insects and Disease

Severe defoliation by the spruce budworm occurred in the Mad River area in the 1970's. Since aerial spray treatment in 1977, no outbreaks have been detected.

Mature lodgepole stands subject to mountain pine beetle are the major insect potential problem in this area. Access to these lodgepole stands in Billy Basin is planned to prevent major insect damage.

Scattered, heavily mistletoed trees are being treated to prevent the new stands developing after the 1970 fires from becoming infected. Special insect and disease funds have been requested to complete this work. Both regional and national insect and disease specialists visited this area in 1984 to review needs and completed projects. This area is top priority in the region for mistletoe control due to the high benefit to cost ratio for work here.

L. Private Lands

There are 1,272 acres of private land within the area. Section 16 of T27N, R18E, is State of Washington land and Section 36 and portions of 35, T27N, R18E, are owned by the City of Seattle. Both are accessed by foot only.

Possibilities for acquisition are considered excellent for the state lands and good for the Seattle property.

IV. NEED

A. Nearby Wilderness and Other Roadless Areas

This area is located within 10 miles of the 576,865 Glacier Peak Wilderness Area and is adjacent to the Myrtle Lake, Rock Creek, and Chelan-Sawtooth roadless areas.

B. Distance From Population Centers

The area is within two to four hours driving time from population centers such as Seattle-Tacoma, Yakima, Tri-Cities and Wenatchee.

C. Need For Ecosystem Representation

There are no special or unique ecosystems within the area which need representation through wilderness classification.

D. Interest By Proponents, Including Congressional

Since the passage of the Washington State Wilderness Act of 1984, Congress has not expressed interest in making further additions to the State wilderness system. Environmental organizations have expressed interest in adding portions of the area to the National Wilderness Preservation System in the future.

Both environmental and ORV organizations and users have advocated maintaining roadless status for the area.

E. Public Input

Public input during the unit planning efforts was obtained and supported unroaded allocations.

F. Other Public Involvement

Public input solicited during the formulation of alternatives for this plan indicated much support for dispersed, unroaded recreation use for the area.

Opinions differ as to the allocation being for motorized or non-motorized use.

V. ENVIRONMENTAL CONSEQUENCES

A. Environmental Consequences Associated with the Alternatives

1. Recreation

a. Significant Effects

The Entiat roadless area consists of 71,254 acres. Alternatives A/NFMA and H allocations depict the current land management direction. If either of these alternatives were selected, there would be no significant change from the present situation. Trails and recreation sites that exist in General Forest and timber management allocations would be protected or replaced during harvest activities. Approximately 25 percent of the area is in General Forest allocation in Alternative A/NFMA. Allocation of unroaded areas emphasize non-motorized recreation.

Alternatives B, D and J would allocate 49 percent of this roadless area for General Forest. While existing trails and recreation sites would be protected, there would be a significant loss of roadless characteristics and roadless recreation opportunities.

Alternatives C and I would have 18 percent of the area allocated to General Forest. Recreation improvements and trails would be protected during harvest activities.

Under Alternative C and I the portion of the trail system in this roadless area is allocated as follows:

<u>Trail Name</u>	<u>Trail Number</u>	<u>Unroaded Non-Motorized</u>	<u>Unroaded Motorized</u>	<u>Roaded Motorized</u>
Entiat River	1400	--	--	4.2
Cow Creek Meadows	1404	1.0	--	--
Myrtle Lake Campground	1404.2	--	0.4	--
Mad River (Lower)	1409	--	5.0	9.9
Hornet Ridge	1410	--	--	6.0
Miners Ridge	1411	--	--	4.5
Tyee Ridge	1415	--	8.7	--
Billy Creek	1416	--	0.5	4.7
Hunter	1417	--	1.2	--
Cougar Ridge	1418	--	2.0	4.5
Jimmy Creek	1419	--	2.4	0.5
Cougar Mtn. VP	1419.1	--	0.4	--
Cougar Mtn.	1420	--	2.3	--
Lost Lake	1421	--	3.9	--
Mott Creek	1422	--	0.3	1.0
S. Tommy	1423	--	1.0	4.7
Middle Tommy	1424	--	2.0	6.8
N. Tommy	1425	--	4.5	4.5
Blue Creek	1426	--	4.8	--
Klone Peak	1427.1	--	0.5	--
Shetipo	1429	--	2.7	2.0
Pyramid Mtn.	1433	6.3	--	--
Pyramid Mtn	1433.1	1.2	--	--
Pyramid Mtn.	1433.2	7.1	--	--
Duncan Hill	1434	--	--	10.4
Duncan Hill VP	1434.2	--	--	0.5
Anthem Creek	1435	--	--	3.3
Fern Lake	1436	1.5	--	--
N.Fk Entiat River	1437	6.6	--	1.5
Pugh Ridge	1438	4.9	--	--
Pyramid Creek	1439	4.0	--	--
Butte Creek	1440	2.0	--	--
Pyramid View Point	1441	2.9	--	--
Mad River (Upper)	1409.1	--	10.2	--
Totals		37.5	52.8	69.0

Alternative E would allocate the whole roadless area to Unroaded Dispersed Recreation with some trails open for motor bike use.

Alternative F would allocate almost all of the area to Dispersed Recreation, Non-motorized, thus removing all of the trails in this area from motorized use. This would mean a loss of 133 miles of motorized trail opportunities. Only four percent of this roadless area would be allocated to General Forest and would have no significant effect on the recreation.

Alternative G would allocate almost the same areas as Alternative F, but to Dispersed Recreation, Motorized with 133 miles of trails open to motorbikes. Four percent of the area would be allocated to General Forest.

b. Summary

The following tables indicate, by alternative, the degree to which this area will be allocated to roadless management and, of the roadless management acres, what percent is motorized and non-motorized. These represent the Semi-primitive Motorized and Semi-primitive Non-Motorized Recreation Opportunity Spectrum (ROS) Classes. The area being allocated to roaded types of management activities will become Roaded Natural or Roaded Modified ROS opportunities depending on the intensity of development.

Percent of the Area Having Unroaded Allocation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	27	36	51	36	100	90	94	27	51	36

Percent of the Unroaded Allocation Area
In Terms of Motorized/Non-Motorized Recreation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	91/90	95/5	72/28	95/5	17/83	15/85	97/3	99/1	72/28	95/5

The area being allocated to roaded management activities will have increased dispersed roaded recreation opportunities and the possible opening of access to potential developed recreation sites. The trail miles within the area allocated to roading may provide a less semi-primitive recreation experience with a more roaded natural or roaded modified setting.

2. Wild, Scenic, and Recreational Rivers

A portion of the following river corridors (one-quarter mile each side of the river) is being located within this roadless area and is recommended for designation in Alternatives C and I:

<u>River</u>	<u>Recommended Classification</u>	
Entiat	Segment 2	Scenic
	Segment 3	Recreational

More information concerning this recommendation can be found in Chapter III and Chapter IV.

3. Cultural Resources

Consideration of cultural resource values are required by a special set of historic preservation laws, regulations and policies. Particular efforts will be made in every alternative to inventory, evaluate, and provide for significant cultural resources in areas where Forest management activities are planned.

4. Scenery

Alternatives A/NFMA and H will allocate the upper end of the valley, North Fork Basin trail foreground, and the Mad River trail foreground to Retention VQO. The middleground of the North Fork Basin and the Entiat Valley viewsheds will be allocated to Partial Retention VQO. The Cougar Creek Basin and the Clone Peak trail and its surrounding areas will be allocated to General Forest, or Maximum Modification VQO.

Alternatives B, D and J will allocate almost one-half of the area to Maximum Modification VQO. These areas include the lower three-quarters of the drainage in the North Fork Entiat River, South Pyramid Creek, to Corral Creek; the lower mid-slopes of the creek bottoms of the Entiat viewshed, and the entire Cougar Creek basin. The upper ridges of Tyee and Entiat Mountains will be allocated to Retention VQO. Most ORV trails will have heavily altered recreational settings.

Alternatives C and I will allocate many areas to protect the scenic values of the area. Many viewsheds will have high visual quality except the Cougar Creek basin and the Hornet Creek area. The upper ridgetops of the planning area will be allocated to Retention VQO.

Alternative E will allocate all areas to Retention VQO. There is no General Forest allocation in this alternative.

Alternative F will allocate most areas to Retention VQO. The Upper Entiat, North Fork of the Entiat, and the Mad River will be allocated to Wild River or Retention VQO. Some areas will be Maximum Modification VQO.

Alternative G will allocate most areas to Dispersed Recreation Unroaded-Motorized or Retention VQO. Some areas will be Partial Retention and Maximum Modification VQO.

The following table summarizes the Scenic component of this area by alternative in acres of Visual Quality Objective (VQO).

VQO	A/NFMA	B	C	Alternative		F	G	H	I	J
				D	E					
Preservation	--	--	--	--	--	--	--	--	--	--
Retention	28,960	32,945	44,309	32,945	71,254	67,184	67,714	28,960	44,309	32,138
Partial Retention	25,842	4,601	15,641	4,601	--	1,547	1,187	25,842	15,645	5,026
Modification	276	21	21	21	--	--	--	276	21	21
Maximum Modification	16,176	33,687	11,279	33,687	--	2,523	2,353	16,176	11,279	34,069
Total Acres	71,254	71,254	71,254	71,254	71,254	71,254	71,254	71,254	71,254	71,254

Preservation indicates that only natural, ecological changes will occur.

Retention indicates an essentially natural appearing landscape will be present.

Partial Retention indicates the landscape will be slightly altered.

Modification indicates a moderately altered landscape will be present.

Maximum Modification indicates a heavily altered landscape may be present.

5. Wildlife

Alternatives A/NFMA and H would road 73 percent of the area and allow timber emphasis harvest on 23 percent of the area, compared to B, D and J which would road 64 percent and timber emphasis on 49 percent. Therefore, Alternatives A/NFMA and H would have one-half the impact of B and D on wildlife habitat. Alternatives C and I would road 56 percent of the area and allow timber emphasis on 18 percent of the area. Alternatives C and I would have less impact than A/NFMA and H, but more than E, F, and G. Alternative E would have insignificant effect on wildlife habitat in this area. Alternatives F and G would have more impact than E, but considerably less than C; G would have somewhat more impact than F due to the development of more ORV use.

6. Fisheries

a. Significant Effects

In Alternative E, all areas would remain roadless; in Alternative F all areas would be either roadless or in the Wild, Scenic, or Recreational river category; and in Alternative G all areas affecting fish would be roadless except the upper three miles of the Billy Creek drainage which could be managed under an intensive timber harvest prescription. In all these alternatives, the existing fishery conditions are expected to remain essentially unchanged.

In the other alternatives the stream areas would be managed in a variety of different ways. The table on the next page depicts these management prescriptions for the stream areas shown.

Roading these areas could change the recreational fishing opportunities. Since about two-thirds of the Forest's fishing occurs in roaded areas, it is expected that fishing would increase. This would help to meet a portion of the fishing demand (see Chapter III on Fish), but also could result in overfishing and

reduction in both numbers and size of fish using the habitat. However, since the wild fisheries production is thought to be very low in many of these headwater-type stream systems, fishermen are unlikely to fish intensively in most areas and overfishing effects generally should not occur.

It is also possible that roading the unroaded areas could result in environmental degradation to streams due to timber harvest and road construction in the basins (see Chapter IV Environmental Consequences). Some of these possible effects are addressed in the soil and water environmental effects section. Overall, even if all areas would be roaded it is not expected that there would be any significant individual or cumulative effects on the resident and anadromous fish populations in the Entiat Drainage (see Mitigation Measures below).

b. Mitigation Measures

In the alternatives that could road presently unroaded areas, the riparian protection zone prescription, the Wenatchee National Forest's Best Management Practices, and all standards and guidelines common throughout riparian areas of the Forest would be applied in stream zones. This treatment should adequately protect the streams from a reduction in fish habitat capability.

If the areas are roaded, road closures could be implemented to reduce the impact of enhanced access on the native fish populations.

Table - Allocation of Management Prescriptions in the Entiat Roadless Area In Stream and River Areas for Alternatives A/NFMA, B, C, D, H, and I

Where "Int." is shown, this indicates that an intensive timber management prescription could dominate in that area. Where "Ext." is shown, this indicates that an extended shelterwood timber management prescription would dominate in that area and would be executed primarily to meet visual objectives. Where "Rdls." is shown, this indicates that the management prescription would be to maintain the area as roadless.

Stream/River	A/NFMA /H	Alternative B/D	C/I
South Pyramid	Lower 2 Miles: Ext. Upper: Rdls.	Lower 3 Miles: Int. Upper: Rdls.	Lower 3 Miles: Ext. Upper: Rdls.
North Fk. Entiat	Lower 2 Miles: Ext. Upper 2 Miles: Rdls	All Int.	Lower 2 Miles. Ext. Upper 2 Miles: Rdls
Entiat River	All Rdls.	All Int.	All Rdls
Tommy Creek	Lower 1/2: Int. Next 1: Ext. Upper: Rdls.	Lower 1 Mile: Int. Upper: Rdls.	Lower 1 Mile. Ext. Upper: Rdls.
Mad River	All those listed below are tributaries to the Mad River.		
Upper Mad	To Lost Lake: Ext. Upper: Rdls.	All Int.	All Rdls.
Lower Mad	All Ext.	All Int.	To Jimmy Ck: Ext.
Young Creek	All Ext.	All Int.	All Ext
Cougar Creek	All Int.	All Int.	All Int
Billy Creek	All Int.	All Int.	Lower 1 Mile: Ext Upper: Int.
Hornet Creek	All Int.	All Int.	All Int.
Whistling Pig	All Rdls.	All Int.	All Rdls
Blue Creek	All Rdls.	All Int.	All Rdls.

7a. Vegetation: Trees

Under all alternatives it is expected that more area will remain unroaded than is roaded. The range of tree management activities is from 34,069 acres (48 percent) scheduled for timber emphasis in Alternative J to no scheduled harvest in Alternative E.

Alternatives A/NFMA and H have 16,176 acres (23 percent) timber emphasis and an additional 32,118 acres of vegetation manipulation with other resource emphasis planned.

Alternatives C and I have identical acre allocations. Both have 11,279 acres of timber emphasis, or 16 percent of the area. An additional 21,349 acres would be managed for other resource values that permit vegetative manipulation through timber sales. The primary difference between Alternatives C and I is the rate of harvest. Under Alternative I, more harvest activity would be scheduled in the first decade.

Alternatives F and G allocate 2,353 to 2,523 acres to timber emphasis. They also anticipate vegetative manipulation through timber sales on 1,506 to 3,816 acres, or two to five percent of the area, for other resource objectives.

7b. Vegetation: Forage

There are existing allotments within this roadless area. However, the existing and potential forage base will make a significant contribution to the forage needed by big game and livestock from the fourth decade on. Due to the low incidence of natural fire and lack of livestock use over the past 10 to 50 years, many forage areas are stocked with trees or high brush and do not provide wildlife forage. With the proposed vegetative manipulation and access, Alternatives C, H, and I will contribute adequate forage for big game and livestock. Alternatives A/NFMA, B, D, and J will provide forage in excess of needs, while Alternatives E, F, and G will not meet forage needs for livestock in the fourth or fifth decades.

8. Soil and Water

a. Significant Effects

The environmental consequences of allocating the Entiat roadless area to General Forest or Roadless Management are discussed by alternative below. No significant soil and water consequences are associated with Alternative E because soil and water disturbing activities occurring would be minimal. Up to six percent of the area in Alternatives F and G could be allocated to timber harvest and road building so the soil and water consequences would be minimal. Alternatives A/NFMA, B, C, D, H, I and J could allocate up to 59 percent of the area to timber harvest and road building. The environmental effects of timber harvest and road building on soil and water are discussed in Chapter IV - Soil and Water sections.

The risk of degrading the soil and water resource increases with more timber harvest and road building. Alternatives A/NFMA, B, C, D, H, I, and J pose more risk than Alternatives E, F, and G due to more intensive management. However, since Wenatchee National Forest Best Management Practices and Forest Plan Standards and Guidelines will be employed, no unique soil and water effects are expected to occur because of forest management in this area.

b. Mitigation Measures

The mitigation measures that will be used in this area are the same as those discussed in Chapter IV - Soil and Water sections.

9. Air

The additional prescribed burning generated in the Entiat roadless area as a result of the alternatives would not have a significant effect on air quality beyond the impacts discussed in Chapter IV.

10. Minerals

Since this area appears to have a low potential for the occurrence of mineral resources of significant nature, the consequences on mineral resources do not appear to be extremely significant nor do they appear to vary appreciably by alternative. However, the management prescriptions under which the area would be managed in each alternative would restrict mineral activities to varying degrees (i.e., special stipulations in leases and in approved operating plans). For an example, a withdrawal precludes all mineral related activities except those authorized by prior existing rights; and a designation as a roadless non-motorized area, a developed recreation site, special area or as a Wild and Scenic river calls for the area to be managed under highly restrictive management prescriptions. The effects of these restrictions cannot be quantified. The negative influence they would have on interest in conducting exploration activities within the area does vary by alternative and will, therefore, affect the potential for discovering and/or developing any unknown mineral resources of the area. The relative variation between alternatives is depicted on the following table.

Consequences on Mineral Resources

Restrictive Nature of Management Prescriptions	Acres Restricted by Management Prescriptions									
	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
Withdrawn from Mineral Entry (valid existing rights will be determined and recognized)	0	0	0	0	0	0	0	0	0	0
Highly Restrictive	26,946	34,217	43,397	34,217	71,254	67,374	67,628	26,946	43,397	33,771
Moderately Restrictive	27,856	3,329	16,578	3,329	0	1,357	1,273	27,856	16,578	3,393
Relatively Few Restrictions	16,452	33,708	11,279	33,708	0	2,523	2,353	16,452	11,279	34,090

11. ROADS

The miles of local roads shown below for each alternative are those that are expected to be constructed to permit timber harvest. They are included in the totals for the various alternatives shown in Chapter IV of the FEIS. It is assumed that the bulk of these roads will be constructed within the next 20 years. An analysis of the road development in unroaded areas during the past ten years indicates that for every acre harvested approximately 5.5 acres are accessed. It is assumed that 50 percent of these roads will be closed to public traffic, and that the remainder will be suitable for travel by high clearance vehicles only.

These mileages are estimates based upon typical road densities necessary to harvest timber on different slope classes. The actual road miles that will result from the implementation of the various alternatives will be determined during project planning, design, and environmental analysis. The assumptions made for this analysis will be monitored. The construction of any road will be subject to the appropriate environmental analysis. That analysis will address the effects on resources that are dependent upon a roadless setting, including any adjacent roadless area or wilderness. The decision to close any road will be made on a case by case basis, according to the Forest Road Closure Policy found in the Forest-wide Standards and Guidelines.

	<u>Alternative</u>									
	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
Miles	148	126	114	126	0	10	15	148	114	126

12. Fire

The fire management workload generated in the Entiat roadless area, as a result of the alternatives, will not have a significant effect beyond the effects already described in Chapter IV.

A slight increase in risk of recreation related fires would occur in Alternatives E, F, and G. Additional road access due to increased timber harvest activity would also increase risk of fire in Alternatives A/NFMA, B, D, H and J.

The cost efficiency of fire suppression activities would be slightly increased in Alternatives A/NFMA, B, D, H and J as road access would allow more area to be covered by ground based suppression resources. Cost efficiency levels in Alternatives E, F, and G would be less due to slower initial attack by ground forces or the use of more expensive aerial delivered resources such as helitack or smokejumpers.

The impacts generated by slash disposal activities are discussed in Chapter IV.

13. Social/Economic

To measure this area in terms of its social value, a basic assumption is being made. This is, that because of the expressed interest in keeping as much of the inventoried roadless areas as possible in an unroaded condition, the more that condition is reflected, the higher the social value.

This condition is reflected for each alternative in the summary chart under item 1, Recreation, at the beginning of this section (Section V), which indicates the acres of unroaded management.

Also, as there is varying opinion as to the mode of transportation allowed, individuals must judge for themselves which alternative best meets that aspect of the social setting. There is also a summary table reflecting this condition for each alternative as referenced above which indicates the amount of motorized versus non-motorized use within the unroaded allocation.

A general measure of timber-oriented economic impacts can be made using the same table referenced above showing the amount of unroaded allocation. The larger the unroaded area, the greater the impact on timber-oriented jobs. If all of the estimated long-term sustained yield per year for this area were available, it would support 161.3 jobs.

14. Wilderness Potential

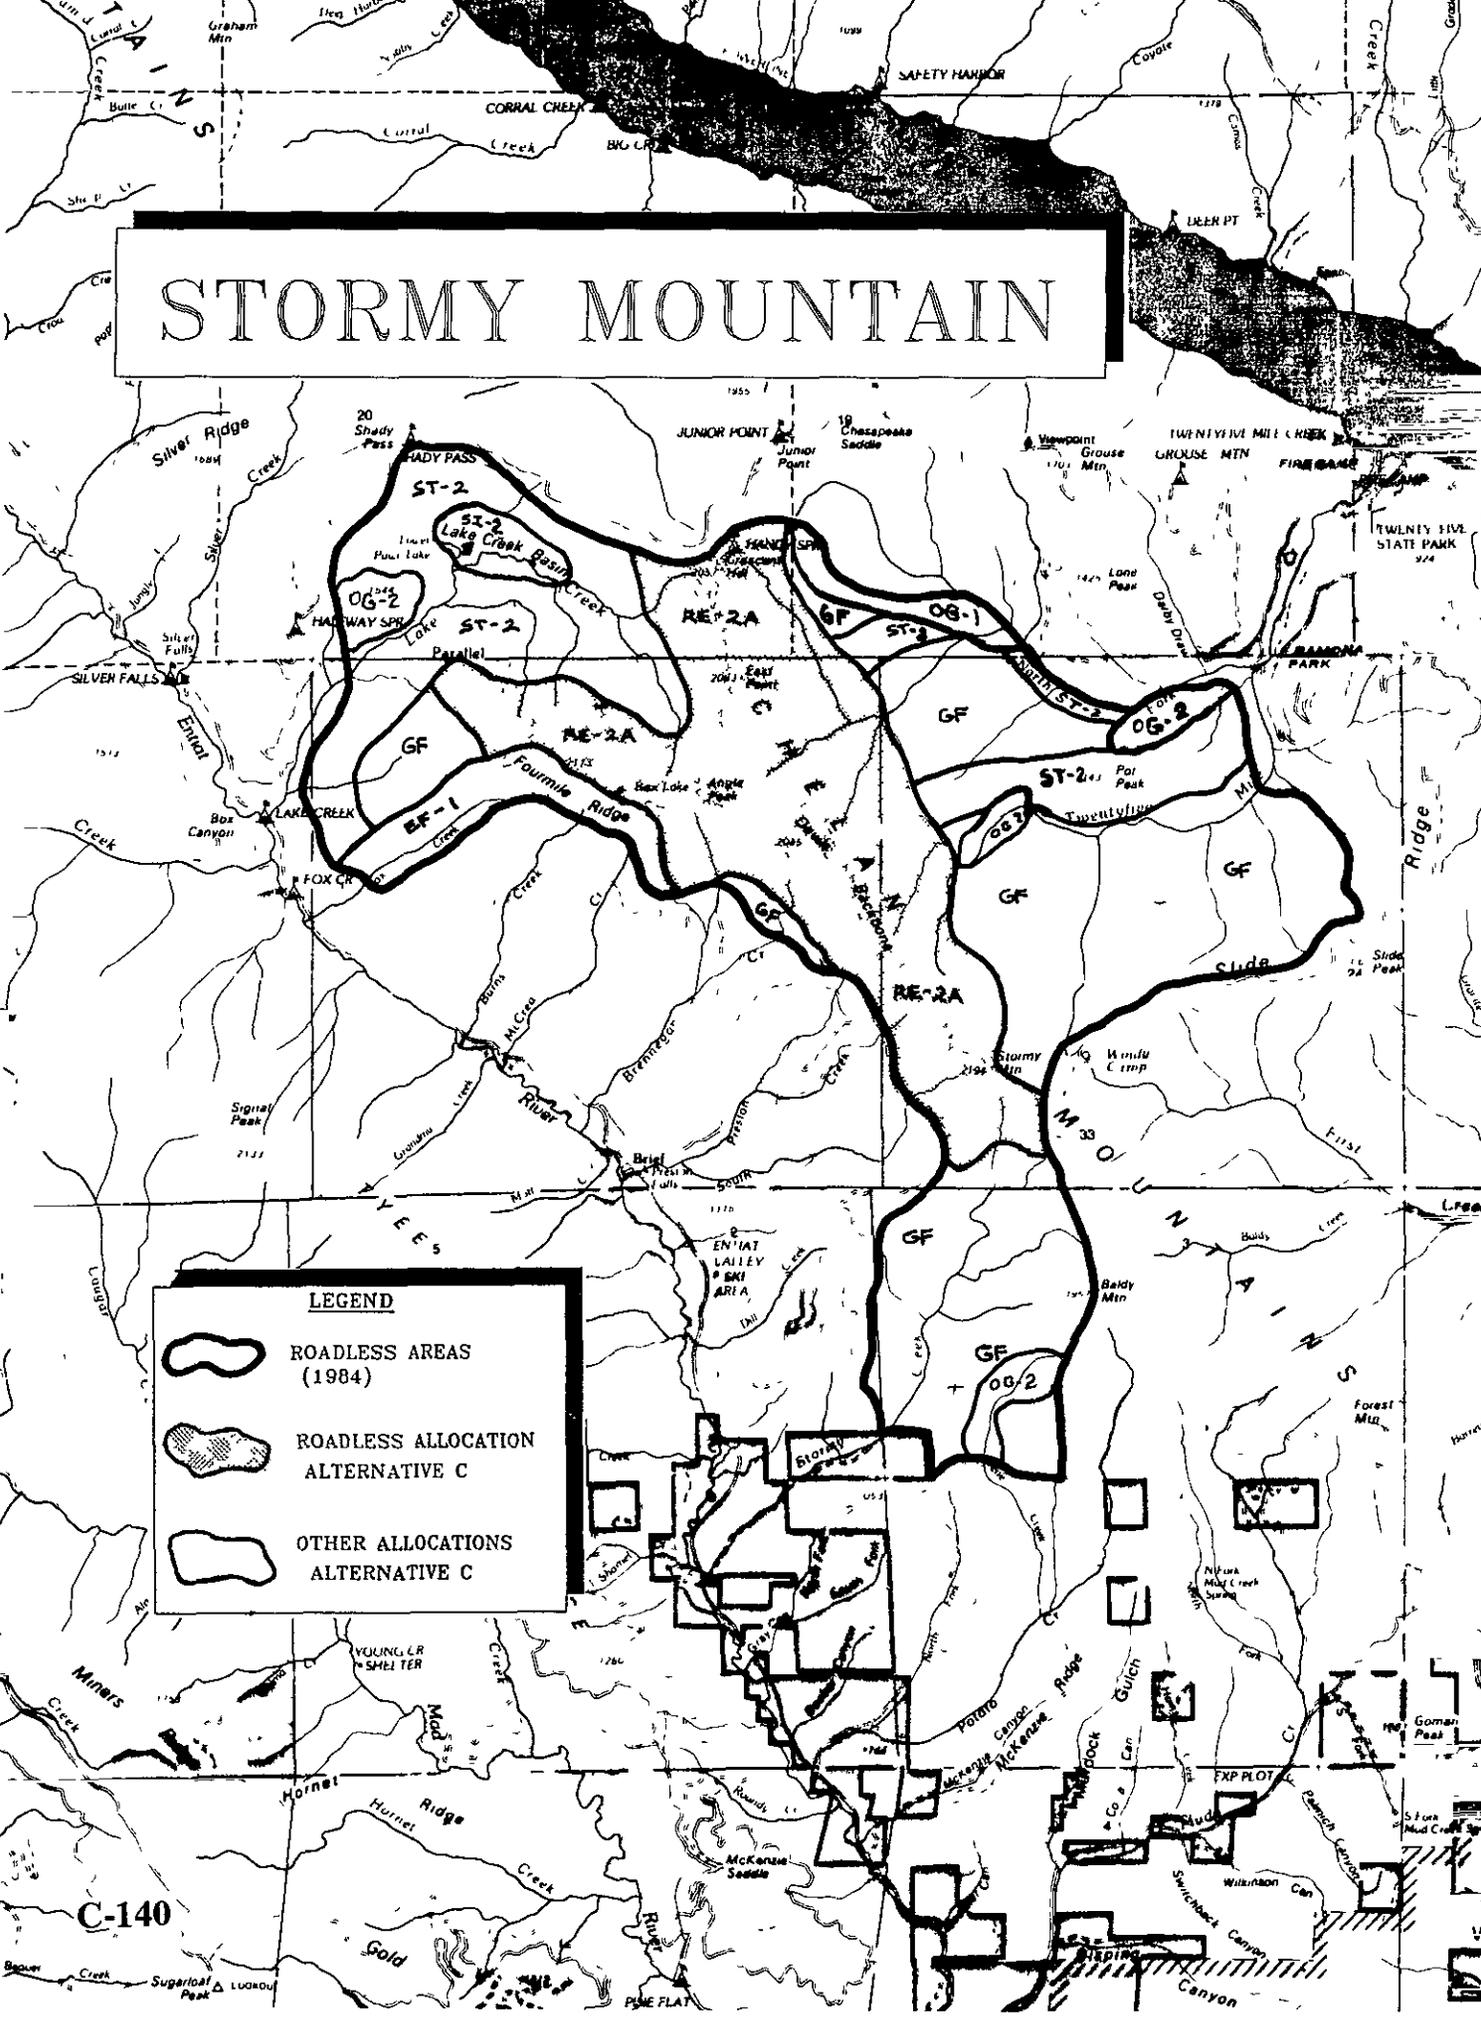

The roadless area has high potential for wilderness as an individual area or as addition to existing wilderness. Alternatives A/NFMA, H, B, D, and J provide the least retention of unroaded conditions. Alternatives B, D, and J propose the greatest allocation of General Forest at 33,687 acres or 47 percent of the area. Under these alternatives, the great modification or change from natural conditions would occur.

Alternatives E, F, and G would result in the least change with no, or very few, acres in General Forest. Alternatives C and I propose a blend of allocations with moderate change as General Forest is proposed on 11,363 acres.

STORMY MOUNTAIN

LEGEND

-  ROADLESS AREAS (1984)
-  ROADLESS ALLOCATION ALTERNATIVE C
-  OTHER ALLOCATIONS ALTERNATIVE C

STORMY ROADLESS AREA

Size: Gross Acres: 32,521

Net Acres: 32,500

I. GENERAL INFORMATION

A. History

The area was inventoried under RARE I but was not selected. In 1974 the area was allocated to sustained resource production under the Chelan Unit Plan. It was re-inventoried in 1983 and none of the area was allocated for wilderness under the Washington State Wilderness Act of 1984.

In 1970, under his authority, the Chief of the Forest Service established the Entiat Experimental Forest. Of this area, 1,632 acres lie within the boundaries of the Stormy roadless area. The experimental forest is dedicated to a variety of forest resource management activity-oriented research projects.

B. Location and Access

It is located near the south end of the South Holden portion of the Chelan-Sawtooth roadless area and east of the Entiat roadless area in Chelan County on both the Chelan and Entiat Ranger Districts. It is accessed by the Shady Pass and Stormy Mountain Roads and the Pot Peak, Devil's Backbone, Entiat, Lake Creek, and Four Mile Ridge Trails.

C. Physiography and Soils

This area is characterized by the rugged Devils Backbone ridge separating the Entiat River drainage from the Chelan drainage. The drainage basins on both sides of the ridge are well timbered and the topography suggests that they were formerly cirque basins that were formed by small alpine glaciers. Lake Creek basin is characterized by extensive wet marshy areas along the bottom of the upper basin.

Elevations range from 2,500 to 7,200 feet. About 8 percent of the soils have formed in deposits (depths vary from as little as 6 inches to more than 30 feet) of volcanic ash and pumice, and the rest have formed in granitic materials. Trails through ash soil areas are dusty, and the material is easily displaced. Once the protective vegetation has been removed, ash soils tend to be very erosive in trails and in campgrounds. The granitic materials have good bearing strength, are not very dusty, and tend to stay in place.

D. Climate

Annual precipitation ranges from 25 to 60 inches, mainly as snow.

E. Vegetation

This area is 65 percent tentatively suitable timberland.

Vegetation types vary from open pine/bitterbrush in lower Stormy Creek to Englemann spruce and Pacific silver fir in the head of Lake Creek. Large acreages of pole size lodgepole pine occupy the lower Lake Creek basin. Douglas-fir pole size timber is the predominate type in Twenty-Five Mile Creek. However, very old fire scar pockets of Douglas-fir occur throughout this area.

Pinegrass and gopher activity have caused poor regeneration in the Baldy Mountain, Forest Mountain areas, but in the wet areas like Lake Creek, overstocking of trees is the more common situation.

F. Current Uses

The current use is for dispersed recreation. The major activities and their estimated annual use are as follows:

<u>Activity</u>	<u>Estimated Annual Recreation Visitor Days</u>
Motorized Trail Riding	1,800
Hunting	3,100
Total	4,900

The area contains the following kinds and amounts of Recreation Opportunity Spectrum (ROS) Classes:

<u>ROS Class</u>	<u>Acres</u>
Semiprimitive Nonmotorized (SPNM)	11,788
Semiprimitive Motorized (SPM)	20,712
Total	32,500

There are 58.6 miles of trail within the area and are all currently open to motorized use.

G. Appearance and Surroundings

The area has moderate to high visual variety in landforms, waterforms (lakes and streams), and moderate variety in rockforms and vegetation. Parts of Lake Creek basin, Pot Peak, Stormy Mountain, and Devil's Backbone ridgetop have high visual variety. The Twenty-Five Mile and Stormy Creek drainages are evenly textured and have less visual variety.

The area is steep and has pronounced ridgetops such as the Devil's Backbone. The drainages have evenly textured vegetation. Large blocks of lodgepole pine create a smooth even appearance with limited variety. Dense vegetative patterns occur in the creek bottoms.

The area is primarily viewed as foreground and middleground from the Devil's Backbone Trail, Shady Pass Road, Pot Peak Trail area, and as background from portions of the Lake Chelan high country.

The Stormy Mountain area is surrounded by the Shady Pass Road, the upper end of the Entiat drainage, the Slide Ridge Road, and the North Fork of Twenty-Five Mile Creek.

H. Attractions

Major attractions are Stormy Mountain, Devil's Backbone, Pond Lakes and Twenty-Mile, Lake, and Stormy Creeks.

II. CAPABILITY - WILDERNESS CHARACTERISTICS

A. Manageability and Boundaries

Entiat:

The Stormy Mountain roadless area of the Wenatchee overlaps onto two Ranger Districts, the Entiat and the Chelan. The Entiat's portion included the summit of the Chelan Mountain range to the west, taking in the Lake Creek basin, Four Mile Ridge and the head of the Stormy Creek drainage, which is approximately three-fifths of the Stormy Mountain roadless area.

Chelan:

The Chelan Ranger District portion of the area straddles the crest of the Chelan Mountains occupying a portion of the east slope of the Twenty-Five Mile Creek basin. It is located between two heavily used recreational developed areas, the lower Entiat River and lower Lake Chelan. The area is almost entirely surrounded by a roaded high ridge system which can easily be viewed from the higher vantage point. The boundaries primarily follow existing roads which are easy to locate on the ground. The adjacent land in Twenty-Five Mile Creek is heavily roaded, and has had a large amount of timber cutting activity. These works of man, including seed orchards, rock quarry, and recreational developments around the mouth of Twenty-Five Mile Creek, are easily viewed from the high points of the roadless area. The City of Chelan is visible from Stormy Mountain.

B. Natural Integrity

Entiat:

The impact of past human activity in this area is relatively minor in the form of a trail system. Most of the trail system in this area has been constructed or reconstructed with State Off-Road Vehicle funds and is heavily used by motorbikes. There are approximately 20 of the total of 58.6 miles of trail located on the Entiat portion of this area. The whole area is completely encircled by roads.

Chelan

The impacts of past human activity within the Chelan Ranger District portion of the area are relatively light due to a rugged topography and marginally merchantable timber. The area is a mosaic of burned and unburned land as a result of the 1970 fires. Evidence of severe fire activity over the past 100 years is evident in the existing vegetation.

Past fire suppression efforts have left their mark on the land, including many miles of 75 foot-wide breaks constructed along the ridges to stop the ravages of the 1970 fires. The area has one old jeep road that penetrates the area about two miles along Devil's Backbone ridge south of Handy Spring. This wheel track is legally closed to four-wheeled traffic but persistent four-wheelers occasionally bypass the gate and drive the road. The area has an extensive trail system including approximately 30 miles of trails reconstructed with State IAC funds, called the Devil's Backbone ORV area. This trail system was completed in 1985, and though motorized use is presently light, it is expected to increase greatly as the area becomes better known. All of the trail system within this area has been open to motorbike use for many years. The remains of one old lookout structure is located on Stormy Mountain. There also has been some expressed interest for a winter sports area development on Stormy Mountain.

C. Natural Appearance

Entiat:

The core areas, Lake Creek basin and the head of Stormy Creek, except for the trails, are natural appearing. Some adjacent roads are visible from most areas of this unit. From Four Mile Ridge and the summit of the Chelan Mountains, evidence of timber harvest activities and roads are very evident.

The Preston Creek drainage, west of the Chelan Mountain range, has many miles of roads that were constructed during the jammer logging era of the 1960's. The whole Preston Creek drainage was burned heavily during the 1970 fires and the road system is very obvious.

Chelan:

The Stormy Mountain area is a fairly large unit, but due to its location between the highly developed lower Lake Chelan area and the lower Entiat Valley, many adjacent roads and past timber management activities are visible. From the higher points, distant roads and structures give a feeling of never being able to escape human presence. Within the unit, firebreaks on ridges and helispots are a constant reminder of man's fire suppression efforts. Area stream channels have been highly eroded due to fires and resultant watershed damage. Evidence of man's ability to stabilize stream channels, such as with introduced grasses, are present.

D. Opportunities for Solitude

Entiat:

There are some areas and cirques away from the trails that afford opportunities for solitude, but most of the area does not lend itself to solitude that one can find in larger areas.

Chelan:

The Chelan portion offers a low opportunity for solitude. Off-site visual intrusions and the evidence of human presence would be common. Since the land in the unit slopes downward toward the developed areas, topographic screening is almost non-existent except in stream bottoms.

E. Opportunities for Primitive Recreation

Entiat:

There are opportunities for primitive recreation experiences in the form of camping, hiking, and horseback riding. This area has been designated by the Washington Department of Game as a quality hunting area. There is a small lake with no trail access called Bear Lake.

Chelan:

Opportunities for primitive recreation on this portion are below average for the same reasons it is low in solitude. Opportunities do exist for backpack camping, big game hunting, horseback riding, and hiking. Also, a limited fishery exists in Twenty-Five Mile Creek. However, the recreational activities that exist would be accomplished in the presence of many off-site intrusions.

F. Challenging Experiences

Entiat:

There are no unique challenges in this area other than the normal challenges one would expect to find in a roadless area.

Chelan:

This area does possess some challenging hiking opportunities due to the extensive trail system and steep terrain. It offers some good opportunities for dispersed recreation without a real primitive experience. The area is in a quality hunting management unit and does provide good roadless mule deer hunting opportunities.

G. Special Wildlife Features

There have been sightings of peregrine falcon reported but no nesting sites have been located. The extent of use by sensitive species in this area is not known.

H. Historical and Scientific Study

There are no special or unique opportunities for outdoor education and scientific or historic study in the area which cannot already be found in the existing wilderness on the Forest.

III. RESOURCES AND POTENTIAL

A. Recreation

The area has potential value for unroaded types of recreation activities. Estimated carrying capacity by ROS Class is as follows:

ROS Class	Capacity in Potential Recreation Visitor Days Per Year
Semi-primitive Non-motorized (SPNM)	12,000
Semi-primitive Motorized (SPM)	62,000
Total	74,000

B. Wildlife

The area serves as summer range for a large mule deer herd and provides habitat for a variety of animals and birds including black bear and grouse.

C. Fish

In the Entiat portion of this roadless area, only Lake Creek has any fisheries significance. In its upper reaches there are cutthroat and possibly rainbow trout. The exact extent of the population is not known.

Stormy Creek does not have any known fish population.

Twenty-Five Mile Creek is the only stream with fish in the Chelan portion. The North Fork of Twenty-Five Mile Creek is permanently flowing in the lower one or two miles in the roadless area and has a very small population of fish. Above that point, the stream normally is intermittent. The main fork of Twenty-Five Mile Creek has small trout along much of its length.

There is a spawning channel at the lower end of Twenty-Five Mile Creek used by the Washington Department of Game for kokanee salmon from Lake Chelan. Maintenance of high quality water is important to this structure.

D. Water

The Stormy Mountain roadless area has one aerial snow marker site located on Four Mile Ridge. The site was measured and maintained from 1972 - 1981. It had a mean snow depth of 86 inches and snow water equivalent of 35 inches annually. This site is no longer active nor maintained.

Stream discharge measurements were formerly taken on Twenty-Five Mile Creek near the northerly boundary of the roadless area. This station is no longer active.

E. Livestock

A combination of steep topography and lack of natural forage vegetative types severely limits the potential of this area for domestic stock. Access and the creation of transitory range could enhance the potential along the edge of the area near Baldy Mountain and Slide Ridge.

There is some limited recreation stock use during the hunting season, particularly in the Lake Creek basin and in the Twenty-Five Mile Creek drainage.

F. Timber

The area contains 21,136 acres of tentatively suitable timberland. Stand, volume, and other data are as follows:

Ecotype	Stand Size	Acres	Estimated Standing Volume (MMBF)	(MMCF)
Wet	Mature	5,258	149.0	27.3
Wet	Immature	1,293	23.3	4.3
Wet	Seedling-Sapling	530	---	---
Dry	Mature	2,523	31.6	5.8
Dry	Immature	7,907	77.6	14.2
Dry	Seedling-Sapling	3,625	---	---
	Total	21,136	281.5	51.6

The estimated maximum biological potential contribution to the long-term sustained yield is 6.3 MMBF (1.2 MMCF) per year.

G. Mineral

This area is reported to be primarily underlain by granitic rocks of Mesozoic age. The area has not been studied in detail by the U.S.G.S. or U.S. Bureau of Mines, but it is reported to have occurrences of pumice and kyanite. Neither has been investigated adequately to determine if the deposits are of commercial value. According to Bureau of Land Management records (1/23/85), the area has had no mining claims located in it. It is not classified "prospectively valuable" for any of the leasable commodities and it has no existing leases or pending lease applications.

H. Cultural-Historical

This area encompasses a number of historic sheep allotments dating back to the turn of the century, as well as the former site of the Stormy Mountain Lookout (1919-circa 1955). There are no known or reported archaeological sites or prehistoric use areas. Based on terrain and known patterns of use, the potential for such occurrences is moderate.

I. Land Use

There are no special land uses within the area.

J. Fire

Annual fire occurrence is low to moderate and primarily started by lightning. Fuel loadings range from heavy accumulations at lower elevations to clumps of trees and scattered meadows at higher elevations. There is a frequent history of large fires in this area.

K. Insects and Disease

Past fires have created large areas of even aged lodgepole that will soon be very susceptible to mountain pine beetle damage.

Fire scarred remnant stands of Douglas-fir old-growth were heavily hit by the Douglas-fir bark beetle in the late 1970's. The North Fork of Twenty-Five Mile Sale was sold to help salvage timber killed by bark beetles.

Mistletoe infection is heavy in partially burned-over stands in Lake Creek and South Fork Twenty-Five Mile Creek. Access is needed before treatment would be cost effective.

L. Private Lands

There are 21 acres of State land in Section 16 of T27N, R20E. Access is gained from outside of the roadless area. Possibilities for acquisition are considered to be excellent.

IV. NEED

A. Nearby Wilderness and Other Roadless Areas

This area is located between the Chelan, Entiat, and the Slide Ridge roadless areas.

B. Distance from Population Centers

The area is within two to four hours driving time from population centers such as Seattle, Tacoma, Yakima, Tri-Cities, and Wenatchee.

C. Need for Ecosystem Representation

There is a unique riparian zone in the area of the Pawn Lakes Meadows within the Entiat Ranger District portion. These meadows are ancient lakes that have silted in but are still marshy. There are plant communities and fauna that are unique to this type of setting.

D. Interest by Proponents, Including Congressional

Since the passage of the 1984 Washington State Wilderness Act of 1984, there has been no strong interest for additional wilderness classification for this area by environmental proponents.

E. Public Input

Public input during the RARE I and other planning efforts was obtained and supported unroaded allocations.

F. Other Public Involvement

Public input solicited during the formulation of alternatives for this plan indicated much support for dispersed, unroaded recreation use for the area. Opinions differ as to whether the area should be for motorized or nonmotorized use.

V. ENVIRONMENTAL CONSEQUENCES

A. Environmental Consequences Associated with the Alternatives

1. Recreation

a. Significant Effects

The area around Stormy Mountain has limited potential as a winter sports site. Local proponents have attempted to develop an interest in the area since 1969. Difficult access and the lack of an adequate base area have been the biggest factors for lack of development.

Alternatives A/NFMA and H would not allocate any of the area to unroaded management. Under these alternatives most of the area would be entered for timber harvest and all the inventoried semi-primitive, motorized and non-motorized recreation opportunities would be lost within the planning period.

Sixty percent of the area will be converted to ROS Class Rooded Natural through timber harvesting under the Scenic Travel prescription and to enhance wildlife. The remaining 40 percent of the area would present a Rooded Modified ROS setting to the recreation user, after the timber harvesting was completed.

If this area is rooded and harvested, some portions of the existing trails may be affected. It would lose its unrooded characteristics, and the quality hunting that this area has been designated for by the Washington State Game Department would diminish. Road construction could possibly enhance access for development of the Stormy Mountain Ski Area.

Alternatives B, D and J result in over 60 percent of the area to be emphasized for timber management. The ROS setting for this area will change from Semi-primitive to Rooded Modified as timber production is maximized. The roadless character of the area will be irretrievably lost, semi-primitive recreation would decrease significantly.

Large segments of the area, the Lake Creek basin and the upper half of the Stormy Creek drainage, would be allocated as General Forest, available for rooding and timber harvest. The area along the summit of the Chelan Mountains, where the Devil's Backbone Trail is located, would be allocated Dispersed Recreation, Unrooded Motorized. Over 80 percent of this unrooded area would be designated General Forest.

If timber is harvested under the General Forest allocation, the area, with the exception of a special interest area designation around the Pawn Lakes Meadows, will lose its unrooded characteristics and the quality hunting would diminish.

Alternatives C and I would allocate about 29 percent of the area to semi-primitive, motorized use with the rest of the area allocated to timber harvesting. About 35 percent of the area will have a rooded modified setting due to maximizing timber harvest. The remaining area would have timber harvesting in the background and to enhance the wildlife potential.

Under Alternatives C and I, the portion of the trail system in this roadless area is allocated as follows:

Trail Name	Trail Number	Unrooded Non-Motorized	Unrooded Motorized	Rooded Motorized
Windy Saddle	1232	--	1.0	0.5
Loan Peak	1264	--	--	2.0
NF 25 Mile Creek	1265	--	2.0	7.0
Pot Peak	1266	--	1.0	9.0
Devils Backbone	1448	--	13.0	--
Lake Creek	1443	--	2.0	5.6
Angle Peak	1444	--	1.0	3.0
4 Mile Ridge	1445	--	5.3	1.0
Stormy Creek	1451	--	1.0	4.2
Totals			26.3	32.3

These alternatives would allocate the Lake Creek basin as scenic travel, partial retention with special interest area designation around Pawn Lakes Meadow. The area along the ridge of the Chelan Mountains would be classified as Dispersed Recreation, Unrooded Motorized. The upper portion of Stormy Creek and a small area between Fox Creek and Lake Creek known as Little Fox would be General Forest. The significant effects would be similar to Alternatives A/NFMA and H.

Although roading would not be as severe as Alternatives B and D, the semi-primitive, non-motorized use of the area would be totally eliminated. The loss of the dispersed recreation, non-motorized use will be a concern for the roadless recreation users as approximately half the area that is presently inventoried for that use will be lost. Some loss of trails can be expected from roading and the semi-primitive hunting opportunity will decrease. Access to Stormy Mountain may be enhanced through timber sales and road development.

Alternatives E and F allocate almost the entire area to unroaded management objectives. The existing inventoried area of two-third semi-primitive, motorized and one-third semi-primitive, non-motorized would remain essentially the same under these alternatives. Use could increase significantly in the Dispersed Recreation, Motorized category due to the publicity of the Devil's Backbone ORV area.

Alternative F would allocate the Lake Creek Basin, with the exception of the Pond Lakes special interest area, to Dispersed Recreation, Unroaded, Non-motorized, and the remainder of the area would be Dispersed Recreation, Unroaded, Motorized with trails open to motorbikes. In the non-motorized area it would mean the reduction of 19 miles of trail available for motorized use, which have been reconstructed with State off-road vehicle funds.

Alternative G would convert the existing one-third use in the Roadless Non-motorized category to Motorized. The majority of the area would be managed roadless and would promote motorized use. Additional ORV trails could be constructed to expand the motorized use. Very little timber harvesting would be accomplished and the non-motorized setting would be eliminated.

b. Summary

The following tables indicate, by alternative, the degree to which this area will be allocated to roadless management and, of the roadless management acres, what percent is motorized and non-motorized. These represent the Semi-primitive, Motorized and Semi-primitive, Non-motorized Recreation Opportunity Spectrum (ROS) Classes. The area being allocated to roaded types of management activities will become Roaded Natural or Roaded Modified ROS opportunities depending on the intensity of development.

Percent of the Area Having Unroaded Allocation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	0	17	30	17	95 1/2	87	89	0	30	17

Percent of the Unroaded Allocation Area
In Terms of Motorized/Non-Motorized Recreation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	0/0	100/0	100/0	100/0	69/31	72/28	100/0	0/0	100/0	100/0

1/This reflects the existence of the Entiat Experimental Forest which is dedicated to research of the various resource management activities.

The area being allocated to roaded management activities will have increased dispersed roaded recreation opportunities and the possible opening of access to potential developed recreation sites. The trail miles within the area allocated to roading may provide a less semi-primitive recreation experience with a more roaded natural or roaded modified setting.

2. Wild, Scenic, and Recreational Rivers

A portion of the following river corridors (one-quarter mile either side of the river) is located within this roadless area and is recommended for designation in Alternatives C and I:

<u>River</u>	<u>Recommended Classification</u>
Entiat River	Segment 3 Recreational

More information concerning this recommendation can be found in Chapter III and Chapter IV.

3. Cultural Resources

Consideration of cultural resource values are required by a special set of historic preservation laws, regulations and policies. Particular efforts will be made in every alternative to inventory, evaluate, and provide for significant cultural resources in areas where Forest management activities are planned.

4. Scenery

Alternatives A/NFMA and H will allocate about a third of the area to Maximum Modification VQO. These areas are the Devil's Backbone trail and its adjacent areas, and the upper end of Twenty-Five Mile Creek basin. The upper hillside of the Twenty-Five Mile Creek basin areas as viewed from the Lake Chelan viewshed will be heavily altered. Trails in the area will be altered. Much of the area will be allocated to a Partial Retention middleground view from Lake Chelan.

Alternatives B, D and J will allocate most areas to Maximum Modification VQO. These areas are the Twenty-Five Mile basin, Pot Peak Trail Area, Lake Creek basin except the immediate Lake Creek Meadows, and the Shady Pass area. The Twenty-Five Mile Basin is highly visible from Lake Chelan and its surrounding community. Some areas will have higher visual quality. These areas are the Devil's Backbone Trail and the ridge tops of Stormy Mountain, Devil's Backbone, and Angle Peak to Crescent Hill.

Alternatives C and I will allocate many areas to Retention and Partial Retention VQO. Some areas will be allocated to Maximum Modification. The Upper Twenty-Five Mile Creek basin will be heavily altered as viewed from the Lake Chelan community. Other altered areas are parts of the Lake Creek and Shady Pass viewshed.

Alternative E will allocate all areas to Retention VQO except the Experimental Forest allocation. Most of the area will be natural appearing. The view from Lake Chelan will be preserved.

Alternative F allocates most areas to Retention VQO. The view from Lake Chelan will be natural appearing.

Alternative G will allocate most of the area to Retention or Dispersed Recreation, Unroaded, Motorized. The view from Lake Chelan will be natural appearing.

The following table summarizes the Scenic component of this area by alternative in acres of Visual Quality Objective (VQO).

VQO	A/NFMA	B	C	Alternative		F	G	H	I	J
				D	E					
Preservation	-	-	-	-	-	-	-	-	-	-
Retention	605	7,505	11,682	7,505	30,868	29,830	30,063	605	11,682	7,271
Partial Retention	14,967	1,972	7,802	1,972	-	826	954	14,967	7,802	2,015
Modification	3,763	1,653	1,653	1,653	1,632	1,632	1,653	3,763	1,653	1,653
Maximum Modification	13,165	21,370	11,363	21,370	-	212	170	13,165	11,363	21,561
Total Acres	32,500	32,500	32,500	32,500	32,500	32,500	32,500	32,500	32,500	32,500

Preservation indicates that only natural, ecological changes will occur.

Retention indicates an essentially natural appearing landscape will be present.

Partial Retention indicates the landscape will be slightly altered.

Modification indicates a moderately altered landscape will be present.

Maximum Modification indicates a heavily altered landscape may be present.

5. Wildlife

Alternatives A/NFMA and H would road all of the area and allow for timber harvest emphasis on 41 percent of the area, which would be approximately one-half of the impact on wildlife of Alternatives B, D and J. Alternatives B, D and J would road 83 percent and emphasize harvest on 66 percent of the area. Alternatives C and I would road 70 percent of the area and have harvest emphasis on 35 percent; this would be less impact than B, D and J but more than A/NFMA and H. Alternative E would have an insignificant impact on wildlife habitat while F and G would have slightly more impact than E.

6. Fisheries

a. Significant Effects

In Alternatives E, F, and G, the areas surrounding Lake and Twenty-Five Mile Creeks, the only significant systems with fish in this roadless area, would remain unroaded. In Alternatives B, D and J both areas would be available for intensive timber management. In Alternatives A/NFMA, C, H, and I, the Twenty-Five Mile Creek area could also be managed for intensive timber harvest, while the Lake Creek area could be managed using primarily extended shelterwood timber harvest methods. In all alternatives except A/NFMA and H, a small portion of Lake Creek would be designated a "special interest" botanical area.

Roading the Lake and Twenty-Five Mile Creek areas could change the recreational fishing opportunities. Since about two-thirds of the Forest's fishing occurs in roaded areas, it is expected that fishing would increase. This would help to meet a portion of the fishing demand (see Chapter III on Fish), but also could result in overfishing with a reduction in both numbers and size of fish using the habitat. Twenty-Five Mile Creek, with a very low population of fish in the roadless area, probably would be unaffected by roading. Lake Creek, in its lower gradient reaches in the upper watershed, could be heavily fished, depending on developed access.

It is also possible that roading the unroaded areas could result in environmental degradation to streams due to timber harvest and road construction in the basins (see Chapter IV Environmental Consequences). Some of these possible effects are addressed in the Soil and Water Environmental Effects section. Overall, even if both areas would be roaded, it is not expected that there would be any significant effects on the resident fish populations.

b. Mitigation Measures

In the alternatives that could road presently unroaded areas, the riparian protection zone prescription, the Wenatchee National Forest's Best Management Practices, and all standards and guidelines common throughout riparian areas of the Forest would be applied in stream zones. This treatment should adequately protect the streams from a reduction in fish habitat capability.

If the areas are roaded, road closures could be implemented to reduce the impact of enhanced access on the native fish populations.

7a. Vegetation: Trees

Management direction under Alternatives A/NFMA and H does not preclude roading or vegetative manipulations through timber sales on any of this area. Timber emphasis is allocated on 13,165 acres or 41 percent of the area under these alternatives. An additional 17,501 acres are zoned special resource management area where timber sales will be used to manipulate the existing vegetation.

All other alternatives allocate at least the ridge top portion of this area to unroaded recreation. Alternative E allocates the entire roadless area except the Entiat Experimental Forest, to unroaded non-motorized recreation. Alternative F is similar with 87 percent, or 28,175 acres, allocated to roadless recreation with no timber harvest scheduled.

In Alternatives C and I, the unroaded motorized recreation zone would be 9,498 acres or, 29 percent of the area. The remaining area would permit manipulation through timber sales.

Alternatives B, D and J would have timber sales proposed for 23,618 acres, similar to Alternatives C and I. However, most of the acres under B, D and J would be timber emphasis acres. Under Alternative G, the largest block (1,103 acres) of vegetative manipulation acres would emphasize the scenic travel prescriptions. However, 28,726 acres or 88 percent, would not schedule any timber management, but would be allocated to unroaded motorized recreation.

7b. Vegetation: Forage

Alternatives C, H and I, with the proposed vegetative manipulation and improved access, will contribute adequate forage to the base needed for big game and livestock. Alternatives A/NFMA, B, D and J will provide forage in excess of projected needs. Alternatives E, F, and G which have little or no vegetative manipulation proposed, will not provide adequate forage to meet the projected needs for livestock, particularly in the fourth and fifth decade. Prescribed fire in the remaining unroaded portion of this area could offset the loss of forage for big game due to ecological succession.

8. Soil and Water

a. Significant Effects

The environmental consequences of allocating the Stormy area to General Forest or Roadless Management are discussed by alternative below. Alternative E could allocate up to five percent of the area to timber harvest or road building which would be relatively insignificant. Alternatives F and G could allocate up to five percent, and Alternatives B, C, D, I and J could allocate up to 73 percent of the area to timber harvest and road building. Alternatives A/NFMA and H would allocate the entire area to timber harvest and road building. The environmental effects of timber harvest and road building on soil and water are discussed in Chapter IV - Soil and Water sections.

The risk of degrading the soil and water resource increases with more timber harvest and road building. Alternatives A/NFMA and H pose more risk of degrading the soil and water resource than Alternatives B, C, D, I and J and Alternatives F, G, and E, respectively. However, since Wenatchee National Forest Best Management Practices and Forest Plan Standards and Guidelines will be employed, no unique soil and water effects are expected to occur because of forest management in this area.

b. Mitigation Measures

The mitigation measures that will be used in this area are the same as those discussed in Chapter IV - Soil and Water sections.

9. Air

The additional prescribed burning generated in the Stormy roadless area as a result of the alternatives would not have a significant effect on air quality beyond the impacts discussed in Chapter IV.

10. Minerals

Since this area appears to have a low potential for the occurrence of mineral resources, the consequences on mineral resources do not appear to be extremely significant nor do they appear to vary appreciably by alternative. However, the management prescriptions under which the area would be managed in each alternative would restrict mineral activities to varying degrees (i.e., special stipulations in leases and in approved operating plans). The effects of these restrictions cannot be quantified, but the negative influence they would have on interest in conducting exploration activities within the area does vary by alternative and will, therefore, affect the potential for discovering and/or developing any unknown mineral resources of the area. This relative variation between alternatives is depicted on the following table.

Consequences on Mineral Resources

Restrictive Nature of Management Prescriptions	Acres Restricted by Management Prescriptions Alternative									
	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
Withdrawn from Mineral Entry (valid existing rights will be determined and recognized)	0	0	0	0	0	0	0	0	0	0
Highly Restrictive	2,449	9,477	13,654	9,477	32,500	31,344	31,046	2,449	13,654	9,433
Moderately Restrictive	14,755	1,633	7,462	1,633	0	954	1,284	14,755	7,462	1,485
Relatively Few Restrictions	15,296	21,390	11,384	21,390	0	212	170	15,296	11,384	21,582

11. Roads

The miles of local roads shown below for each alternative are those that are expected to be constructed to permit timber harvest. They are included in the totals for the various alternatives shown in Chapter IV of the FEIS. It is assumed that the bulk of these roads will be constructed within the next 20 years. An analysis of the road development in unroaded areas during the past ten years indicates that for every acre harvested approximately 5.5 acres are accessed. It is assumed that 50 percent of these roads will be closed to public traffic, and that the remainder will be suitable for travel by high clearance vehicles only.

These mileages are estimates based upon typical road densities necessary to harvest timber on different slope classes. The actual road miles that will result from the implementation of the various alternatives will be determined during project planning, design, and environmental analysis. The assumptions made for this analysis will be monitored. The construction of any road will be subject to the appropriate environmental analysis. That analysis will address the effects on resources that are dependent upon a roadless setting, including any adjacent roadless area or wilderness. The decision to close any road will be made on a case-by-case basis, according to the Forest Road Closure Policy found in the Forest-wide Standards and Guidelines.

Alternative

	A/NFMA	B	C	D	E	F	G	H	I	J
		PREFERRED								
Miles	88	72	72	72	0	4	5	88	72	72

12. Fire

The fire management workload generated in the Stormy roadless area, as a result of the alternatives, will not have a significant effect beyond the effects already described in Chapter IV.

A slight increase in risk of recreation related fires would occur in Alternatives E, F, and G. Additional road access due to increased timber harvest activity would also increase risk of fire in Alternatives A/NFMA, B, D, H and J.

The cost efficiency of fire suppression activities would be slightly increased in Alternatives A/NFMA, B, D, H and J as road access would allow more area to be covered by ground based suppression resources. Cost efficiency levels in Alternatives E, F, and G would be less due to slower initial attack by ground forces or the use of more expensive aerial delivered resources such as helitack or smokejumpers.

The impacts generated by slash disposal activities are discussed in Chapter IV.

13. Social/Economic

To measure this area in terms of its social value, a basic assumption is being made. This is, that because of the expressed interest in keeping as much of the inventoried roadless areas as possible in an unroaded condition, the more that condition is reflected, the higher the social value.

This condition is reflected for each alternative in the summary chart under item 1, Recreation, at the beginning of this section (Section V), which indicates the acres of unroaded management.

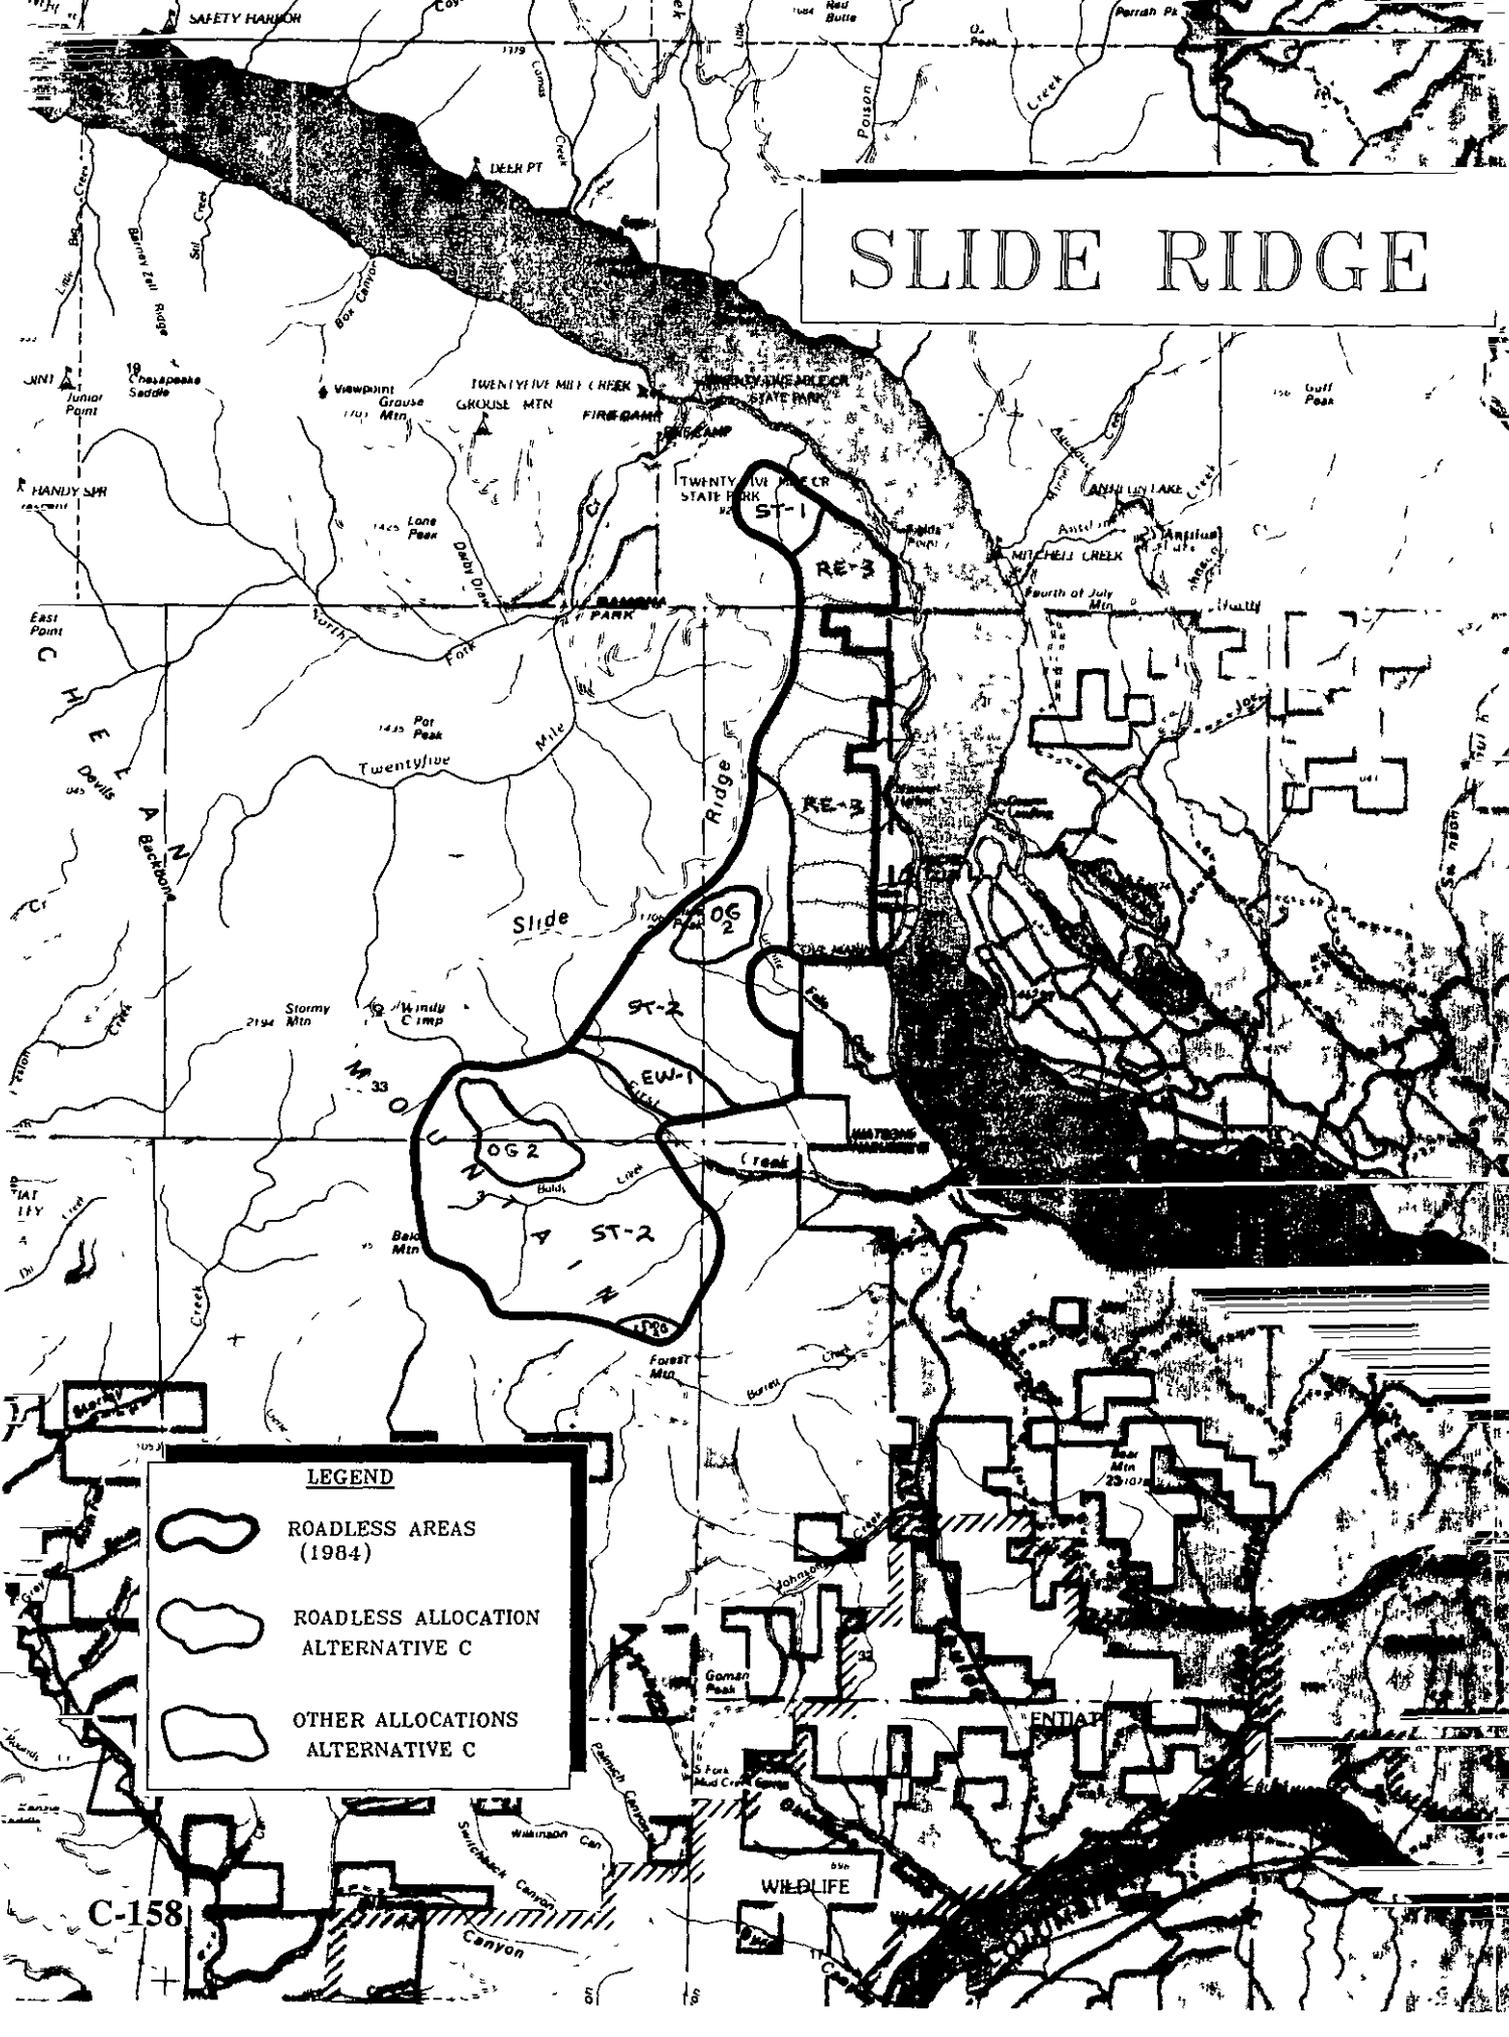

Also, as there is varying opinion as to the mode of transportation allowed, individuals must judge for themselves which alternative best meets that aspect of the social setting. There is also a summary table reflecting this condition for each alternative as referenced above which indicates the amount of motorized versus non-motorized use within the unroaded allocation.

A general measure of timber oriented economic impacts can be made using the same table referenced above showing the amount of unroaded allocation. The larger the unroaded area, the greater the impact on timber-oriented jobs. If all of the estimated long-term sustained yield per year for this area were available, it would support 80.6 jobs.

14. Wilderness Potential

This roadless area has limited potential for wilderness as an individual wilderness, or as part of an addition to existing wilderness. All alternatives, with the exception of E, F, and G, result in large portions of the area allocated to roaded prescriptions. Alternatives A/NFMA and H would retain no acres in unroaded condition. Alternatives B, C, D, H, I, and J would retain only 16 percent of the area in unroaded condition. Alternatives B, D, and J would allocate the largest acreage, 21,370 acres to General Forest with road construction, timber harvest, and high levels of modification of natural conditions. Alternatives E, F, and G retain the most wilderness character.

SLIDE RIDGE

LEGEND

-  ROADLESS AREAS (1984)
-  ROADLESS ALLOCATION ALTERNATIVE C
-  OTHER ALLOCATIONS ALTERNATIVE C

C-158

SLIDE RIDGE ROADLESS AREA

Size: Gross Acres: 10,409

Net Acres: 10,091

I. GENERAL INFORMATION

A. History

This area was studied under RARE I but not selected. The 1974 Chelan Unit Plan directed the area to sustained resource production. It was re-inventoried in the fall of 1983. None of the area was included as wilderness under the Washington State Wilderness Act of 1984 proceedings.

B. Location and Access

It is located near the southern end of Lake Chelan and extends inland on the south side of the lake. It is just east of the Stormy Mountain roadless area. Access is via the Stormy Mountain Road and there are no maintained trails within the area.

C. Physiography and Soils

Part of this area is very steep and barren and is highly visible from both Manson and the city of Chelan. The slide itself has been responsible for closure of the south shore road on numerous occasions and for damage to private property. Much of the area is overstocked with dense stands of lodgepole pine that has grown up since the 1970 fires.

Elevations range from 1,650 to 5,700 feet. Approximately 68 percent of the soils have developed in deposits of volcanic ash and pumice (depths vary from as little as 6 inches to more than 30 feet) and the rest have formed in granitic materials. Ash soils tend to be very dusty when dry. They are also easily displaced and are very erosive if the protective surface vegetation is removed. Soils formed in granitic materials have good bearing strength and tend to stay in place.

D. Climate

Precipitation ranges from 25 to 45 inches annually and falls mostly as snow.

E. Vegetation

This area is 60 percent tentatively suitable forest land, most of which (90 percent) is dry forest ecotype. Only 12 percent of the suitable land is mature timber.

Most of this area is dense overstocked Douglas-fir, ponderosa pine type. Small diameter lodgepole pine and subalpine fir stands occur at higher elevations. Pinegrass, bitterbrush, ceanothus, and poison oak are common understory plants in this predominantly dry ecotype.

F. Current Uses

The current use is for dispersed recreation. The major activity and its estimated annual use is:

Activity	Estimated Annual Recreation Visitor Days
Hunting	1,000

The area contains the following Recreation Opportunity Spectrum (ROS) class:

ROS Class	Acres
Semiprimitive Nonmotorized	10,091

There are no trails within the area.

G. Appearance and Surroundings

The area has a moderate visual variety in landforms, vegetation, and rockforms, and a low variety in waterforms (lakes and streams).

The area has a steep, broken vegetative pattern with dense vegetation along streams. Some rockforms occur along the ridgetops and as the contrasting slides of Slide Ridge. The Baldy and First Creek basins have a variety of vegetative patterns of dense to sparse vegetation.

The area is primarily viewed as middleground from the Lake Chelan area, and Baldy and Forest Mountains.

The Slide Ridge area is surrounded by Lake Chelan, Slide Ridge, Baldy and Forest Mountains, and First Creek.

H. Attractions

There are no major attractions within the area.

II. CAPABILITY-WILDERNESS CHARACTERISTICS

A. Manageability and Boundaries

The Slide Ridge roadless area occupies the rugged east slope of Slide Ridge and the upper portion of the First Creek drainage. Due to the steep terrain and difficult access, the area acts as a physical barrier to existing or potential public use. However, the area lies immediately adjacent to the highly developed west shore of lower Lake Chelan and is heavily influenced by the sights and sounds of private land in the lower Lake Chelan basin. These sights and sounds include developed recreation, orchards, residential areas, roads and power boats.

B. Natural Integrity

The rough topography of the area has almost excluded any past human activities, the exceptions being a 1.5 mile-long power line that crosses the area and two special use waterlines extending a short distance into the east side. A system of existing roads nearly encircles the boundary of the area. The one human influence that has had an impact on the natural conditions is fire. Portions of the area were burned by 1970 and 1979 fires and some firelines were constructed.

C. Natural Appearance

The area gives a feeling of being free from disturbance; however, the location adjacent to and above the highly visible, lower Lake Chelan basin gives the feeling of being "downtown." The proximity and sight of lower Lake Chelan gives the viewer an overwhelming feeling of human presence.

D. Opportunities for Solitude

The proximity to the occupancy zone along lower Lake Chelan offers little opportunity for solitude. The sight and sounds of man and the highly altered environment are ever present.

E. Opportunities for Primitive Recreation

The area offers no real primitive recreation opportunities. Although access to the area is not difficult, the steep terrain limits recreation use primarily to big game hunting.

F. Challenging Experiences

This area offers a real challenge to those intrepid souls that wish to hike from the bottom to the top of the area; however, the challenge is a physical endeavor and has little to do with wilderness adventure.

G. Special Wildlife Features

During the winter and spring months, bald eagles make use of the lower elevations near Lake Chelan foraging for food. No other threatened or endangered species have been found in this area. The extent of use of this area by sensitive species is unknown.

H. Historical and Scientific Study

The area possess a geologic phenomenon (earthquake fault) called "The Slide" which is a natural, raw, steep slope of inherent instability. Its presence on Slide Ridge is a local landmark.

III. RESOURCES AND POTENTIALS

A. Recreation

The area has potential value for unroaded types of recreation activities. Estimated carrying capacity by ROS class is as follows:

ROS Class	Capacity in Potential Recreation Visitor Days Per Year
SPNM	10,000

B. Wildlife

The lower elevations of this area provide winter range for a large mule deer herd. A few deer, as well as black bear, spend the summers in this area.

C. Fish

There is nothing significant about fish in this area.

D. Water

There are no water related encumbrances or planned projects within the area.

E. Livestock

There is no current potential for stock use within this area. Very steep topography limits the potential of grazing, except near Forest Mountain and possibly in a few locations near the top of Slide Ridge.

F. Timber

The area contains 6,105 acres of tentatively suitable forest land. Stand, volume, and other data are as follows:

Ecotype	Stand Size	Acres	Estimated Standing Volume (MMBF)	(MMCF)
Wet	Mature	21	.6	.1
Wet	Immature	593	10.7	2.0
Dry	Mature	742	9.3	1.7
Dry	Immature	3,943	38.7	7.1
Dry	Seedling-Sapling	806	---	---
	Total	6,105	59.3	10.9

The estimated maximum biological potential contribution to the long-term sustained yield is 1.8 MM Bd. Ft. (0.3 MM Cu. Ft.) per year.

G. Minerals

The subject land is primarily underlain by granitic rock of Mesozoic ages; however, the northern portion is also underlain by pre-upper Jurassic metamorphic rocks. The area has not been studied in detail by the U.S.G.S. or U.S. Bureau of Mines, but there are reported occurrences of fluorite and pumice. Neither commodity has been objectively investigated to determine if the deposits have commercial value. According to Bureau of Land Management records (1/23/85), there are no mining claims located within the area. The area is not classified prospectively valuable for any of the leasable commodities, and there are no existing leases or pending lease applications.

H. Cultural-Historical

No cultural sites are known or recorded in this unit. The area is marginal to most historic uses of Lake Chelan, and there are few resources or topographic features present that would attract prehistoric use at a level sufficient to leave identifiable remains.

I. Land Use

There is a special use electric transmission line across portions of Sections 7 and 8 T28N., R21E., W.M.

J. Fire

Annual fire occurrence is high and primarily started by lightning. Fuel loadings range from heavy accumulations of down fuels at lower elevations to scattered alpine timber and meadows at higher elevations. There is a frequent history of large fires in this area.

K. Insects and Disease

Mistletoe on both Douglas-fir and lodgepole pine is very damaging in this area. This, in conjunction with overstocking, often makes stand destruction a more viable option than thinning in immature stands.

L. Private Lands

There are 318 acres of private lands within the area along the northeast portion. Access is gained by means outside of the area. Possibility for acquisition is considered to be fair.

Current access is by other than roads.

IV. NEED

A. Nearby Wilderness and Other Roadless Areas

This area is located within 25 miles of both the 145,667 acre Lake Chelan-Sawtooth and the 576,865 acre Glacier Peak Wilderness Areas and just east of the Stormy Mountain roadless area.

B. Distance From Population Centers

The area is reachable within two to four hours driving time from population centers such as Seattle, Tacoma, Yakima, Tri-Cities, and Wenatchee.

C. Need for Ecosystem Representation

There are no special or unique ecosystems within the area in need of representation through wilderness classification.

D. Interest by Proponents, Including Congressional

Since the passage of the Washington State Wilderness Act of 1984, there has been no apparent interest for additional wilderness classification by proponents or Congressional factions.

However, there have been proposals by both environmental and off-road vehicle users to maintain roadless status for the area.

Local citizens have expressed an interest in potential development on Slide Ridge adjacent to "The Slide" area. The concern has been that any road building or vegetative manipulation above or adjacent to "The Slide" may intensify the natural erosion process with resultant downstream damage.

E. Public Input

Public input during the RARE I and other planning efforts was obtained and it supported unroaded allocations.

F. Other Public Involvement

Public input solicited during the formulation of alternatives for this plan indicated support for dispersed unroaded recreation use for the area. Opinion differs as to the area being for motorized or nonmotorized use.

V. ENVIRONMENTAL CONSEQUENCES

A. Environmental Consequences Associated with the Alternatives

1. Recreation

a. Significant Effects

The Slide Ridge roadless area consists of 10,091 acres located on the rugged east slope of Slide Ridge and a large portion of the First Creek drainage.

The area does not contain any trails and has been inventoried according to the ROS as primarily Semi-primitive, Non-motorized.

However, because of the steep terrain, poor access and lack of attractive destination points, the area's current use is almost entirely by deer hunters during the months of October and November. The total use of the area is light, estimated at approximately 1000 RVDs.

Alternatives A/NFMA and H would not allocate any of the area to unroaded management. The entire area would be managed for timber harvest. Approximately 79 to 83 percent of the area would be managed under the Scenic Travel-Retention or Partial Retention prescription, which maintains a natural appearing environment in the foreground and middleground. Thirteen percent of the area is managed under the timber management prescriptions.

The inventoried semi-primitive, non-motorized recreation opportunities would be converted to ROS classes Roaded Natural and Roaded Modified during the planning period.

Total recreation use for the area would probably increase due to increasing roaded access. The activities of hunting and scenic driving would account for the majority of the use. Any new roads, as viewed by the recreation users on Lake Chelan and in the Manson area, would probably be looked upon negatively.

Alternatives B, D and J would allocate 62 percent of the area for maximum timber harvest and heavy roading, with approximately 11 percent of the area remaining as unroaded. These alternatives would maximize vegetative management and change the ROS setting to Roaded Modified.

Recreation use in the form of visitor travel and sightseeing would increase but the developed areas as viewed from Lake Chelan will detract from the natural setting. Timber production will be maximized at the expense of the natural landscape, which is the scenic backdrop to the heavily used lower Lake Chelan area.

Alternatives C and I allocate 25 percent of the area to roadless management. Recreation use in the semi-primitive, non-motorized setting would remain at present levels. The remainder of the area would be managed primarily in the Scenic Travel-Partial Retention ROS class. Some road building would occur but foreground and middleground views of the established vegetation would be preserved. The majority of the use would occur within the Roaded Natural ROS setting. There are no system trails in this roadless area.

Alternatives E and F maximize the area to be managed with no roading or timber harvesting activities. Almost the entire area would be managed to enhance Dispersed Recreation, Non-motorized, and Motorized ROS classes. The greatest change in the recreation use will be the increase in motorized dispersed recreation activities which could occur through additional trail development within the area. The increase in motorized trail use at the expense of the non-motorized use could be an issue with the roadless, non-motorized proponents.

Alternative G will be managed as Scenic Travel Retention which changes the ROS setting from Semi-primitive, Non-motorized to Roaded Natural. Timber cutting will occur within the background areas.

b. Summary

The following tables indicate, by alternative, the degree to which this area will be allocated to roadless management and, of the roadless management acres, what percent is motorized and non-motorized. These represent the Semiprimitive Motorized and Semiprimitive Non-Motorized Recreation Opportunity Spectrum (ROS) Classes. The area being allocated to roaded types of management activities will become Roaded Natural or Roaded Modified ROS opportunities depending on the intensity of development.

Percent of the Area Having Unroaded Allocation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	0	10	25	10	100	92	0	0	25	10

Percent of the Unroaded Allocation Area
In Terms of Motorized/Non-Motorized Recreation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	0/0	0/100	0/100	0/100	66/34	72/28	0/0	0/0	0/100	0/100

The area being allocated to roaded management activities will have increased dispersed roaded recreation opportunities and the possible opening of access to potential developed recreation sites. The trail miles within the area allocated to roading may be reduced as road construction occurs. The roadless character of these portions would also be lost.

2. Wild, Scenic, and Recreational Rivers

There are none associated with this roadless area.

3. Cultural Resources

Consideration of cultural resource values are required by a special set of historic preservation laws, regulations and policies. Particular efforts will be made in every alternative to inventory, evaluate, and provide for significant cultural resources in areas where Forest management activities are planned.

4. Scenery

Alternatives A/NFMA and H will allocate much of the area to Retention and Partial Retention VQO. The foreground and middleground views from Lake Chelan will have high visual quality. The Maximum Modification allocation remains on the backside of the Lake Chelan viewshed and is not visible from that travel route.

Alternatives B, D and J allocate much of the area to Maximum Modification VQO. The middleground view from the Lake Chelan area will be heavily altered from the Baldy Creek basin and Slide Peak area. The foreground view of Lake Chelan is allocated to Retention VQO.

Alternatives C and I will allocate the foreground view from Lake Chelan to Retention and most middle-ground views to Scenic Travel Partial Retention.

Alternative E will allocate all foreground and middleground view of Lake Chelan to Retention. All areas will have natural appearing landscapes. The view from the Lake Chelan viewshed will be preserved.

Alternative F will allocate most landscape to Retention VQO. Some land will be allocated to Partial Retention and Maximum Modification VQO. All views from Lake Chelan will be natural appearing.

Alternative G allocates most land to Retention Scenic Travel VQO. Views from the Lake Chelan viewshed will be protected by Retention and Partial Retention VQO.

The following table summarizes the Scenic component of this area by alternative in acres of Visual Quality Objective (VQO).

VQO	A/NFMA	B	Alternative							
			C PREFERRED	D	E	F	G	H	I	J
Preservation	--	--	--	--	--	--	--	--	--	--
Retention	2,862	3,010	2,989	3,010	10,091	9,646	8,735	2,862	2,989	1,272
Partial Retention	5,893	954	6,656	954	--	403	1,314	5,893	6,656	2,692
Modification	--	403	382	403	--	--	--	--	382	382
Maximum Modification	1,336	5,724	64	5,724	--	42	42	1,336	64	5,745
Total Acres	10,091	10,091	10,091	10,091	10,091	10,091	10,091	10,091	10,091	10,091

Preservation indicates that only natural, ecological changes will occur.

Retention indicates an essentially natural appearing landscape will be present.

Partial Retention indicates the landscape will be slightly altered.

Modification indicates a moderately altered landscape will be present.

Maximum Modification indicates a heavily altered landscape may be present.

5. Wildlife

Alternatives A/NFMA and H would road all of the area and allow for timber harvest emphasis on about 13 percent of the area. Alternatives A and H would have one-fifth the impact of Alternatives B, D and J which would road 89 percent of the area and allow for timber harvest emphasis on 62 percent of the area. Alternatives C, F, G, and I would have a minimal effect on wildlife while Alternative E would have no impact on wildlife habitat.

6. Fisheries

There are no significant consequences relating to fish in this roadless area.

7a. Vegetation: Trees

Current management direction under Alternatives A/NFMA and H does not preclude roading or vegetative manipulations through timber sales on any of this area. Timber emphasis is allocated on 1,463 acres or 14 percent of the area under this alternative. An additional 8,628 acres are zoned special resource management area where timber sales will be used to manipulate the existing vegetation.

All other alternatives except G allocate at least a portion of this area to nonroaded recreation. Alternative E allocates the entire roadless area to unroaded recreation where no timber sales are scheduled. Alternative F is similar with 92 percent, or 9,243 acres, allocated to roadless recreation with no scheduled timber harvest.

Under Alternatives C and I the unroaded non-motorized recreation zone would be 2,502 acres or 25 percent of the area. The remaining 75 percent of the area would permit manipulation through timber sales. However, only 5,131 acres, or 51 percent of the area, is suitable for timber harvest under these alternatives. Alternatives B, D and J would have timber sales proposed for 8,077 acres, similar to Alternatives C and I. However most of the acres under B, D and J would be timber emphasis acres. Under Alternative G, the largest block of vegetative manipulation acres (8,883, or 88 percent) would emphasize the scenic travel prescriptions.

7b. Vegetation: Forage

Alternatives C, H, and I, with the proposed vegetative manipulation and improved access, will contribute adequate forage to the base needed for big game and livestock. Alternatives A/NFMA, B, D and J will provide forage in excess of projected needs. Alternatives E, F, and G, which have little or no vegetative manipulation proposed, will not provide adequate forage to meet the projected needs for livestock, particularly in the fourth and fifth decade. Prescribed fire in the remaining unroaded portion of this area could offset the loss of forage for big game due to ecological succession.

8. Soil and Water

a. Significant Effects

The environmental consequences of allocating the Slide Ridge area to General Forest or roadless management are discussed by alternative below. No significant soil and water consequences are associated with Alternative E because soil and water disturbing activities would be minimal. Up to eight percent of the area could be allocated to timber harvest and road building in Alternative F. Alternatives B, C, D, I and J could allocate up to 89 percent, and Alternatives A/NFMA, G, and H could allocate up to 100 percent of the area to timber harvest and road building. The environmental effects of timber harvest and road building on soil and water are discussed in Chapter IV - Soil and Water sections.

The risk of degrading the soil and water resource increases with more timber harvest and road building activities, particularly if these alternatives enter the zone of instability of the landslide. Alternatives A/NFMA, G, and H pose more risk of degrading the soil and water resource than Alternatives B, C, D, I and J, and Alternative F, respectively. Intensive timber harvest and road building in the zone of instability could result in significant loss of long term site productivity if the slide was triggered to erode more area. However, since Wenatchee National Forest Best Management Practices (1982) and Forest Plan Standards and Guidelines will be employed, no unique soil and water effects are expected to occur because of forest management in this area.

b. Mitigation Measures

The mitigation measures that will be used in this area are the same as those discussed in Chapter IV - Soil and Water sections.

9. Air

The additional prescribed burning generated in the Slide Ridge roadless area as a result of the alternatives would not have a significant effect on air quality beyond the impacts discussed in Chapter IV.

10. Minerals

Since this area appears to have a low potential for the occurrence of mineral resources, the consequences on mineral resources do not appear to be extremely significant nor do they appear to vary appreciably by alternative. However, the management prescriptions under which the area would be managed in each alternative would restrict mineral activities to varying degrees (i.e., special stipulations in leases and in approved operating plans). The effects of these restrictions cannot be quantified, but the negative influence they would have on interest in conducting exploration activities within the area does vary by alternative and will, therefore, affect the potential for discovering and/or developing any unknown mineral resources of the area. This relative variation between alternatives is depicted on the following table.

Consequences on Mineral Resources

Restrictive Nature of Management Prescriptions	Acres Restricted by Management Prescriptions									
	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
Withdrawn from Mineral Entry (valid existing rights will be determined and recognized)	0	0	0	0	0	0	0	0	0	0
Highly Restrictive	953	2,014	3,456	2,014	10,091	9,243	954	953	3,456	2,020
Moderately Restrictive	7,802	2,353	6,571	2,353	0	806	9,095	7,802	6,571	2,332
Relatively Few Restrictions	1,336	5,724	64	5,724	0	43	42	1,336	64	5,745

11. Roads

The miles of local roads shown below for each alternative are those that are expected to be constructed to permit timber harvest. They are included in the totals for the various alternatives shown in Chapter IV of the FEIS. It is assumed that the bulk of these roads will be constructed within the next 20 years. An analysis of the road development in unroaded areas during the past ten years indicates that for every acre harvested approximately 5.5 acres are accessed. It is assumed that 50 percent of these roads will be closed to public traffic, and that the remainder will be suitable for travel by high clearance vehicles only.

These mileages are estimates based upon typical road densities necessary to harvest timber on different slope classes. The actual road miles that will result from the implementation of the various alternatives will be determined during project planning, design, and environmental analysis. The assumptions made for this analysis will be monitored. The construction of any road will be subject to the appropriate environmental analysis. That analysis will address the effects on resources that are dependent upon a roadless setting, including any adjacent roadless area or wilderness. The decision to close any road will be made on a case-by-case basis, according to the Forest Road Closure Policy found in the Forest-Wide Standards and Guidelines.

	<u>Alternative</u>									
	A/NFMA	B	C	D	E	F	G	H	I	J
			PREFERRED							
Miles	25	23	20	23	0	2	24	25	20	23

12. Fire

The fire management workload generated in the Slide Ridge roadless area as a result of the alternatives will not have a significant effect beyond the effects already described in Chapter IV.

A slight increase in risk of recreation related fires would occur in Alternatives E, F, and G. Additional road access due to increased timber harvest activity would also increase risk of fire in Alternatives A/NFMA, B, D, H and J.

The cost efficiency of fire suppression activities would be slightly increased in Alternatives A/NFMA, B, D, and H as road access would allow more area to be covered by ground-based suppression resources. Cost efficiency levels in Alternatives E, F, and G would be less due to slower initial attack by ground forces or the use of more expensive aerially-delivered resources such as helitack or smokejumpers.

The impacts generated by slash disposal activities are discussed in Chapter IV.

13. Social/Economic

To measure this area in terms of its social value, a basic assumption is being made. This is, because of the expressed interest in keeping as much as possible of the inventoried roadless areas unroaded, the more that condition is reflected, the higher the social value.

This condition is reflected for each alternative in the summary chart under item 1, Recreation, at the beginning of this section (Section V), which indicates the acres of unroaded management.

Also, as there is varying opinion as to the mode of transportation allowed, individuals must judge for themselves which alternative best meets that aspect of the social setting. There is also a summary table, as referenced above, reflecting this condition for each alternative. It indicates the amount of motorized versus non-motorized use within the unroaded allocation.

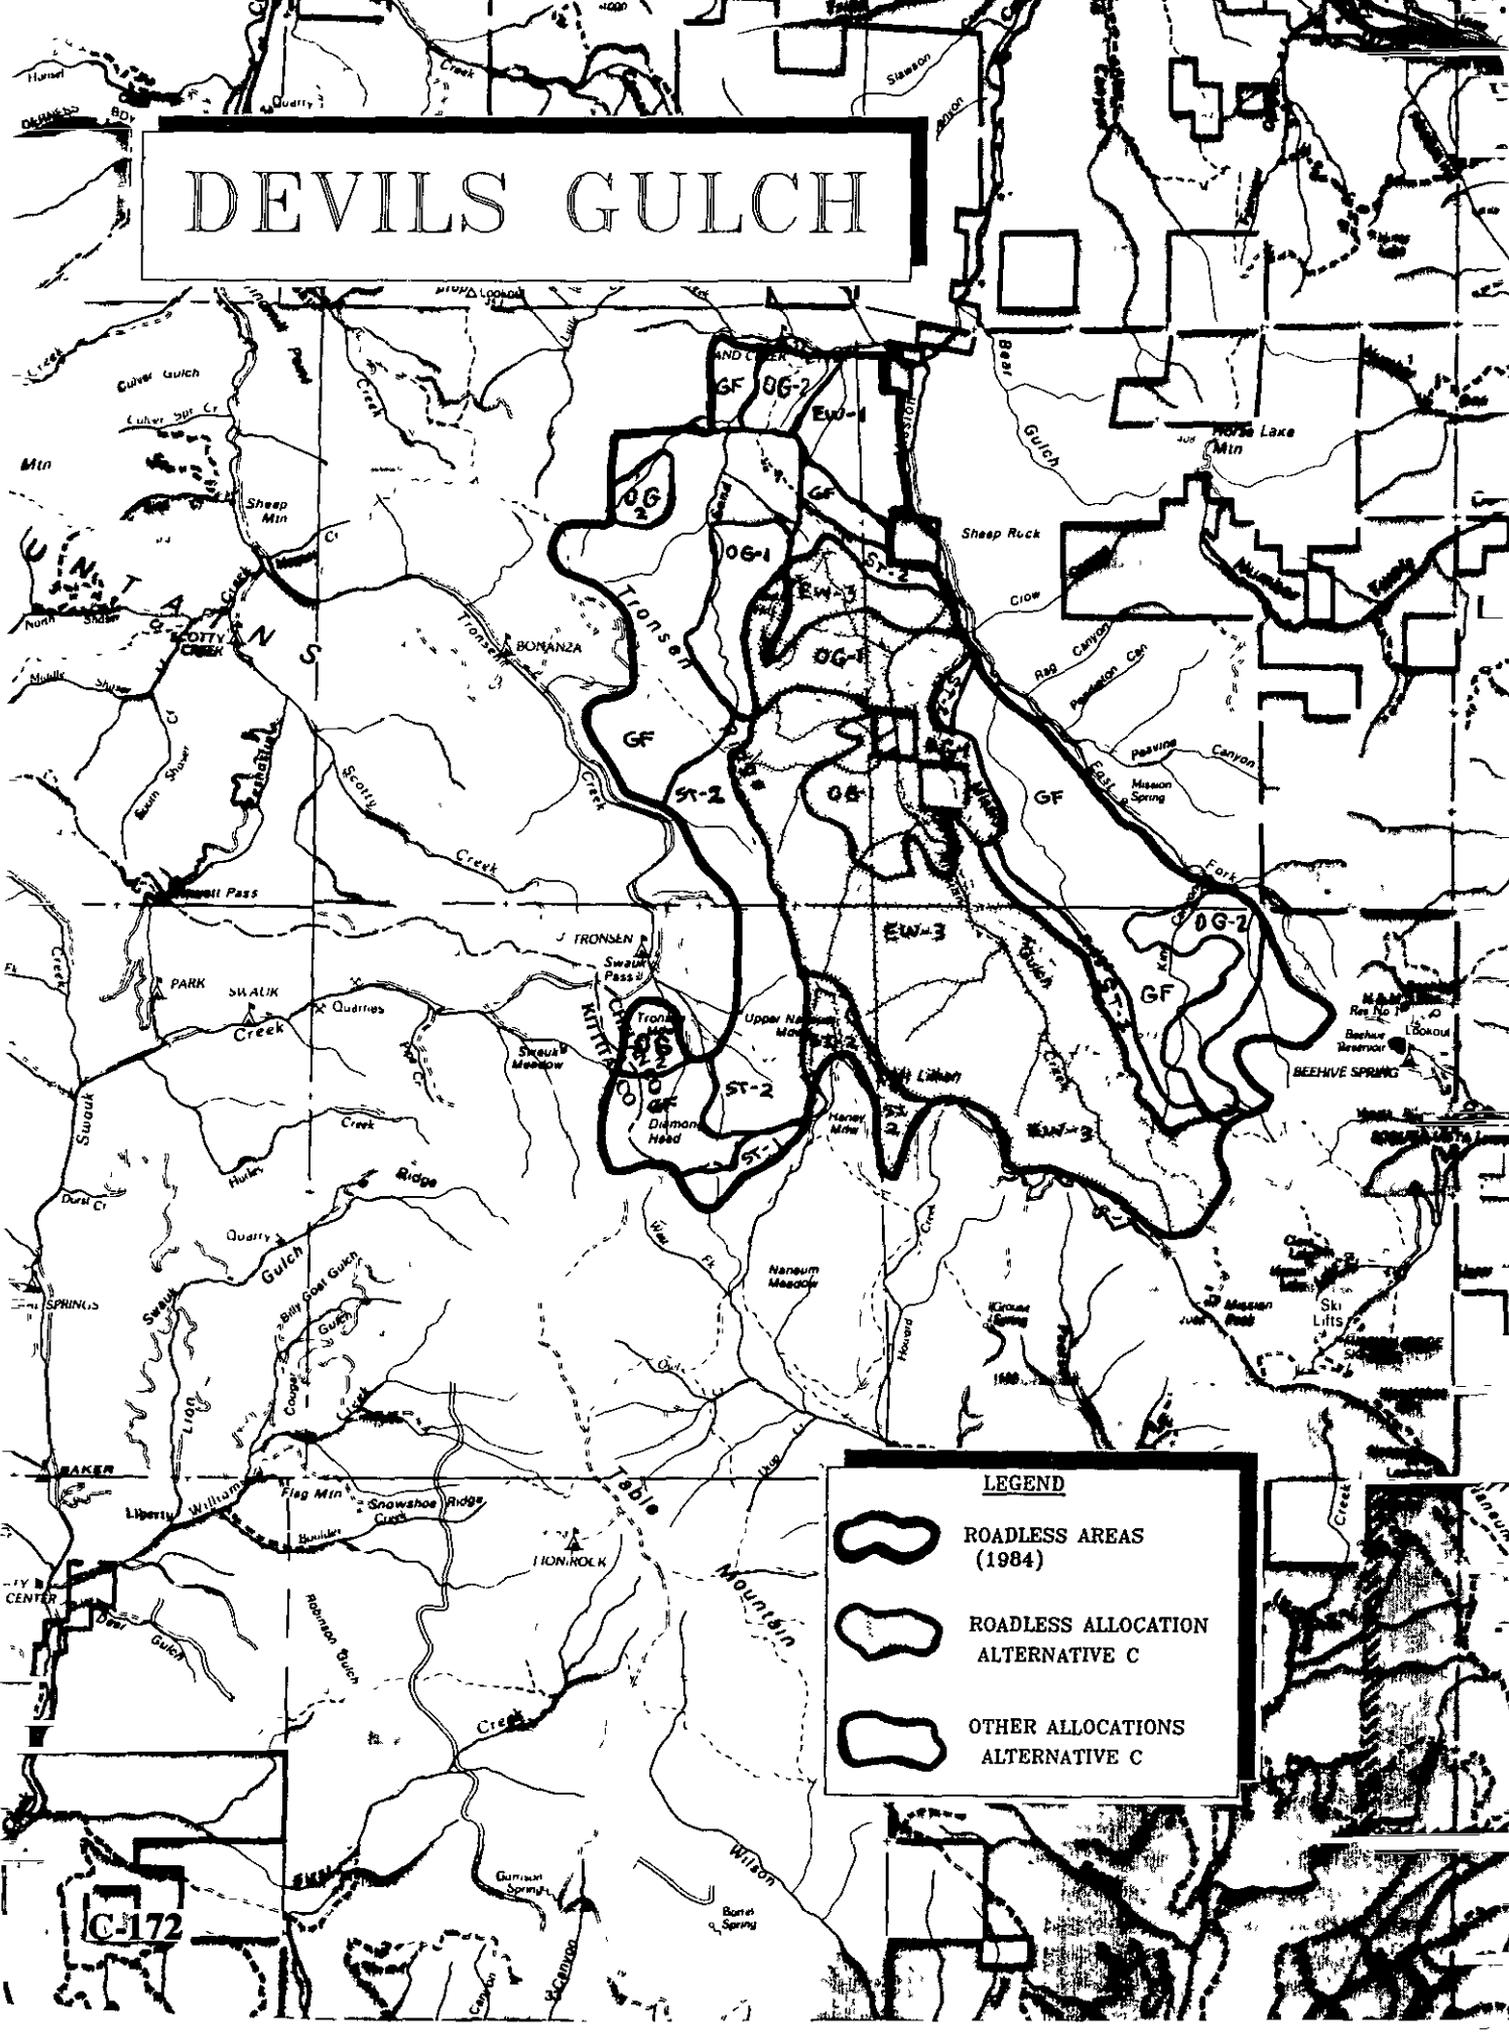

A general measure of timber oriented economic impacts can be made using the same table, which shows the amount of unroaded allocation. The larger the unroaded area, the greater the impact on timber oriented jobs. If all of the estimated long-term sustained yield per year for this area were available, it would support 20.2 jobs.

14. Wilderness Potential

This roadless area has the physical and biological attributes of Wilderness but, due to the location of the area and its proximity to lower Lake Chelan, the opportunities for solitude from human sights and sounds is low.

Alternatives A/NFMA, H, and G retain no unroaded acres but have very low allocations of General Forest. Alternatives E and F provide the greatest retention of natural conditions. Alternatives C and I provide for a balanced allocation of resource values, with emphasis on retention of visual quality. Alternatives B, D, and J allocate a large portion (57 percent) of the area to General Forest. General Forest allocation would prescribe road construction, timber harvesting, vegetative change, and reduction of visual qualities.

DEVILS GULCH

LEGEND

-  ROADLESS AREAS (1984)
-  ROADLESS ALLOCATION ALTERNATIVE C
-  OTHER ALLOCATIONS ALTERNATIVE C

C-172

DEVIL'S GULCH ROADLESS AREA

Size: Gross Acres: 25,186

Net Acres: 25,186

I. GENERAL INFORMATION

A. History

The area was allocated to dispersed, unroaded recreation prior to RARE II through the Chelan Unit Plan. It was not included for wilderness status as part of the Washington State Wilderness Act of 1984 process.

B. Location and Access

The Devil's Gulch roadless area is located approximately 10 miles south of the town of Cashmere, Washington, and is approximately 10 miles west-southwest of Wenatchee, Washington. It lies entirely within Chelan County on the Leavenworth Ranger District of the Wenatchee National Forest. Primary access includes U.S. 97 (Blewett Pass), Mission Creek Road south of Cashmere, and the Squilchuck road and Liberty-Beehive Road south of Wenatchee. The Liberty-Beehive road lies along the southern boundary. A network of trails (Devil's Gulch, Mission Ridge, Red Hill, and Tronsen Meadow) provide access. A small portion along the western edge lies within the Alpine Lakes Management Unit.

C. Physiography and Soils

This area is characterized by steep, rough, angular topography created by large blocks of sandstone bedrock that have been broken and twisted by uplift. The bedded material has no cardinal direction. The dip and strike of the bedding planes vary widely depending upon what part of the area they are in. Vegetative patterns are very distinct, because on most south and southwest facing slopes the plant community is dominated by open stands of ponderosa pine surrounded by a dense carpet of pinegrass, whereas on the north and easterly slopes there are dense stands of Douglas-fir and ponderosa pine. All of the individual drainages are steep and deeply incised.

Elevations range from 1,600 to 6,500 feet. Approximately 90 percent of the soils have formed in Swauk sandstone material and the rest have formed in basaltic residuum. Both materials tend to be slippery and greasy when wet. Puddling and compaction are two of the major problems associated with managing these soils. When these materials are dry, they have excellent bearing strength.

D. Climate

Precipitation averages about 15 to 25 inches per year and occurs mainly as snow.

E. Vegetation

This area has 65 percent tentatively suitable commercial forest area. The primary species are Douglas-fir, ponderosa pine, lodgepole pine, grand fir, and western larch. Early day logging in Mission Creek up to Stump Camps and in King Canyon removed much of the mature timber. Primitive logging roads up stream courses are still evident.

Open south slope areas support bitterbrush shrub areas. Some prescribed burning of bitterbrush and ceanothus stands to improve wildlife browse has been recently completed.

F. Current Uses

The current use is for dispersed recreation. The major activities and their estimated annual use are as follows:

<u>Activity</u>	<u>Estimated Annual Recreation Visitor Days</u>
Motorized Trail Riding	4,000
Hunting	9,800
Hiking	2,000
Total	15,800

The area contains the following Recreation Opportunity Spectrum (ROS) Class:

<u>ROS Class</u>	<u>Acres</u>
Semi-Primitive Motorized (SPM)	25,186

There are 36.7 miles of trail within the area of which all are open to motorized use. The area serves as the major motorbike use site on the Ranger District.

G. Appearance and Surroundings

The area has moderate to high visual variety in landforms, vegetation and rockforms but very little variety in waterforms (lakes and streams). Large rock slides of the Swauk sandstone formation provide contrast within the area.

There is a variety of mixed conifers and larch on the upper slopes near Mount Lilhan, Upper Naneum Meadows, and Diamond Head. The ridgetops are open and have sparse vegetation on their south slopes. Dense vegetation is located in the drainage bottoms.

The area is primarily viewed as both foreground and middleground from the Blewett Pass Highway (Highway 97), the Liberty-Beehive Road, the Mission Creek drainage, and Tronsen Ridge, Mission Ridge, and Devil's Gulch Trails.

The Mission Creek area is surrounded by the Liberty-Beehive Road, Mission Creek, Highway 97, and Little Camas Creek.

H. Attractions

One major drainage, Mission Creek, commonly known as Devil's Gulch, is included in the unit. A well known landmark attraction called Devil's Slide occupies the steep, bare, sandstone bedrock headwall in this drainage.

The portion within the Alpine Lakes Management Area contains features such as Diamond Head and Upper Naneum Meadows.

II. CAPABILITY-WILDERNESS CHARACTERISTICS

A. Manageability and Boundaries

Most of the boundary does not lie on specific identifiable ground features, thus lending to difficulty of management.

B. Natural Integrity

Impacts of past human activity in this area have been relatively minor. A short logging road penetrated up Mission Creek into the area in the '40s. It basically followed the stream bed and is evident only in a few locations with trees up to 8 inches in diameter growing on it. Portions of the trail system are relatively new (early '50s) and were built for motorized two-wheel vehicles. All of the trails in the unit have considerable motor bike use.

C. Natural Appearance

The main Devil's Gulch is relatively remote from population centers and gives a feeling of being away from human activity or development. Views from the unit are relatively free from man's impact such as timber harvest, etc. The large sandstone cliff slide area in the head of the gulch reinforces a feeling of naturalness.

D. Opportunities for Solitude

The area offers good opportunities for solitude due to terrain, vegetative cover, and geologic character.

E. Opportunities for Primitive Recreation

Opportunities for primitive recreation experiences are midrange. The area is not exceptionally large but the absence of facilities contribute to its primitive character. Access is good by roads to the perimeter of the unit and good trail systems occur on the boundaries and in the interior of the unit. There are ample opportunities for big game hunting, horseback riding, hiking, backpacking, and nature study or scenic viewing.

F. Challenging Experiences

The area has marginal opportunities for challenging experiences due to the amount of easy access in the unit. Some opportunity exists for climbing of the sandstone formation.

G. Special Wildlife Features

There have been sightings of peregrine falcon reported but no nesting sites have been located. Spotted owls have been located in this area. Use of the area by any other threatened, endangered, or sensitive species is unknown.

H. Historical and Scientific Study

Some opportunity exists for scientific study in relationship to the geology of the area.

III. RESOURCES AND POTENTIALS

A. Recreation

The area has potential value for unroaded types of recreation activities.

Estimated carrying capacity by ROS Class is as follows:

ROS Class	Capacity in Potential Recreation Visitor Days Per Year
SPM	50,300

B. Wildlife

Lower elevation south slopes in the area provide winter range for a large number of mule deer and some elk. The area is used in the summer by migrating elk from the Colockum unit south of Wenatchee. A variety of other wildlife common to central Washington also inhabit the area. Other species of interest are black bear, goshawk, marten, bobcat, and cougar.

C. Fish

Mission Creek is used by both anadromous and resident fish. It is thought that at one time Mission Creek had one of the largest runs of steelhead trout in the Wenatchee system. Resident cutthroat and rainbow trout also utilize the stream.

D. Water

Water yield records are available for the period between December, 1958 and September, 1971. The stream discharge measurement site is located at the extreme northeast corner of the roadless area, just above its confluence with Sand Creek.

The mean discharge over the 12 years of record was 13 cubic feet/second (cfs). The maximum discharge recorded was 299 cfs--occurring in January 1971. Minimum flow was 0.90 cfs occurring on September 9, 1966. There are no diversions above the stream discharge measurement site.

Sand Creek was also monitored for discharge but records were not continuous. The stream gauging site was located on Sand Creek immediately above the confluence with Mission Creek. The drainage area of 18.6 miles experienced a peak flow of 425 cfs on August 15, 1956. Minimum discharge occurred on September 10, 1955 with 0.4 cfs. There are diversions above this site. The site is no longer maintained by the Geological Survey. There are no precipitation records for the area. The Mission Creek drainage has been subjected to occasional high intensity rainfall and flashy runoff.

E. Livestock

The portion of this area west of Tronsen Ridge is currently within the Tronsen Recreation Stock Allotment, and because the allotment inventory map shows only one relatively small suitable range area, the potential for domestic livestock is limited.

The portion of this roadless area within the Mission Creek drainage is outside of any existing allotments. Vegetative types in the northern part of the drainage have potential for domestic stock use. Lack of

access into forage areas and cost of developing unroaded allotments when other areas are available have resulted in little interest or use by livestock owners. The potential for use by sheep or cattle would be enhanced through timber harvest and roading.

F. Timber

The area contains 16,495 acres of tentatively suitable forest land. Stand, volume, and other data are as follows:

Ecotype	Stand Size	Acres	Estimated Standing Volume (MMBF)	(MMCF)
Wet	Bare Ground	64	---	---
Wet	Mature	2,311	65.5	12.0
Wet	Immature	4,834	86.9	15.9
Wet	Seedling-Sapling	64	---	---
Dry	Mature	2,078	26.0	4.8
Dry	Immature	7,102	69.7	12.9
Dry	Seedling-Sapling	42	---	---
	Total	16,495	248.1	45.6

The estimated maximum biological potential contribution to the long-term sustained yield is 5.0 MM Bd. Ft. (0.92 MM Cu. Ft.) per year.

G. Minerals

This area is underlain by Tertiary and Cretaceous aged sedimentary rocks. A fairly large Tertiary intrusive body lies immediately to the northeast of the subject land, however, which is of interest for its related gold potential. The area has not been investigated by the U.S.G.S. or U.S. Bureau of Mines, but available references indicate that the only known mineral resource occurrences of interest are limited to sandstone deposits. The entire area has been classified "prospectively valuable" for both oil and gas, and coal resources by the U.S.G.S. , and the south half of the area has been nominated as an "area of critical mineral potential" through a Bureau of Land Management nomination process (Bee, 1983).

Even though the area has no proven mineral resources of significant nature, there is interest in the area. According to B.L.M. mining claim recordation data (1/23/85), these have been 966 lode claims and 11 placer claims located within or immediately adjacent to the area. Assessment work appears to have been maintained on most of these claims; however, it is not known whether the claims were located for known deposits or in speculative response to the activities on-going nearer Wenatchee. The area has also been leased for its oil and gas resources, but it has not yet experienced any exploration drilling so its actual oil and gas potential is not known. Presently it does not appear that there is any interest in the potential coal resources of the area.

H. Cultural-Historical

The Tronsen Ridge and Upper Naneum Meadows area of this unit were reportedly used in prehistoric times for travel, food, and the collection of household materials. There are no known archaeological sites, although field survey has been limited. Historic uses include small-scale mining, trapping, and sheep grazing.

I. Land Use

J. Fire

Annual fire occurrence is high with fires primarily started by lightning. Fuel loadings are moderate with intermittent small openings and areas of heavier fuels. Periodic large fires have occurred.

K. Insects and Disease

Due to past removal of the old-growth timber, the stands in this area are less susceptible to bark beetles than most areas.

Budworm feeding occurred in the 1970's but, following aerial spraying in 1977, no budworm feeding has been evident. Mistletoe is present, but less common than in completely unlogged areas.

L. Private Lands

There are no private lands within the area. There are, however, two small parcels of alienated lands within the area which are currently accessed only by foot trail.

IV. NEED

A. Nearby Wilderness and Other Roadless Areas

This area is located within 10 miles from the southeastern portion of the 393,360 acre Alpine Lakes Wilderness Area and just north of the Naneum and Lion Rock roadless areas.

B. Distance from Population Centers

The area is within two to four hours driving time from population centers such as Seattle-Tacoma, Yakima, Tri-Cities, and Wenatchee.

C. Need for Ecosystem Representation

The ecosystem is somewhat unique due to the Swauk sandstone formations in the unit that are fairly widespread in North Central Washington but not represented in other wilderness or wild areas.

D. Interest by Proponents, Including Congressional

Since the passage of the Washington State Wilderness Act of 1984, Congress has not expressed interest in making further additions to the State wilderness system. Environmental organizations have expressed interest in adding portions of the area to the National Wilderness Preservation System in the future.

Both environmental and ORV organizations and users have advocated maintaining roadless status for the area.

E. Public Input

Public input during the unit planning efforts was obtained and supported unroaded allocations.

F. Other Public Involvement

Public input solicited during the formulation of alternatives for this plan indicated much support for dispersed, unroaded recreation use for the area. There is a difference of opinion as to whether it should be motorized or nonmotorized use.

V. ENVIRONMENTAL CONSEQUENCES

A. Environmental Consequences Associated with the Alternatives

1. Recreation

a. Significant Effects

Alternatives B, D and J would not allocate any of the area to roadless management. Under these alternatives, the area would be entered for harvest and all motorized recreation opportunities would be changed from semi-primitive to Roaded Natural or Roaded Modified.

Alternative E represents the current roadless situation. It represents the maximum area (100 percent) available for roadless opportunities, such as motorized trail use, with opportunity for dispersed recreation, non-motorized use.

Alternative F would provide for mostly dispersed recreation unroaded non-motorized opportunities (approximately 90 percent) and allocate approximately 10 percent to unroaded recreation, motorized. This alternative would eliminate approximately 3,600 RVDs of motorized trail use. Opportunities for solitude would increase as motorized use would be restricted.

Alternative G has similar allocations as Alternative E, with the exception being that there is no dispersed recreation, unroaded, non-motorized setting. That allocation would go to roaded eventually with timber harvest and increased roaded motorized recreation opportunities.

Under Alternative C and I, the portion of the trail system in this roadless area is allocated as follows:

Trail Name	Trail Number	Unroaded Non-Motorized	Unroaded Motorized	Roaded Motorized
Mission Ridge	1201.1	--	2.0	--
Tronsen Ridge	1204	--	6.0	2.7
Tronson Meadow	1205	--	--	2.0
Devils Gulch	1220	--	12.3	--
Red Hill	1223	--	--	8.0
Red Hill Spur	1223.1	--	2.2	1.5
Totals		--	22.5	14.2

In these alternatives 32% of the area is allocated to unroaded Big Game habitat. Motorized recreation can occur in this allocation as long as the objectives of Big Game Management are being met.

Alternatives C and I represent a balanced allocation emphasis for all resource values of the Devil's Gulch area.

Alternatives A/NFMA and H would reduce the dispersed recreation, motorized, trails for motorbikes slightly. Some of the trails would run on the boundary of the unit which could potentially conflict with roaded use in the future. Much of the current roadless acreage would be allocated to General Forest

with roads and timber harvest. This would increase opportunities for roaded modified recreation opportunities.

b. Summary

The following tables indicate, by alternative, the degree to which this area will be allocated to roadless management and, of the roadless management acres, what percent is motorized and non-motorized. These represent the Semiprimitive Motorized and Semiprimitive Non-Motorized Recreation Opportunity Spectrum (ROS) Classes. The area being allocated to roaded types of management activities will become Roaded Natural or Roaded Modified ROS opportunities depending on the intensity of development.

Percent of the Area Having Unroaded Allocation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	37	0	39	0	100	87	78	37	39	0

Percent of the Unroaded Allocation Area
In Terms of Motorized/Non-Motorized Recreation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	100/0	0/0	100/0	0/0	21/79	24/76	0/100	100/0	100/0	0/0

The area being allocated to roaded management activities will have increased dispersed roaded recreation opportunities and the possible opening of access to potential developed recreation sites. The trail miles within the area allocated to roaded may provide a less semi-primitive recreation experience with a more Roaded Natural or Roaded Modified setting.

2. Wild, Scenic, and Recreational Rivers

There are none associated with this roadless area.

3. Cultural Resources

Consideration of cultural resource values are required by a special set of historic preservation laws, regulations and policies. Particular efforts will be made in every alternative to inventory, evaluate, and provide for significant cultural resources in areas where Forest management activities are planned.

4. Scenery

Alternatives A/NFMA and H will allocate many areas to Maximum Modification VQO. These areas are the Diamond Head area (Highway 97), Mission Creek, King Canyon, Sand Creek area, and the upper end of the Mission Creek drainage. The middleground view from the Beehive to Liberty travel route will be heavily altered.

Most middleground views from the Blewett Pass area (Highway 97) will be Partial Retention VQO.

Alternatives B, D and J will allocate the majority of the area to Maximum Modification VQO. These areas are the middleground view from the Blewett Pass area (Highway 97), the Mission Creek drainages, Tronsen Ridge, the Beehive to Liberty travel route viewshed, Mount Lilian area, and many trails within the area. Most areas will be heavily altered as viewed from the recreational travel routes.

Alternatives C and I will allocate many areas to Maximum Modification VQO. Areas of heavily altered land will be the Tronsen Ridge and Mission Creek ridge, the middleground view from the Liberty Beehive road, the Mission Creek midslope areas, and a small portion of the Tronsen Ridge middleground viewed from Blewett Pass Area (Highway 97). Only the Devil's Gulch Creek and most of the middle-ground view from the Swauk Pass viewshed will be Partial Retention VQO. The foreground of the Liberty-Beehive Road will have high visual quality.

Alternative E will allocate all areas to Retention VQO. All areas will have natural appearing landscapes. All viewsheds will have very high scenic qualities.

Alternative F allocates most areas to a high visual quality. All major viewsheds will have a very high visual quality. Only a small area will be General Forest or Maximum Modification VQO.

Alternative G will allocate most land to Retention VQO. All major viewsheds will have high visual quality.

The following table summarizes the Scenic component of this area by alternative in acres of Visual Quality Objective (VQO).

VQO	A/NFMA	B	Alternative C		D	Alternative E	F	G	H	I	J
			PREFERRED								
Preservation	--	--	--	--	--	--	--	--	--	--	--
Retention	11,406	3,753	12,868	3,753	25,144	23,918	22,070	11,406	12,868	3,667	
Partial Retention	7,250	3,604	6,319	7,604	--	1,017	2,862	7,250	6,319	3,647	
Modification	--	975	869	975	42	42	42	--	869	1,717	
Maximum Modification	6,530	16,854	5,130	16,854	--	212	212	6,530	5,130	16,155	
Total Acres	25,186	25,186	25,186	25,186	25,186	25,186	25,186	25,186	25,186	25,186	

Preservation indicates that only natural ecological changes will occur.

Retention indicates an essentially natural appearing landscape will be present.

Partial Retention indicates the landscape will be slightly altered.

Modification indicates a moderately altered landscape will be present.

Maximum Modification indicates a heavily altered landscape may be present.

5. Wildlife

Alternatives A/NFMA and H would road 63 percent and allow for timber harvest emphasis on 32 percent of the area. Alternatives B, D and J would road all of the area and allow for timber harvest emphasis in 77 percent of the area. Alternatives A/NFMA and H would have less than one-half the impact on

wildlife habitat of B, D and J. Alternatives C and I would road 61 percent and allow for timber harvest emphasis on 26 percent of the area. These alternatives also have the EW-3 roadless wildlife prescription with no scheduled timber harvest allowed. This would result in less impact than B, D and J. Alternative E would have minimal effect on wildlife habitat. Alternatives F and G would have more effect than E, but considerably less than A/NFMA and H on wildlife habitat.

6. Fisheries

a. Significant Effects

Mission Creek, the only stream with fish populations in this roadless area, would remain roadless in Alternatives A/NFMA, C, E, F, G, H, and I. In Alternatives B, D and J the area around Mission Creek in the roadless area could be managed with an intensive timber harvest regime.

Roading Mission Creek could change its recreational fishing opportunities. Since about two-thirds of the Forest's fishing occurs in roaded areas, it is expected that recreational fishing would increase. This would help to meet a portion of the fishing demand, but also could result in overfishing and reduction in both numbers and size of fish using the habitat. This may be more likely to happen in Mission Creek than other areas because of the population concentration nearby in Wenatchee.

It is also possible that roading the unroaded areas could result in environmental degradation to streams due to timber harvest and road construction in the basins. This is of particular concern in this roadless area since increases in road and timber harvest-produced sediment could have an effect on steelhead production downstream. Some of these possible effects are also addressed in the soil and water environmental effects.

b. Mitigation Measures

In the alternatives that could road the presently unroaded Mission Creek area, the riparian protection zone prescription, the Wenatchee National Forest's Best Management Practices (September 1980 and revised October 1982), and all standards and guidelines common throughout riparian areas of the Forest would be applied in stream zones. This treatment should adequately protect the streams from a reduction in fish habitat capability.

If the areas are roaded, road closures could be implemented to reduce the impact of enhanced access on the native fish populations.

7a. Vegetation: Trees

Tree management would be planned on 11,367 acres, or 45 percent, of the area under Alternatives A and H. Vegetation manipulation would be permitted on 94 percent of the area under Alternatives B, D and H.

No timber management would be scheduled under Alternative E, and only 3,390 acres or 13 percent under Alternative F.

Alternatives C and I would manage 6,635 acres for emphasis on timber production (26 percent). In addition, 7,888 acres could be managed for other resource values that permit scheduled timber harvest. Total suitable forest that would be manipulated through timber sales is 13,759, or 55 percent of the area.

Alternative G emphasizes management to provide scenic travel on 11 percent or 2,713 acres. Timber management would be emphasized on 1,717 acres. Motorized unroaded recreation would be the largest allocation with 19,739 acres or 78 percent of the area.

7b. Vegetation: Forage

There are no existing allotments within this roadless area. The existing and potential forage base, however, will make a significant contribution to the forage needed by big game and livestock from the fourth decade on. Due to the non-occurrence of natural fire and lack of livestock use over the past 10 to 50 years, many forage areas are stocked with trees or high brush and do not provide wildlife forage. With the proposed vegetative manipulation and access, Alternatives C, H, and I will contribute adequate forage for big game and Livestock. Alternatives A/NFMA, B, D, and J will provide forage in excess of needs while Alternatives E, F, and G will not meet forage needs for livestock in the fourth or fifth decades.

8. Soil and Water

a. Significant Effects

The environmental consequences of allocating the Devil's Gulch (Mission Creek) area to General Forest or Roadless Management are discussed by alternative below. No significant soil and water consequences are associated with Alternative E because soil and water disturbing activities occurring would be minimal. Up to 22 percent of the area could be allocated to timber harvest and road building in Alternatives F and G. Alternatives C and I allocate 61 percent. Alternatives A/NFMA, C and H could allocate up to 80 percent of the area, and Alternative B, D and J could allocate the entire area to timber harvest and road building. The environmental effects of timber harvest and road building on soil and water are discussed in Chapter IV - Soil and Water sections.

The risk of degrading the soil and water resource increases with more timber harvest and road building activities, particularly if those activities enter the zone of instability of the landslide at the upper end of Mission Creek. Alternatives B, D and I pose more risk of degrading the soil and water resource than Alternatives A, C, H, and J, and Alternatives F and G, respectively. Intensive timber harvest and road building in the zone of instability could result in significant loss of long-term productivity if the slide were triggered to erode more area. However, since Wenatchee National Forest Best Management Practices (1982) and Forest Plan Standards and Guidelines will be employed, no unique soil and water effects are expected to occur because of forest management in this area.

b. Mitigation Measures

The mitigation measures that will be used in this area are the same as those discussed in Chapter IV - Soil and Water sections.

c. Potential Conflicts with Plans and Policies of Other Jurisdiction

There are 6,996 acres of Burlington Northern Railroad lands adjacent to the area. More timber harvest has occurred on private land in the headwaters of South Fork Manastash Creek, Gold Creek, Mill Creek, and North Fork Wenas Creek drainages than is occurring on National Forest Lands. The Forest Service needs to examine land management practices on adjacent land to consider the possibility of cumulative effects. The analysis of cumulative effects in this area is the same as that discussed in Chapter IV-Soil and Water sections.

9. Air

The additional prescribed burning generated in the Devil's Gulch/Mission Creek roadless area as a result of the alternative would not have a significant effect on air quality beyond the impacts discussed in Chapter IV.

10. Minerals

The area has no proven mineral resources, but it is encumbered by 966 lode claims, 11 placer claims, and by oil and gas leases. It has also been classified prospectively valuable for both oil and gas, and coal, and was identified as an area of critical mineral potential. Since none of the alternatives call for withdrawing any part of the area from mineral entry, the consequences on mineral resources do not appear to be extremely significant nor do they vary appreciably by alternative. However, the management prescriptions under which the area would be managed in each alternative would restrict mineral activities to varying degrees (i.e., special stipulations in leases and in approved operating plans). The effects of these restrictions cannot be quantified, but the negative influence they would have on interest in conducting exploration activities within the area does vary by alternative and will, therefore, affect the potential for discovering and/or developing any unknown mineral resources of the area. The relative variation between alternatives is depicted on the following table.

Consequences on Mineral Resources

Restrictive Nature of Management Prescriptions	Acres Restricted by Management Prescriptions									
	A/NFMA	B	C PREFERRED	D Alternative	E	F	G	H	I	J
Withdrawn from Mineral Entry (valid existing rights will be determined and recognized)	0	0	0	0	0	0	0	0	0	0
Highly Restrictive	12,003	4,494	13,271	4,494	25,186	21,901	20,566	12,300	13,271	4,494
Moderately Restrictive	5,148	1,378	5,280	1,378	0	1,420	2,903	5,148	5,280	2,078
Relatively Few Restrictions	8,035	19,314	6,635	19,314	0	1,865	1,717	8,035	6,635	18,614

11. Roads

The miles of local roads shown below for each alternative are those that are expected to be constructed to permit timber harvest. They are included in the totals for the various alternatives shown in Chapter IV of the FEIS. It is assumed that the bulk of these roads will be constructed within the next 20 years. An analysis of the road development in unroaded areas during the past ten years indicates that for every acre harvested approximately 5.5 acres are accessed. It is assumed that 50 percent of these roads will be closed to public traffic, and that the remainder will be suitable for travel by high clearance vehicles only.

These mileages are estimates based upon typical road densities necessary to harvest timber on different slope classes. The actual road miles that will result from the implementation of the various alternatives will be determined during project planning, design, and environmental analysis. The assumptions made for this analysis will be monitored. The construction of any road will be subject to the appropriate environmental analysis. That analysis will address the effects on resources that are dependent upon a roadless setting, including any adjacent roadless area or wilderness. The decision to close any road will be made on a case-by-case basis, according to the Forest Road Closure Policy found in the Forest-Wide Standards and Guidelines.

	<u>Alternative</u>									
	A/NFMA	B	C	D	E	F	G	H	I	J
			PREFERRED							
Miles	37	47	37	47	0	6	11	37	37	47

12. Fire

The fire management workload generated in the Devil's Gulch/Mission Creek roadless area as a result of the alternatives will not have a significant effect beyond the effects already described in Chapter IV.

A slight increase in risk of recreation related fires would occur in Alternatives C, E, F, G and I. Additional road access due to increased timber harvest activity would also increase risk of fire in Alternatives A/NFMA, B, D, H and J.

The cost efficiency of fire suppression activities would be slightly increased in Alternatives A/NFMA, B, D, H and J as road access would allow more area to be covered by ground based suppression resources. Cost efficiency levels in Alternatives C, E, F, G and I would be less due to slower initial attack by ground forces or the use of more expensive aerial delivered resources such as helitack or smokejumpers.

The impacts generated by slash disposal activities are discussed in Chapter IV.

13. Social/Economic

To measure this area in terms of its social value, a basic assumption is being made. This is, because of the expressed interest in keeping as much of the inventoried roadless areas as possible in an unroaded condition, the more that condition is reflected, the higher the social value.

This condition is reflected for each alternative in the summary chart under item 1, Recreation, at the beginning of this section (Section V), which indicates the acres of unroaded management.

Also, as there is varying opinion as to the mode of transportation allowed, individuals must judge for themselves which alternative best meets that aspect of the social setting. There is also a summary table reflecting this condition for each alternative as referenced above which indicates the amount of motorized versus non-motorized use within the unroaded allocation.

A general measure of timber-oriented economic impacts can be made using the same table referenced above showing the amount of unroaded allocation. The larger the unroaded area, the greater the impact on timber-oriented jobs. If all of the estimated long-term sustained yield per year for this area were available, it would support 61.8 jobs.

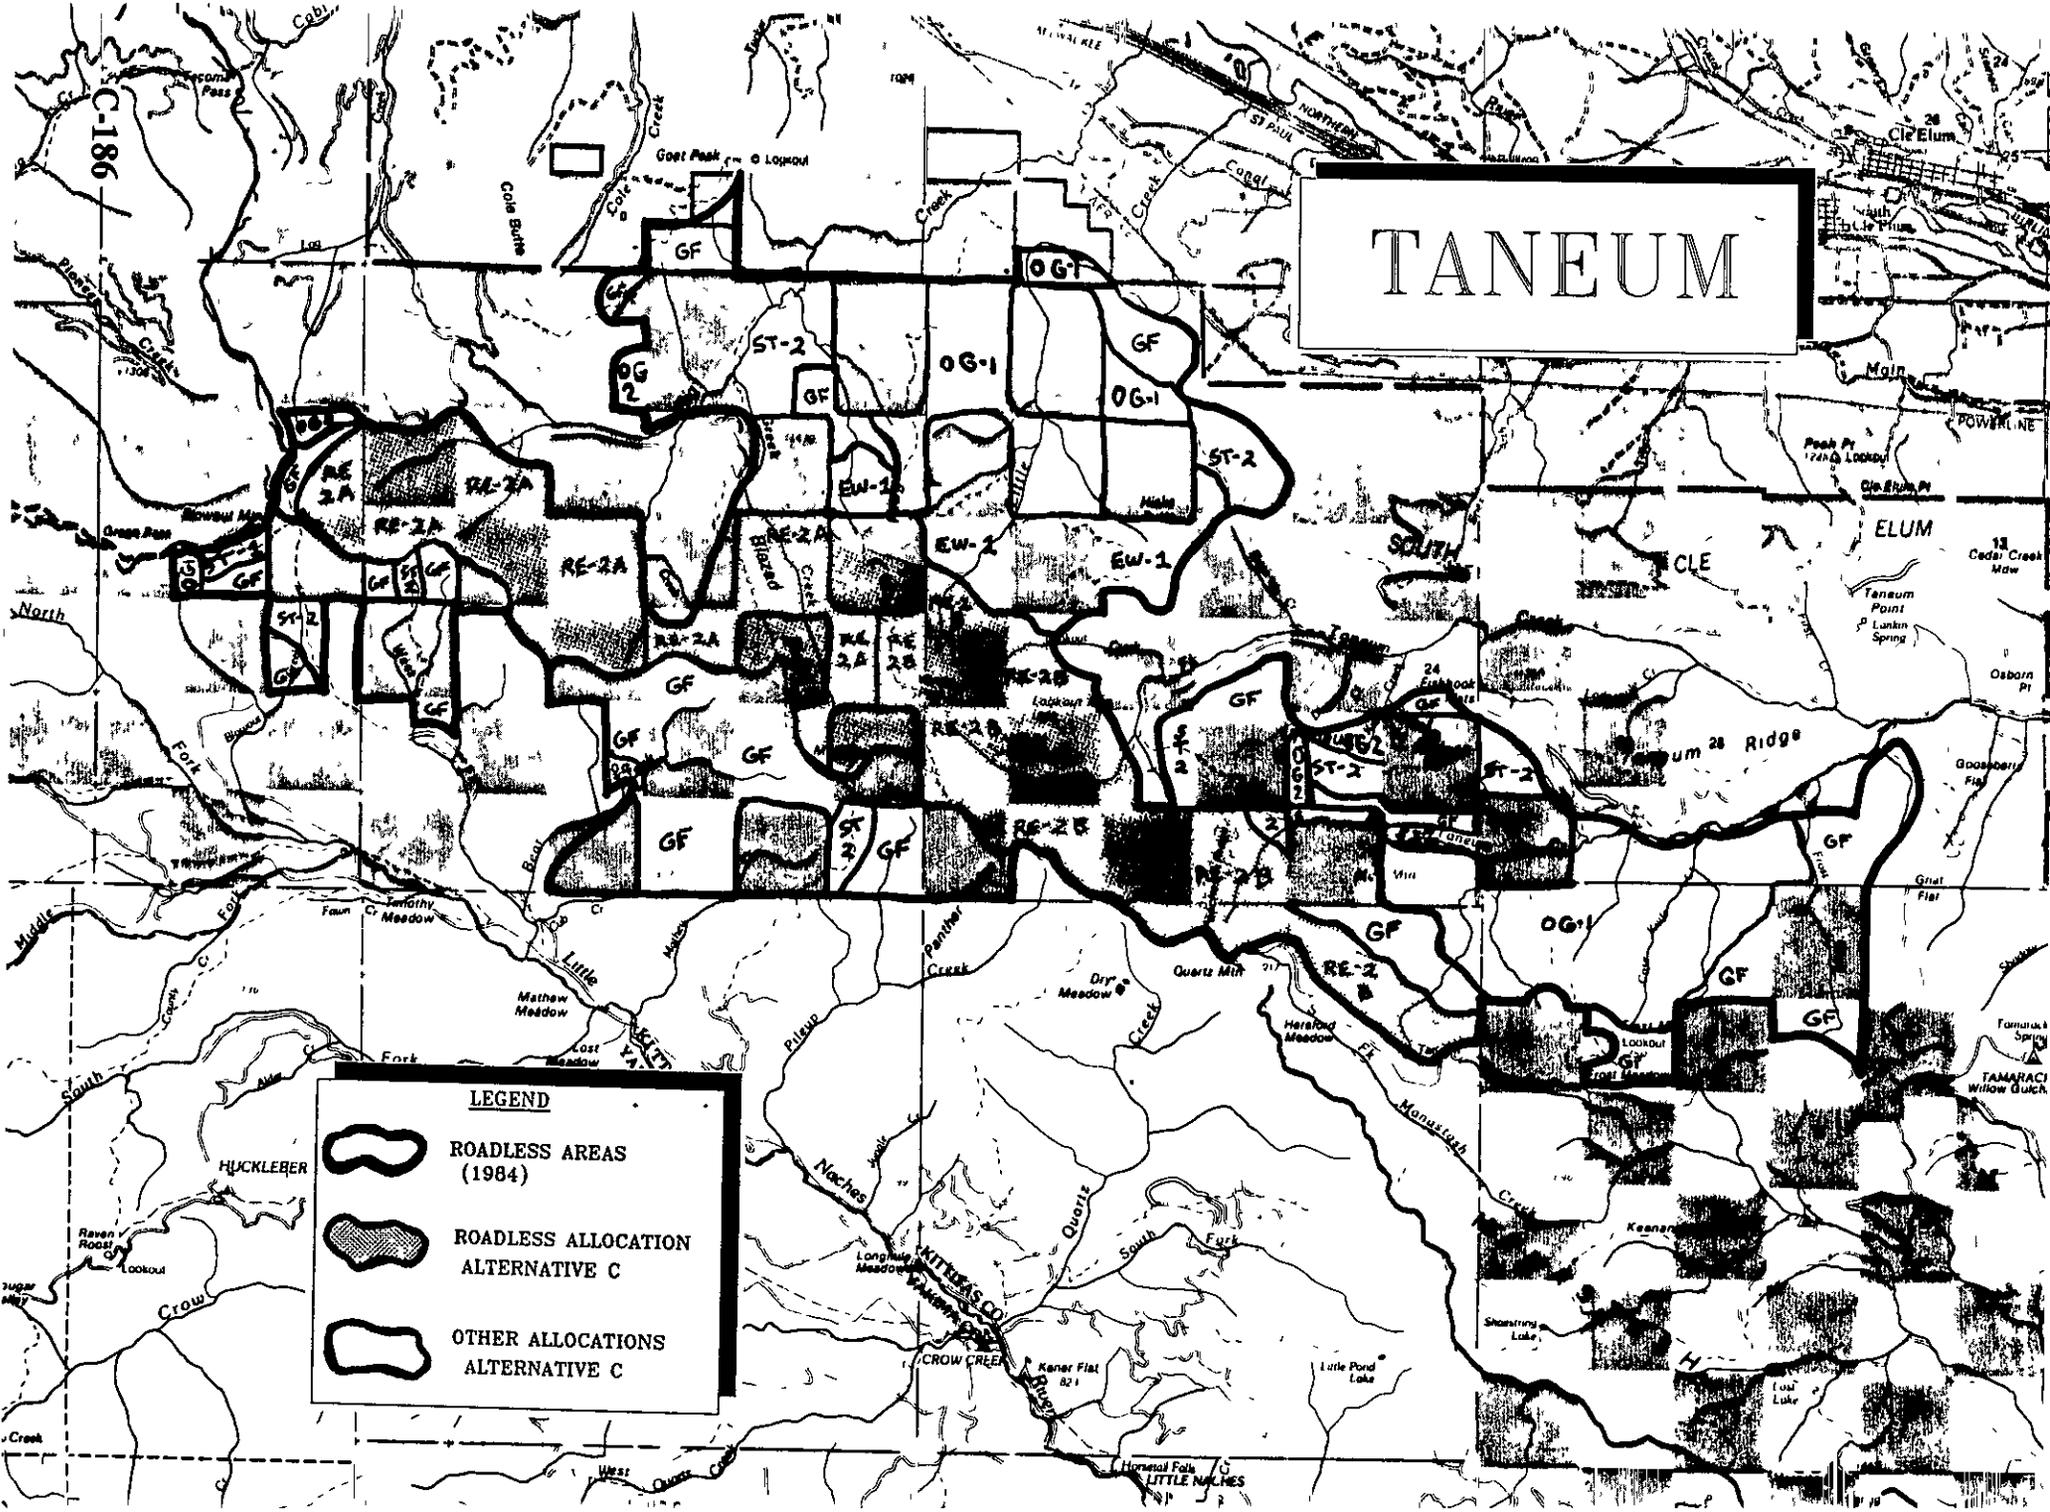

14. Wilderness Potential

The roadless area has limited potential for Wilderness. It is not adjacent to any existing Wilderness and is of relative small size although many Wilderness attributes are characteristic of the area. Alternatives B, D, and J prescribe the greatest change in natural attributes with no roadless area retained. About 18,360 acres would be managed as General Forest, which is 73 percent of the area. Alternatives E, F, and G prescribe the greatest retention of unroaded characteristics. Alternatives C and I prescribe a balance of prescriptions with 6,635 acres in General Forest. Alternatives A/NFMA and H prescribe a greater area retained in unroaded, but 8,035 acres allocated to General Forest. Under General Forest, the area would be highly modified, roads constructed, and timber management activities present.

TANEUM

LEGEND

-  ROADLESS AREAS (1984)
-  ROADLESS ALLOCATION ALTERNATIVE C
-  OTHER ALLOCATIONS ALTERNATIVE C

TANEUM ROADLESS AREA

Size: Gross Acres: 43,257

Net Acres: 25,122

I. GENERAL INFORMATION

A. History

The area was not considered as roadless until the Forest's inventory in the fall of 1983. It did not meet the RARE II definition due to large amounts of mixed ownership, which is still the case. It is being addressed due to expressed public interest in it remaining unroaded.

B. Location and Access

The area is within Kittitas County and lies on both the Cle Elum and Naches Ranger Districts and is adjacent to the Quartz Mountain and Manastash roadless areas. Access is mainly via the Quartz Mountain and Taneum Roads.

C. Physiography and Soils

The upper elevations can be considered as a narrow, gently rolling plateau. Then on either side of the plateau the slopes are steep, but smooth and fairly uniform. The entire unit is well stocked with conifers.

Elevations range from 3,000 to 6,000 feet . There are several different soil types in this area, so the management may be complicated by the pattern and arrangement of the different soils. Twenty-seven percent of the soils have developed in granitic residuum, 21 percent from sandstone, 19 percent from schist, and the remainder from alluvium and serpentine materials. The granitic materials and the alluvium generally are not sticky or slippery when wet and have good bearing strength. The sandstone, basalt, and pyroclastic materials all are fine when dry; however, all are sticky and slippery when wet. Soils formed in schist materials can have characteristics that resemble the other two main groups depending upon the specific kind of schist.

D. Climate

Annual precipitation in this roadless area is estimated to be 45 inches with approximately 50 percent falling as snow. Snow depths are estimated to average 80 inches.

E. Vegetation

Seventy-four percent of this area is tentatively suitable timberlands. Because this area is presently alternate sections of National Forest and Plum Creek Timber land, it is currently being roaded and the mature timber on the private lands removed. The species most common to the area is Douglas-fir. However, as this area extends from the crest of the Cascades to 22 miles to the east along Manastash Ridge, most of the species common to the Wenatchee are found in this area. Old burn areas are mostly reforested to pole size stands with only about three percent of the area in regeneration with seedlings or sapling size trees.

Only eight percent of the area is in open rock or meadows, making this the heaviest timbered roadless area. A low productivity, open grown alpine forest occupies another 14 percent of the area.

F. Current Uses

The current use is for dispersed recreation. The major activities and their estimated annual use are as follows:

<u>Activity</u>	<u>Estimated Annual Recreation Visitor Days</u>
Trailbike and 4X4 Use	5,000
Hunting	10,000
Total	15,000

The area contains the following kinds and amounts of Recreation Opportunity Spectrum (ROS) Classes:

<u>ROS Class</u>	<u>Acres</u>
Semi-Primitive Non-Motorized (SPNM)	7,527
Semi-Primitive Motorized (SPM)	17,595
	25,122

There are 124.0 miles of trail within the area of which all are open to motorized use. The area is also popular for 4X4 vehicle activities. Trail management on the area is made difficult due to the large amount of checkerboard ownership.

G. Appearance and Surroundings

The area has moderate visual variety in landforms, vegetation, rockforms, and waterforms (lakes and streams). The ridgetops have moderate to high visual variety.

The area has steep, highly textured north and northeast slopes with open ridgetops (mostly along the south exposed ridges). The ridgetops from Quartz to Clifty and Blowout Mountains are open with sparse vegetation and rock outcrops throughout. The north and northeast slopes are dissected with streams. Fall colors are prevalent along the upper ridges. Dendritic stream patterns are present in the upper North Fork Taneum creek drainage.

The area is primarily viewed as foreground and middleground from the Quartz Mountain Road, ridgetop trails, the Pacific Crest National Scenic Trail, and other trails. A portion of the area is viewed as middle-ground and background from the I-90 highway. The background viewing is from the Raven's Roost area.

The Taneum Area is surrounded by portions of Big Creek, Taneum Creek and Taneum Ridge, the Gnat Flat and the Quartz Mountain road, the upper drainages of Little Naches, and the Pacific Crest National Scenic Trail.

H. Attractions

Major attractions within the area are Mount Clifty, Taneum Lake, and the Big and Little Creek drainages.

II. CAPABILITY-WILDERNESS CHARACTERISTICS

Since the area lies on both the Cle Elum and Naches Ranger District, this section discusses these characteristics by District.

A. Manageability and Boundaries

Cle Elum:

This area is bordered on the south by a major ridge system and highlighted by three prominent peaks. Blowout Mountain, Mount Clifty and Quartz Mountain. The boundary then meanders toward the east in the vicinity of Manastash Road, then northerly in the vicinity of Gnat Flat Road, to Taneum Creek, then westerly along the South Fork of Taneum Creek and the Fishhook Flats Road to an area near Lookout Mountain. The boundary then meanders in a northerly direction toward Hicks Butte and on to the powerline corridor, then westerly along section lines and the Forest boundary to Coal Creek. The boundary then meanders southerly in the vicinity of Big Creek to Blazed Ridge and westerly to the Forest boundary. The boundary is not easily identified on the ground except when it follows ridge lines or streams. The entire area is in mixed ownership. Future management of public lands will be influenced by the management activities of the private land owner.

Naches:

The Taneum roadless area south of Manastash Ridge is bordered by Forest roads and timber harvest units. These features would be difficult to locate on the ground or map. These roads bring the sights and sounds of human intrusion into the fingers and periphery of the roadless area.

B. Natural Integrity

Cle Elum:

Due to the checkerboard ownership pattern of this area, long term natural processes are expected to be heavily influenced by actions of the private landowner. Trails 1388, 1318, 1333, 1321, 1326, 1377, 1367, and 1363 dissect this area. The area is heavily used by motorcycle riders. Continued encroachment by roads is expected in the management of private sections.

Naches:

This roadless area was not considered for Wilderness in RARE II because of the large amount of checkerboard ownership. The area is bordered by both private and government roads and timber harvest units which reflect man's activities. Within the area, past human activity has been relatively minor even though some of those activities have been extensive. The trail system provides access to Manastash Ridge at many points. This trail system has a long history of motorized vehicle use.

C. Natural Appearance

Cle Elum:

The area retains its natural appearance except for the direct impact of the network of trails. Management activities on adjacent lands are strongly evident from the numerous vantage points throughout this area. Over the long- term, it is expected that management on private lands will alter this situation.

Naches:

The Taneum roadless area is large enough and the topography and vegetation are such that persons visiting the area feel that they are in a natural area away from ordinary human activity and development. Forest roads, timber harvest activities, fire lookouts and the Raven Roost Microwave site may be seen from higher points within the area. Most of the area has a closed evergreen canopy which reinforces a feeling of naturalness even though it is somewhat monotonous.

D. Opportunities for Solitude

Cle Elum:

There is a moderate opportunity for solitude in this area if a person is willing to leave the roads and trails. Most of the trails are heavily used by motorcyclists. The best opportunity for solitude is during the winter when access is difficult and the area is little used by snowmobiles.

Naches:

The area offers some opportunities for solitude. The area has an irregular shape approximately 13 miles long and 4 miles wide at its widest point. This includes the portion of the Taneum roadless area south of Manastash Ridge. Blowout Creek and Bear Creek drainages are the principal drainages. The area contains moderately dissected topography and a fairly even cover of vegetation which easily screens people from each other at short distances.

E. Opportunities for Primitive Recreation

Cle Elum:

Primitive recreation opportunities are moderate to low, except during the winter. Portions of the area are a mile or less from any road or trail. During the snow season the area is inaccessible except for over-the-snow vehicles and on foot. The majority of the area is inaccessible to snowmobiles due to the steepness of the terrain.

Naches:

Opportunities for primitive recreation experiences are moderately high. The size of the area and the absence of facilities contribute to the primitive character of the area. In spite of the good access afforded by Forest roads and the trail system within the area, there are good opportunities for big game hunting (elk, deer, black bear and some mountain lion), horseback riding, hiking, berry picking, and scenic viewing from high points.

F. Challenging Experiences

Cle Elum:

The geography of this area lends itself to a few challenging opportunities during the summer season. There are a few moderate peaks and some cliffs and canyons. Some of the trails offer a challenge to motorcyclists. The winter season offers ample opportunity to the ski tourer, snowshoer, and snowmobiler. Snow depth on the area varies from three feet to ten feet and the nearest plowed access is two miles on the north.

Naches:

This area offers few challenging experiences. The dense evergreen forest might be challenging to travel through for the more inexperienced visitor. A proposed 50 mile Boy Scout hike goes through this area. Present Wilderness regulations limit group size and discourage the continuation of the traditional 50 mile scout hike. Fifty mile hike opportunities for large groups are almost impossible to provide on the Forest with the 1984 expanded Wilderness.

G. Special Wildlife Features

There have been sightings of peregrine falcon reported but no nesting sites have been located. No other threatened or endangered species have been located in the area. The extent of use in this area by sensitive species is unknown. Spotted owls have been located within the area.

H. Attractions

There are good opportunities for outdoor education and scientific and historic study in the area for archeological purposes.

III. RESOURCES AND POTENTIALS

A. Recreation

The area has potential value for unroaded types of recreation activities.

Estimated carrying capacity by ROS class is as follows:

<u>ROS Class</u>	<u>Capacity in Potential Recreation Visitor Days Per Year</u>
SPNM	7,500
SPM	52,800
Total	60,300

B. Wildlife

The area is summer habitat for a large elk herd and also support some mule deer and other forest animals and birds.

C. Fish

Taneum is the only lake in this roadless area. The lake has been regularly planted with cutthroat and other trout species. Fishing is very popular because of its proximity to roads.

There are a number of streams in this area, of which only a few support fishable populations.

The South Fork of the Taneum is utilized by rainbow and cutthroat trout, although it is not very productive. The Taneum is occasionally dewatered by irrigation users below the Forest boundary.

First and Case Knife Creeks, tributaries to the South Fork of the Taneum, are steep and have very low seasonal flows. Small numbers of native cutthroat trout are probably present in both streams.

Below the Forest boundary, Little and Big Creeks have potential for anadromous fish off-channel (Yakima River) rearing. On the Forest, there are only minor populations of resident trout.

This area also includes the headwaters of the Little Naches, Bear Creek, and Blowout Creek. Blowout and Bear Creeks produce native wild populations of cutthroat trout. These are in essentially pristine condition.

D. Water

There is currently a withdrawal for a 68 acre proposed impoundment in the SW 1/4 of Section 32, T19N, R15E WM. The application was forwarded by a F.S. Ward on June 13, 1908, and is subject to reservation by the U.S. Department of Interior.

This impoundment was never constructed but remains an encumbrance on the land. Precipitation averages 45 inches annually with an estimated 50 percent falling as snow. Runoff records are available but incomplete. A gauging station existed "near Thorp, Wa." in 1909-1910. Since then, there has been only miscellaneous discharge measurements. There are no official precipitation gauges or snow survey sites in this roadless area.

E. Livestock

The majority of this roadless area lays within three existing allotments. The eastern one-fourth of the area is in the Manastash Cattle Allotment, however, allotment maps do not show much usable existing forage in the roadless portion. Timber harvest would greatly enhance the potential for domestic livestock.

The remaining three-fourths of this area is within the Taneum, the Little Naches, and the Crest Trail Recreation Stock Allotments. Allotment inventory maps show only very scattered small usable forage areas except near Lookout and Blowout Mountains. All forage areas are currently used by recreation stock in the summer and fall. The potential for domestic stock use in this roadless area is very low without timber harvest and improved access.

F. Timber

The area contains 18,613 acres of tentatively suitable forest land. Stand, volume, and other data are as follows:

Ecotype	Stand Size	Acres	Estimated Standing Volume (MMBF)	(MMCF)
Wet	Bare Ground	64	---	---
Wet	Mature	6,869	194.7	35.7
Wet	Immature	10,621	191 0	35 0
Wet	Seedling-Sapling	127	---	---
Dry	Mature	466	5.8	1.1
Dry	Immature	445	4.4	8
Dry	Seedling-Sapling	21	---	---
	Total	18,613	395.9	72 6

The estimated maximum biological potential contribution to the long term sustained yield is 6.1 MM Bd. Ft. (1.1 MM Cu. Ft.) per year, in addition to Plum Creek Timber Company sales.

G. Minerals

The geology of the area is very complex consisting of folded and faulted metamorphic rocks of Paleozoic and Mesozoic age, Mesozoic granitic rocks, Tertiary nonmarine sedimentary rocks, and Tertiary intrusive and volcanic rocks. The area has not been investigated by the U.S.G.S. or U.S. Bureau of Mines, but available references indicate it may have occurrences of chromium, cobalt, nickel, copper, iron and manganese, the significance of which is not known. A majority of the area is classified "prospectively valuable" for coal; the eastern tip is classified "prospectively valuable" for oil and gas; and the western-most 600 acres are classified "prospectively valuable" for geothermal resources. The southeast portion of the area is subject to an existing oil and gas lease, but there are no pending applications for any of the leasable commodities. Bureau of Land Management records (1/23/85) indicate that there were 68 lode claims and one placer claim located within the area. Sixty-five of those are considered abandoned for lack of assessment work.

H. Cultural-Historical

This area encompasses several known archaeological sites and possesses exceptionally high cultural resource sensitivity. A major prehistoric travelway passes through the area. Along its western margins is a locality of present cultural concern to the Yakima Nation. Historically, the area includes sheep allotments dating from the turn-of-the-century as well as the sites of the former Big Creek (1931-1955) and North Ridge (1932-1955) Lookouts. Documents' research and further field study will undoubtedly augment the limited information available to date.

I. Land Use

J. Fire

Annual fire occurrence is moderate; fuel loadings are moderate and often broken by small meadows and openings. Periodic large fires have occurred.

K. Insects and Disease

The eastern portion of this area was heavily impacted by the spruce budworm in 1974-1977. Root rots and mistletoe are especially damaging in the Taneum and Little Creek drainages.

Stands nearer the crest of the Cascades have much fewer insect and disease problems. However, wind damage and blowdown have periodically occurred in the silver fir-hemlock stands.

L. Private Lands

There are 18,135 acres of "checkerboard" Burlington Northern Railroad lands. Some of this is managed by the Plum Creek Timber Company and accessed from the outside, but further access is planned. Opportunities for exchange are considered fair. Little discussion about exchange has occurred in the past but more is planned for the near future. Other information on these lands is as follows:

In T.19N., R14E., W.M., Burlington Northern proposed to construct a road this year which will come off the Spex Arth road in Section 16 and will access Sections 17 and 18.

In the same township and range, Burlington Northern extended roads from Section 21 through Sections 28, 33, and 27, and a spur into Section 29 in 1984.

In T.18N., R15E., there are now existing Burlington Northern roads in Sections 2 and 3.

In T.19N., R.15E., W.M., Burlington Northern has roaded Section 35.

IV. NEED

A. Nearby Wilderness and Other Roadless Areas

This area is located within a few miles of the Alpine Lakes (393,360 acres), Norse Peak (50,923 acres), William O. Douglas (167,195 acres), and Goat Rocks (105,633 acres) Wildernesses and is adjacent to the Quartz Mountain and Manastash roadless areas.

B. Distance from Population Centers

The area is within two to four hours driving time from population centers such as Seattle-Tacoma, Yakima, Tri-Cities, and Wenatchee.

C. Need for Ecosystem Representation

There are no special or unique ecosystems within the area in need of representation through wilderness classification.

D. Interest by Proponents, Including Congressional

There has been no interest for additional wilderness classification for this area by proponents or Congressional factions.

However, there have been proposals by both environmental and off-road vehicle users to maintain roadless status for the area.

E. Public Input

Local area Scout leadership is interested in a continuous 50 mile non-wilderness hike which traverses this area. There has been no interest in other classifications to date.

F. Other Public Involvement

Public input solicited during the formulation of alternatives for this plan indicated much support for dispersed, unroaded recreation use for the area.

There is a difference of opinion as to the area being for motorized or nonmotorized use.

V. ENVIRONMENTAL CONSEQUENCES

A. Environmental Consequences Associated with the Alternatives

1. Recreation

a. Significant Effects

The Taneum roadless area consists of 25,122 acres and is located within Kittitas County, adjacent to the Quartz Mountain and Manastash roadless areas. Approximately 18,600 acres are inventoried as available and tentatively suitable for timber harvest. Approximately 7,000 acres are inventoried for wildlife management.

The roadless area has been inventoried according to the Recreation Opportunity Spectrum (ROS). The inventory shows that the area is primarily capable of providing Motorized, Dispersed Recreation, with a lesser amount of Non-motorized, Dispersed Recreation. The entire area is in a “checkerboard” pattern of ownership. Continued development of access into private lands will restrict opportunities for Non-motorized, Dispersed Recreation, although significant portions of the area have difficult access and will likely remain unroaded. Approximately 90 percent of the area is capable of providing Motorized, Dispersed Recreation, under a no-harvest management scheme. At the other extreme, approximately 10 percent of the area would provide opportunities for Motorized, Dispersed Recreation, if maximum harvest potential were realized.

Alternatives E and F would allocate eight and five percent of the area, respectively, to Non-motorized, Dispersed Recreation. Under these alternatives there would be no harvest activities in the area. Approximately 90 percent of the area would be allocated to Motorized, Dispersed Recreation. The recreation emphasis would be shifted primarily to trailbike and 4x4 use on the challenging terrain this area has to offer. The natural character of the area would be reduced as the network of trail systems increases.

Alternatives A/NFMA through D, and G through J, allocate between 10 and 25 percent of the area to Motorized, Dispersed use with none of the area being allocated to Non-motorized use. Under this strategy the trail system would remain similar to the current situation. Heavy use of the trail system would continue and change proportionately to the increases and decreases in trail mileage of the various alternatives.

Under Alternatives C and I, the portion of the trail system in this roadless area is allocated as follows:

Trail Name	Trail Number	Unroaded Non-Motorized	Unroaded Motorized	Roaded Motorized
Blowout Mtn.	1318	--	2.3	--
North Ridge	1321	--	2.0	7.5
S. Cle Elum Ridge	1326	--	2.0	13.1
Granite Creek	1326.1	--	--	2.3
Red Mtn.	1330	--	6.7	--
Blazed Ridge	1333	--	3.6	--
Little Creek Basin	1334	--	--	5.0
Taneum Ridge	1363	--	--	11.8
Frost Mtn.	1366	--	--	3.7
Frost Mtn. Lookout	1366.1	--	--	0.3
Frost Water	1366.2	--	--	0.5
SF Taneum	1367.1	--	--	5.3
NF Taneum	1377	--	--	15.7
Lightning Point	1377.2	--	--	2.6
Fishhook Flat	1378	--	--	4.2
Manashtash Ridge	1388	--	18.7	--
Bear Creek	943	--	--	7.0
Little Bear Creek	943.1	--	--	2.5
Cub Creek	943.2	--	--	1.6
Mt Clifty	947	--	--	5.6
Totals			35.3	88.7

Potential Conflicts with Plans and Policies of Other Jurisdictions.

The pattern of private ownership within this area poses severe restrictions on recreation management. Trails continuously cross in and out of private ownership. The private landowner's management does not consider trail access as more than incidental to timber harvest. There is no obligation for the private landowner to protect or construct trails on their lands. Ability to manage the system is limited since only the segments located on National Forest administered lands are under control of the agency.

b. Summary

The following tables indicate, by alternative, the degree to which this area will be allocated to roadless management and, of the roadless management acres, what percent is motorized and non-motorized. These represent the Semiprimitive Motorized and Semiprimitive Non-Motorized Recreation Opportunity Spectrum (ROS) Classes. The area being allocated to roaded types of management activities will become Roaded Natural or Roaded Modified ROS opportunities depending on the intensity of development

Percent of the Area Having Unroaded Allocation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	25	10	28	10	100	95	34	25	28	0

Percent of the Unroaded Allocation Area
In Terms of Motorized/Non-Motorized Recreation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	100/0	100/0	100/0	100/0	92/8	94/6	100/0	100/0	100/0	0/0

The area being allocated to roaded management activities will have increased dispersed roaded recreation opportunities and the possible opening of access to potential developed recreation sites. The trail miles within the area allocated to roading may be reduced as road construction occurs. The roadless character of these portions would also be lost.

2. Wild, Scenic, and Recreational Rivers

There are none associated with this roadless area.

3. Cultural Resources

Consideration of cultural resource values are required by a special set of historic preservation laws, regulations and policies. Particular efforts will be made in every alternative to inventory, evaluate, and provide for significant cultural resources in areas where Forest management activities are planned.

4. Scenery

Alternatives A/NFMA and H will allocate approximately one-third of the areas each to Retention, Partial Retention, and Modification VQO. The upper end of ridgetops will be Retention VQO and most trails outside of the intermingled ownership lands will be Partial Retention VQO. The Taneum Creek area will be Maximum Modification VQO.

Alternatives B, D and J will allocate the majority of the land to Maximum Modification VQO. These areas are the Quartz Mountain to Blowout Mountain foreground and middleground areas. The existing off-road-vehicle trails will be heavily impacted. Some trails will be allocated to Retention VQO.

Alternatives C and I will allocate approximately one-half of the areas to Retention, and the other areas to Partial Retention and Maximum Modification VQO. The Quartz Mountain to Blowout Mountain area will have a wider area of Retention VQO. Most trails in the area will be allocated to Scenic Travel Partial Retention VQO. However, the middleground areas from the trails will be Maximum Modification.

The Naches drainage parts of Bear Creek Basin and the middleground of the Taneum Creek trails will be heavily altered.

Alternative E will allocate all areas to Retention VQO. All areas will have natural appearing landscapes. The scenic qualities of the area will be retained.

Alternative F will allocate most areas to Retention VQO. The Blowout Mountain along the Crest will be allocated to Preservation VQO. The rest of the area will have high visual quality.

Alternative G will allocate a little over one-half of the area to Retention and the rest of the area to Partial Retention and Maximum Modification. The foreground of trails will mostly be allocated to Retention VQO. The middleground will be generally managed as Maximum Modification VQO.

The following table summarizes the Scenic component of this area by alternative in acres of Visual Quality Objective (VQO).

VQO	A/NFMA	B	Alternative							
			C PREFERRED	D	E	F	G	H	I	J
Preservation	--	--	--	--	--	--	--	--	--	--
Retention	14,628	10,048	17,680	10,048	24,677	24,147	16,599	14,628	17,680	7,335
Partial Retention	3,992	1,272	764	1,272	--	509	3,583	3,992	764	1,738
Modification	1,950	827	1,336	827	445	445	1,781	1,950	1,336	2,523
Maximum Modification	4,622	12,975	5,342	12,975	--	21	3,159	4,622	5,342	13,526
Total Acres	25,122	25,122	25,122	25,122	25,122	25,122	25,122	25,122	25,122	25,122

Preservation indicates that only natural ecological changes will occur.

Retention indicates an essentially natural appearing landscape will be present.

Partial Retention indicates the landscape will be slightly altered.

Modification indicates a moderately altered landscape will be present.

Maximum Modification indicates a heavily altered landscape may be present.

5. Wildlife

Alternatives A/NFMA and H would road 75 percent and allow for timber harvest emphasis on 18 percent of the area. This would result in approximately one-half the impact of Alternatives B, D and J which would road over 90 percent and harvest over 66 percent of the area. Alternatives C and I would road 74 percent of the area; this would result in a similar effect on wildlife habitat as Alternatives A and H. Alternatives E and F would have minimal effect on wildlife. Alternative G would have an effect on wildlife habitat that would be less than A and D but considerably more than E and F.

6. Fisheries

a. Significant Effects

In Alternatives E and F, essentially all of the area would remain roadless, while in Alternatives B, D and J most all of the area would be available for timber management. In the other alternatives, the stream areas would be managed in a variety of different ways. Table (A) depicts these management prescriptions for the stream areas shown.

Roading these areas could change the recreational fishing opportunities. Since about two-thirds of the Forest's fishing occurs in roaded areas, it is expected that fishing would increase. This would help to meet a portion of the fishing demand, but also could result in overfishing and reduction in both numbers and size of fish using the habitat. However, since the wild fisheries production is thought to be very low in many of these headwater-type stream systems, fishermen are unlikely to fish intensively in most areas and overfishing effects generally should not occur. It is also possible that if these areas remain roadless, access still would be readily available through the intermingled owner's lands.

Roading the unroaded areas could also result in environmental degradation to streams due to timber harvest and road construction in the basins. Some of these possible effects are addressed in the soil and water environmental effects section. Overall, even if all areas were roaded, it is not expected that there would be any significant effect on the resident fish populations.

b. Mitigation Measures

In the alternatives that could road presently unroaded areas, the riparian protection zone prescription, the Wenatchee National Forest’s Best Management Practices (September 1980 and revised October 1982), and all standards and guidelines common throughout riparian areas of the Forest would be applied in stream zones. This treatment should adequately protect the streams from a reduction in fish habitat capability.

If the areas are roaded, road closures could be implemented to reduce the impact of enhanced access on the native fish populations.

TABLE (A). Allocation of management prescriptions in the Taneum roadless area in lake and stream areas for Alternatives A/NFMA, C (Preferred), G, H and I. Where “Int.” is shown, this indicates that an intensive timber management strategy could dominate in that area. Where “Ext.” is shown, this indicates that an extended shelterwood timber management prescription would dominate in that area and would be executed primarily to meet visual objectives. Where “Rdls.” is shown, this indicates that the management prescription would be to maintain the area as roadless.

Stream/Lake	Alternative		
	A/H	C/I	G
Taneum Lake	All Rdls.	All Rdls.	All Rdls.
South Fk. Taneum	All Ext.	All Ext.	All Ext
Frost/Case Knife	All Int.	All Int.	All Int.
Blowout Creek	All Ext.	Half Ext. Half Int.	All Ext.

7a. Vegetation: Trees

Tree management through timber sales would be emphasized on 4,622 acres, or 18 percent, of the Taneum roadless area under Alternatives A/NFMA and H. This would increase to 12,975 acres, or 52 percent, under Alternatives B and D and 13,526 acres, or 54 percent under Alternative J.

Alternative E would not schedule any timber harvest. Alternative F is similar, but 5 percent of the area would be scheduled for other resource emphasis timber sales.

Alternatives C and I would propose 5,342 acres, or 21 percent, under timber emphasis prescriptions, and 7,037 acres, or 28 percent, as unroaded recreation. The remaining acres would be planned for other resource benefits including scenic travel routes.

Alternative G increases the unroaded motorized area to 8,649 acres, or 34 percent.

7b. Vegetation: Forage

This roadless area contains portions of one or more livestock allotments. (See the Livestock writeup under General Information for this area.) With the proposed vegetation manipulation in some alternatives, adequate forage will be produced for big game and livestock. This will offset the loss of forage due to natural succession and the exclusion of fire. Alternatives C, H, and I will contribute adequate forage. Forage in excess of expected needs will be produced in Alternatives A/NFMA, B, D and J. Needs for forage in the fourth and fifth decades will not be met for livestock in Alternatives E, F, and G.

8. Soil and Water

a. Significant Effects

The environmental consequences of allocating the Taneum area to General Forest or Roadless Management are discussed by alternative below. No significant soil and water consequences are associated with Alternatives E and F because soil and water disturbing activities occurring would be minimal. Alternatives A/NFMA, B, C, D, G, H, I, and J could allocate up to 94 percent of the area to timber harvest and road building. In Alternatives B, D and J, 49 percent of the area allocated to timber harvest could also be allocated to domestic livestock grazing. The environmental effects of timber harvest, road building, and livestock grazing on soil and water are discussed in Chapter IV - Soil and Water sections.

The risk of degrading the soil and water resource increases with more timber harvest and road building activity. Alternatives A/NFMA, B, C, D, G, H, I, and J pose more risk of degrading the soil and water resource than Alternatives E and F due to more intensive management. However, since Wenatchee National Forest Best Management Practices (1982) and Forest Plan Standards and Guidelines will be employed, no unique soil and water effects are expected to occur because of forest management in this area.

b. Mitigation Measures

The mitigation measures that will be used in this area are the same as those discussed in Chapter IV - Soil and Water sections.

c. Potential Conflicts with Plans and Policies of Other Jurisdictions

There are currently 18,635 acres of Burlington Northern Railroad lands within the area. More timber harvest has occurred on private land in the headwaters of North and South Rock Taneum Creeks, Little Creek, and Big Creek drainages than is occurring on National Forest lands. The Forest Service needs to examine land management practices on adjacent lands to consider the possibility of cumulative effects. The analysis of cumulative effects in this area is the same as that discussed in Chapter IV-Soil and Water sections.

9. Air

The additional prescribed burning generated in the Taneum roadless area as a result of the alternatives would not have a significant effect on air quality beyond the impacts discussed in Chapter IV.

10. Minerals

Since this area appears to have a low potential for the occurrence of mineral resources, the consequences on mineral resources do not appear to be extremely significant nor do they appear to vary appreciably by alternative. However, the management prescriptions under which the area would be managed in each alternative would restrict mineral activities to varying degrees (i.e., special stipulations in leases and in approved operating plans). The effects of these restrictions cannot be quantified, but the negative influence they would have on interest in conducting exploration activities within the area does vary by alternative and will, therefore, affect the potential for discovering and/or developing any unknown mineral resources of the area. This relative variation between alternatives is depicted on the following table.

Consequences on Mineral Resources

Restrictive Nature of Management Prescriptions	Acres Restricted by Management Prescriptions									
	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
Withdrawn from Mineral Entry (valid existing rights will be determined and recognized)	0	0	0	0	0	0	0	0	0	0
Highly Restrictive	13,397	10,090	14,373	10,090	24,613	23,978	16,048	13,397	14,373	8,120
Moderately Restrictive	7,103	1,230	5,407	1,230	509	1,123	5,915	7,103	5,407	2,649
Relatively Few Restrictions	4,622	13,802	5,342	13,802	0	21	3,159	4,622	5,342	14,353

11. Roads

The miles of local roads shown below for each alternative are those that are expected to be constructed to permit timber harvest. They are included in the totals for the various alternatives shown in Chapter IV of the FEIS. It is assumed that the bulk of these roads will be constructed within the next 20 years. An analysis of the road development in unroaded areas during the past ten years indicates that for every acre harvested approximately 5.5 acres are accessed. It is assumed that 50 percent of these roads will be closed to public traffic, and that the remainder will be suitable for travel by high clearance vehicles only.

These mileages are estimates based upon typical road densities necessary to harvest timber on different slope classes. The actual road miles that will result from the implementation of the various alternatives will be determined during project planning, design, and environmental analysis. The assumptions made for this analysis will be monitored. The construction of any road will be subject to the appropriate environmental analysis. That analysis will address the effects on resources that are dependent upon a roadless setting, including any adjacent roadless area or wilderness. The decision to close any road will be made on a case by case basis, according to the Forest Road Closure Policy found in the Forest-wide Standards and Guidelines.

	<u>Alternative</u>									
	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
Miles	56	48	44	48	0	3	38	56	44	48

12. Fire

The fire management workload generated in the Taneum roadless area as a result of the alternatives will not have a significant effect beyond the effects already described in Chapter IV.

A slight increase in risk of recreation related fires would occur in Alternatives E and F. Additional road access due to increased timber harvest activity would also increase risk of fire in Alternatives A/NFMA, B, C, D, H, I, and J. The cost efficiency of fire suppression activities would be slightly increased in Alternatives A/NFMA, B, C, D, H, I, and J as road access would allow more area to be covered by ground based suppression resources. Cost efficiency levels in Alternatives E and F would be less due to slower initial attack by ground forces or the use of more expensive aerial delivered resources such as helitack or smokejumpers.

The impacts generated by slash disposal activities are discussed in Chapter IV.

13. Social/Economic

To measure this area in terms of its social value, a basic assumption is being made. This is, because of the expressed interest in keeping as much of the inventoried roadless areas as possible in an unroaded condition, the more that condition is reflected, the higher the social value.

This condition is reflected for each alternative in the summary chart under item 1, Recreation, at the beginning of this section (Section V), which indicates the acres of unroaded management.

Also, as there is varying opinion as to the mode of transportation allowed, individuals must judge for themselves which alternative best meets that aspect of the social setting. There is also a summary table reflecting this condition for each alternative as referenced above which indicates the amount of motorized versus non-motorized use within the unroaded allocation.

A general measure of timber oriented economic impacts can be made using the same table referenced above showing the amount of unroaded allocation. The larger the unroaded area, the greater the impact on timber oriented jobs. If all of the estimated long-term sustained yield per year for this area were available, it would support 73.9 jobs.

14. Wilderness Potential

This roadless area is in checkerboard land ownership and has extremely limited opportunities for Wilderness designation. The private land has extensive road systems and timber harvest units and has no Wilderness characteristics. Alternatives B, D, and J allocate for this roadless area about 52 percent of the area to General Forest. Alternatives A, C, H, and I allocate a more balanced allocation between all resource values with C and I allocating 5,342 acres to General Forest. Alternatives E and F retain the more natural conditions with 100 percent and 95 percent of the area in unroaded allocations.

MANASTASH ROADLESS AREA

Size: Gross Acres: 15,794

Net Acres: 8,798

I. GENERAL INFORMATION

A. History

The area did not qualify as roadless under RARE II due to the large amount of mixed ownership in the area. It is being addressed due to public interest expressed as to the area remaining unroaded.

B. Location and Access

This area is within Kittitas County and lies on both the Cle Elum and Naches Ranger Districts and is adjacent to the Taneum and Quartz Mountain roadless areas. Main access is via the Quartz Mountain Road.

D. Physiography and Soils

Part of this area is composed of a high gently rolling basalt plateau that has cliffs and talus slopes along its outer perimeter. This feature generally occurs in the southern part of this unit. The remainder of the area is composed of an undulating topography of clayey and rocky soils. Sag ponds are common, and the drainage patterns in this portion of the area are not well developed.

Elevations range from 3,800 to 6,300 feet. There are several different soil types in this area, so management may be complicated by the pattern and arrangement of the different soils. Forty-eight percent of the soils have developed in basaltic materials; 21 percent from pyroclastic materials; 17 percent from alluvium; and the remaining 13 percent from granitic materials. The basaltic materials and the pyroclastic materials tend to be slippery and sticky when wet, but are fine for trails and other recreational uses when dry. The alluvium and the granitic soils on the other hand are not slippery or sticky when wet, and are fine for most uses, including trails, even when wet.

E. Vegetation

This area is 40 percent tentatively suitable forest land. Upper elevation species including lodgepole pine, subalpine fir and Englemann spruce are the most common species. Douglas-fir and western larch occur on the lower elevation warmer areas.

Volcanic scree rock areas and meadows are intermingled with the forested areas.

F. Current Uses

The current use is for dispersed recreation. The major activities and their estimated annual use are as follows:

<u>Activity</u>	<u>Estimated Annual Recreation Visitor Days</u>
Motorized Trail and 4x4 Use	1,000
Hunting	<u>2,500</u>
Total	3,500

The area contains the following Recreation Opportunity Spectrum (ROS) class:

<u>ROS Class</u>	<u>Acres</u>
Semi-primitive Motorized (SPM)	8,798

There are 17.8 miles of trail within the area of which all are open to motorized use. The area is also popular with 4x4 vehicle enthusiasts. The large amount of mixed ownership can cause problems in managing and maintaining the trail system in the area.

G. Appearance and Surroundings

The area has moderate visual variety in landforms, moderate to high variety in vegetation, rockforms, and waterforms (lakes and streams). High visual variety within the area occurs at Shoestring Lake basin, Basalt rock-formation, and Manastash Lake and Meadows.

The area contains a moderate to steep, highly textured landscape with broad ridgetops. One can find meadows, streams, and fall colors. The landscape is heavily vegetated.

The area is primarily viewed as foreground and middleground from the Quartz Mountain road, Manastash Ridge trail, and other trails. Middleground views are from Buck Meadows, and the South Fork of Manastash Creek and Bald Mountain. The area is viewed as background from viewpoints such as Little Bald.

The Manastash area is surrounded by the Quartz Mountain Road, Manastash Ridge, Bald Mountain and its upper ridgetops.

H. Attractions

There are no major scenic values. Basic physical features are Manastash Lake and the South Fork of Manastash Creek.

II. CAPABILITY-WILDERNESS CHARACTERISTICS

As the area lies within two Ranger Districts, the characteristics will be discussed by District.

A. Manageability and Boundaries

Cle Elum:

This area is bordered as follows: On the north by the Quartz Mountain Road; on the east by a series of roads, heavily cut over areas, and private land, and on the south and west by the divide between the Naches and Manastash drainages. The eastern boundary does not follow any geographic form and would be difficult to locate on the ground.

The roads bordering this area are either gravel surfaced or native material single lane facilities.

Naches:

The Manastash roadless area south of Manastash Ridge is bordered by Forest roads, timber harvest units and private land lines. With the exception of the survey boundaries, the meandering Forest roads and

harvest unit boundaries would be difficult to locate on the ground or map. Private timber company and Forest roads deeply penetrate this area. These roads bring the sights and sounds of human intrusion into the protruding fingers of land and the periphery of the roadless area.

B. Natural Integrity

Cle Elum:

This area is long and narrow, with good road access to most of the boundary. There is a 4x4 road the length of the area and several 4x4 roads cross it. These are heavily used by short wheel base, four-wheel-drive vehicles. There are five trails in the area that provide access to pedestrians, horse users, and motorcyclists.

There are no other physical impacts of people in the area.

Naches:

This roadless area was not considered for Wilderness or Roadless Area classification in RARE because of its large amount of checkerboard ownership. Private ownership in a roadless area would pose a significant administration problem if the landowner is not in agreement with management direction of the area. This area is bordered by both private and government roads and timber harvest units which reflect man's activities. Within the roadless area, past human activity has been relatively minor even though some of those activities have been extensive. The trail system provides access to Manastash Ridge at several points. This trail system has a long history of motorized vehicle use, both summer and winter. There are several four-wheel-drive routes in the roadless area that are heavily used.

C. Natural Appearance

Cle Elum:

The area itself is natural appearing. As the area is narrow and has several vantage points, management activities outside the area are easily seen.

Trails and 4x4 roads are the only unnatural appearing items in this area. There are 13 miles of trail and 14 miles of 4x4 road.

Naches:

The Manastash roadless area is so exposed on the south side of Manastash Ridge that views from the roadless area include forest roads, timber harvest activities, fire lookouts, and microwave sites. It is difficult to get a feeling that this is a natural area away from human activity and development. Parts of this roadless area has some interesting rock formations and open ridges for viewing scenery, but the continuously closed canopy is somewhat monotonous.

D. Opportunities for Solitude

Cle Elum:

Due to the size and configuration of this area, the opportunity for solitude is limited. Nowhere in the area could a person be more than a half mile from a trail, 4x4 road, or road. There would be more opportunity for solitude during the winter months, although portions of the area are used by snowmobiles.

Naches:

The area south of Manastash Ridge offers few opportunities for solitude. The area is a very irregular shaped with slim fingers of land protruding out into the developed areas. The area is approximately six miles long and four miles wide at the widest point. Rock Creek, Milk Creek, and North Fork Wenas Creek are the principal drainages of the area. The area contains open rolling ridges with large openings and slightly dissected topography with a fairly even cover of vegetation which allows some screening from other people at short distances in the timbered areas. The open rolling ridgetops poorly screen people from points in the distance.

E. Opportunities for Primitive Recreation

Cle Elum:

The opportunities for primitive recreation are low with the exception of hunting and winter sports. During the snow season the area is inaccessible except for over-the-snow vehicles and on foot. Most of the area is used by snowmobilers but is generally too far from plowed roads to get use by pedestrians.

Naches:

This area has been heavily used by motorized vehicle users in summer and winter for many years. However, it has modest opportunities for primitive recreation. The size of the area and the absence of facilities contribute to the primitive character of the area. The area is served by high quality Forest roads on the perimeter and good trail system within; however, there are opportunities for big game hunting (elk, deer, and black bear), horseback riding, hiking, and some pack-in camping if desired, and scenic viewing from the many open ridges.

F. Challenging Experiences

Cle Elum:

The geography of this area does not lend itself to challenge during the summer months. There are no peaks, cliffs or major waterways. During the snow season there are opportunities to challenge the cross-country skier, snowshoer and snowmobilers. Depth of snow in the area varies from 4 feet to 10 feet and the nearest plowed access is 10 miles distant.

Naches:

The area offers few challenging experiences to the seasoned visitor and only a slight challenge to the inexperienced.

A 50 mile non-wilderness hike has been jointly proposed through this area by the Boy Scouts Council (Yakima) and the U.S.F.S. Such a hike is not possible for large groups within wilderness due to party size limitations. Continuous 50 mile non-wilderness hikes are extremely rare and such a trail is needed to satisfy the needs of large groups. While motorized users frequent this corridor, they seldom overnight here. A variety of high quality primitive experiences are still available in this area.

G. Special Wildlife Features

There are no known threatened or endangered species in this area. The extent of use in the area by sensitive species is unknown.

H. Historical and Scientific Study

There are opportunities for outdoor education, scientific and historic study in the area from an archeological standpoint.

III. RESOURCES AND POTENTIALS

A. Recreation

The area has potential value for unroaded types of recreation activities. Estimated carrying capacity by ROS class is as follows:

<u>ROS Class</u>	<u>Capacity in Potential Recreation Visitor Days Per Year</u>
SPM	26,000

B. Wildlife

The area provides summer range for a few elk and habitat for a variety of other forest animals and birds including deer, black bear, and grouse.

C. Fish

There are three lakes in this area: Lost, Manastash and Shoestring Lakes. Lost and Manastash are planted regularly--Lost Lake with at least cutthroat trout and Manastash with rainbow and Eastern brook trout. Both Lost and Manastash Lakes are located on intermingled ownership lands. Shoestring Lake probably supports cutthroat trout.

Lost Creek (below Lost and Manastash Lakes) supports rainbow, cutthroat and Eastern brook trout, a large part of which move downstream from the lakes.

Manastash Creek has been stocked in the roaded area. These rainbow and cutthroat probably migrate into the roadless reaches. Downstream of the Forest boundary, Manastash Creek is sometimes entirely dewatered due to irrigation withdrawals.

D. Water

There are no water related encumbrances or planned activities within the area.

E. Livestock

This roadless area is currently within two existing domestic stock allotments. The portion of the area on the Cle Elum Ranger District is in the Manastash Unit of the Manastash Cattle Allotment. The portion south of Manastash Ridge on the Naches Ranger District is in the Naches Sheep Allotment. There is no potential for a Recreation Stock Allotment.

F. Timber

The area contains 3,519 acres of tentatively suitable forest land. Stand, volume, and other data area as follows:

Ecotype	Stand Size	Acres	Estimated Standing	
			Volume (MMBF)	(MMCF)
Wet	Mature	1,781	50.5	9.3
Wet	Immature	1,611	29.0	5.3
Wet	Seedling-Sapling	106	---	---
Dry	Immature	21	.1	
	Total	3,519	79.6	14.6

The estimated maximum biological potential contribution to the long-term sustained yield is 1.1 MM Bd. Ft. (0.2 MM Cu. Ft.) per year. Timber sale programs for the private lands are not known, however harvesting of timber is one of the major objectives of the owner.

G. Minerals

This area is primarily underlain by Miocene volcanic rocks. The area has not been investigated by the U.S.G.S. or U.S. Bureau of Mines, but available references indicates that it contains no known mineral resource occurrences of interest. The northern part of the area is classified "prospectively valuable" for coal, while the southernmost third is classified "prospectively valuable" for oil and gas. Even though there are no known petroleum resources in the area, there are four existing oil and gas leases which have yet to be explored. According to BLM mining claim recordation data (1/23/85), eight mining claims were located in the area all of which are considered abandoned for lack of annual assessment work.

H. Cultural-Historical

The Manastash area exhibits a continuation of the same prehistoric use patterns that are present in the Taneum area. There have been large number of archaeological sites identified within the boundaries of this area and the likelihood that others exist is very high. Historic uses have not been adequately researched, although the area does include sheep allotments dating back at least 60 years.

I. Land Use

There are no special land uses within the area.

J. Fire

Annual fire occurrence is low to moderate, generally ignited by natural causes. Fuel loadings are often heavy but broken by small meadows and openings. Fire history is low in this area.

K. Insects and Disease

Extensive stands of lodgepole pine near Manastash Lake are becoming high risk areas for a mountain pine beetle epidemic.

L. Private Lands

There are 6,996 acres of private lands within the area belonging to the Burlington Northern Railroad Company. Exchange possibilities are considered to be fair.

IV. NEED

A. Nearby Wilderness and Other Roadless Areas

This area is located within a few miles of the Alpine Lakes (393,360 acres), Norse Peak (50,923 acres), William O. Douglas (167,195 acres), and Goat Rocks (105,633 acres) Wilderness areas and adjacent to the Quartz and Taneum roadless areas.

B. Distance from Population Centers

The area is within two to four hours driving time from population centers such as Seattle-Tacoma, Yakima, Tri-Cities, and Wenatchee.

C. Need for Ecosystem Representation

There are no special or unique ecosystems within the area in need of representation through Wilderness classification.

D. Interest by Proponents, Including Congressional

There has been no expressed interest for additional Wilderness classification for this area by proponents or Congressional factions.

However, there have been proposals by both environmental and off-road vehicle users to maintain roadless status for the area.

E. Public Input

F. Other Public Involvement

Public input solicited during the formulation of alternatives for this plan indicated much support for dispersed, unroaded recreation use for the area. Opinions differ as to the area being motorized or non-motorized.

V. ENVIRONMENTAL CONSEQUENCES

A. Environmental Consequences Associated with the Alternatives

1. Recreation

a. Significant Effects

The Manastash roadless area consists of 8,798 acres and is located within Kittitas County adjacent to the Taneum and Quartz Mountain roadless areas. Approximately 40 percent of the area is inventoried as suitable for timber harvest. The roadless area has been inventoried according to the Recreation Opportunity Spectrum (ROS). The inventory shows the area is capable of Non-motorized Dispersed Recreation and/or Motorized Dispersed Recreation. Due to the mixed ownership pattern, roadless recreation management opportunities are severely limited. Approximately 45 percent of the area is inventoried as capable of providing Non-motorized Dispersed Recreation opportunities. Motorized Dispersed Recreation is potentially available on 40 to 70 percent of the area. Alternatives A/NFMA and H allocate approximately 45 percent of the area to motorized use. No acreage is allocated to Non-Motorized Dispersed Recreation. In Alternative E, the emphasis would be toward Motorized Dispersed Recreation in addition to a lesser amount of Non-motorized Dispersed Recreation. The emphasis would shift from the hunting experience to the challenge this terrain offers for motorized off-road use and to a lesser degree for hiking.

Alternatives B, C, D, F, G, and I allocate varying amounts of land to unroaded Motorized Dispersed Recreation with no allocation to non-motorized use. As the combination of timber harvest and wildlife management allocations increases, the motorized dispersed allocation decreases and vice versa. The character change brought about by increased harvest, therefore, reduces the dispersed recreation opportunities.

Alternative J allocated 62% of the area to General Forest with no allocation for unroaded recreation.

Due to the mixed ownership of this area, the current roadless condition can not be retained. Access to private lands will have a negative influence on the use of the area. Motorized dispersed recreation challenges will continue to exist, though the desirability is likely to decrease as the impact of timber harvest and road access to private lands becomes evident.

Under Alternatives C and I, the portion of the trail system in this roadless area is allocated as follows.

Trail Name	Trail Number	Unroaded Non-Motorized	Unroaded Motorized	Roaded Motorized
Hereford Meadows	1207	--	3.8	--
Manastash Lake	1350	--	4.4	--
Shoestring Lake	1385	--	--	3.6
Koenan Meadow	1386	--	--	3.1
Gold Creek	966	--	--	2.9
Totals		--	8.2	9.6

There is no obligation for the private landowners to protect existing trails or to construct new trails as their management activities impact the system.

b. Summary

The following tables indicate, by alternative, the degree to which this area will be allocated to roadless management and, of the roadless management acres, what percent is motorized and non-motorized. These represent the Semiprimitive Motorized and Semiprimitive Non-Motorized Recreation Opportunity Spectrum (ROS) Classes. The area being allocated to roaded types of management activities will become Roaded Natural or Roaded Modified ROS opportunities depending on the intensity of development.

Percent of the Area Having Unroaded Allocation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	46	40	69	40	100	69	54	46	69	0

Percent of the Unroaded Allocation Area
In Terms of Motorized/Non-Motorized Recreation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	100/0	100/0	100/0	100/0	69/31	100/0	100/0	100/0	100/0	0/0

The area being allocated to roaded management activities will have increased dispersed roaded recreation opportunities and the possible opening of access to potential developed recreation sites. The trail miles within the area allocated to roading may be reduced as road construction occurs. The roadless character of these portions would also be lost.

2. Wild, Scenic, and Recreational Rivers

There are none associated with this roadless area.

3. Cultural Resources

Consideration of cultural resource values are required by a special set of historic preservation laws, regulations and policies. Particular efforts will be made in every alternative to inventory, evaluate, and provide for significant cultural resources in areas where Forest management activities are planned.

4. Scenery

Alternatives A/NFMA and H will allocate the ridgetop areas to Retention and Partial Retention VQO. The Naches Ranger District side adjacent to Bald Mountain Areas will be allocated to Maximum Modification VQO.

Alternatives B, D and J will allocate over one-half of the area to Maximum Modification VQO. Heavily altered areas will be the lower end of the planning area below Manastash Ridge, on the Naches Ranger District side adjacent to Bald Mountain. Some areas will have high visual quality. The upper ridgetop of Manastash Ridge will be Retention VQO.

Alternatives C and I will allocate most areas to Retention VQO. The upper Manastash area and the middleground views from trails will have high visual quality. The Maximum Modification VQO allocation will be on the Naches Ranger District side adjacent to Bald Mountain.

Alternative E allocates all lands to Retention VQO. All areas will have a very high visual quality. Natural landscapes will dominate the landscapes.

Alternative F allocates most lands to Retention and a small area to Maximum Modification. Only the Naches Ranger District side adjacent to Bald Mountain will be allocated to Maximum Modification VQO.

Alternative G will allocate lands to Retention, Partial Retention, and Modification VQO. The Bald Mountain area will be General Forest. Some middleground area will also be heavily altered.

The following table summarizes the Scenic component of this area by alternative in acres of Visual Quality Objective (VQO).

VQO	A/NFMA	B	Alternative							
			C PREFERRED	D	E	F	G	H	I	J
Preservation	--	--	--	--	--	--	--	--	--	--
Retention	5,301	3,731	7,081	3,371	8,798	7,124	5,873	5,301	7,081	191
Partial Retention	466	466	212	466	--	275	381	466	212	1,102
Modification	1,102	1,972	--	1,972	--	--	1,124	1,102	--	2,014
Maximum Modification	1,929	2,629	1,505	2,629	--	1,399	1,420	1,929	1,505	5,491
Total Acres	8,798	8,798	8,798	8,798	8,798	8,798	8,798	8,798	8,798	8,798

Preservation indicates that only natural ecological changes will occur.

Retention indicates an essentially natural appearing landscape will be present.

Partial Retention indicates the landscape will be slightly altered.

Modification indicates a moderately altered landscape will be present.

Maximum Modification indicates a heavily altered landscape may be present.

5. Wildlife

Alternatives A/NFMA and H would road 54 percent and allow for harvest emphasis on 22 percent of the area. Alternatives B and D would road 60 percent and allow for harvest emphasis on 30 percent of the area. Alternatives A/NFMA and H would not have motorized recreation in the unroaded area, but B and D would allow the development of motorized recreation in 40 percent of the area. Alternative J would road 100 percent of the area with harvest emphasis on 62 percent of the area. Based on the amount of motorized recreation use, Alternatives A/NFMA and H would have less impact on wildlife than B, D and J. Alternatives C, F, G, and I would have less effect on wildlife than B, D and J but more than A/NFMA and H, based on the development of motorized recreation use in the area. Alternative E would have *minimal effect on wildlife when compared to the other alternatives*.

6. Fisheries

a. Significant Effects

In Alternatives E and F, all the areas with fish populations in this roadless area would remain roadless. Also, in all alternatives, Manastash and Shoestring Lakes would remain unroaded, as would all of the Manastash Creek area except the lower one-quarter mile. In the other alternatives, the stream and lake areas would be managed in a variety of different ways. Table (A), below, depicts these management prescriptions for the areas shown.

Roading these areas could change the recreational fishing opportunities. Since about two-thirds of the Forest's fishing occurs in roaded areas, it is expected that fishing would increase. This would help to meet a portion of the fishing demand, but also could result in overfishing and reduction in both numbers and size of fish using the habitat. However, since the wild fisheries production is thought to be very low in many of these headwater-type stream systems, fishermen are unlikely to fish intensively in most areas and overfishing effects generally should not occur. It is also possible that if these areas remain roadless, access still would be readily available through the intermingled owner's lands.

Roading the unroaded areas could also result in environmental degradation to streams due to timber harvest and road construction in the basins. Some of these possible effects are addressed in the soil and water environmental effects section. Overall, even if all areas would be roaded, it is not expected that there would be any significant effect on the resident fish populations.

b. Mitigation Measures

In the alternatives that could road presently unroaded areas, the riparian protection zone prescription, the Wenatchee National Forest's Best Management Practices (September 1980 and revised October 1982), and all standards and guidelines common throughout riparian areas of the Forest would be applied in stream zones. This treatment should adequately protect the streams from a reduction in fish habitat capability.

If the areas are roaded, road closures could be implemented to reduce the impact of enhanced access on the native fish populations.

TABLE (A) - Allocation of Management Prescriptions in the Manastash Roadless Area in Lake and Stream Areas for Alternatives A/NFMA, B, C (Preferred), D, G, H, and I.

Where "Int" is shown, this indicates that an intensive timber management strategy could dominate in that area. Where "Ext" is shown, this indicates that an extended shelterwood timber management prescription would dominate in that area and would be executed primarily to meet visual objectives. Where "Rdls" is shown, this indicates that the management prescription would be to maintain the area as roadless. Where "Big Game" is shown, this indicates that the management prescription would be to maximally produce appropriate forage for big game. And where "Range" is shown, this indicates that the principal management prescription would be to benefit domestic livestock.

Stream/Lake	Alternative			
	A/H	B/D	C/I	G
Lost Lake Rdls.	All Rdls	All Range	All Rdls	All
Lost Creek Int	All Int.	All Range	All Int.	All
Manastash Creek Game lower 1/4 mile	Big Game	Range	Ext.	Big

7a. Vegetation: Trees

Tree management would be planned on 4,239 acres, or 48 percent of the area under Alternatives A/NFMA and H. Total vegetation manipulation area would be about the same under Alternatives B and D. However, under these alternatives the emphasis would be on timber production rather than other resource enhancement and protection. Alternative J would allow tree management on 87 percent of the area and would also emphasize timber production.

No timber management would be scheduled under Alternative E, and only 2,438 acres, or 28 percent, under Alternative F. Alternative G is similar to F but with slightly more harvest expected.

Alternatives C and I would manage 1,505 acres with emphasis on timber production (17 percent). In addition, 954 acres will be managed for other resource values that permit scheduled timber harvest.

7b. Vegetation: Forage

This roadless area contains portions of one or more livestock allotments. (See the Livestock writeup under General Information for this area.) With the proposed vegetation manipulation in some alternatives, adequate forage will be produced for big game and livestock. This will offset the loss of forage due to natural succession and the exclusion of fire. Alternatives C, H, and I will contribute adequate forage. Forage in excess of expected needs will be produced in Alternatives A/NFMA, B, D and J. Needs for forage in the fourth and fifth decades will not be met for livestock in Alternatives E, F, and G.

8. Soil and Water

a. Significant Effects

The environmental consequences of allocating the Manastash area to General Forest or Roadless Management are discussed by alternative below. No significant soil and water consequences are associated with Alternative E because soil and water disturbing activities occurring would be minimal. Alternatives A/NFMA, B, C, D, F, G, H, and I could allocate up to 60 percent of the area to timber harvest and road building. Alternative J allocates 100 percent. In Alternatives B and D, 20 percent of the area allocated to vegetation management could also be allocated to domestic livestock grazing. The environmental effects of timber harvest, road building, and livestock grazing on soil and water are discussed in Chapter IV - Soil and Water sections.

The risk of degrading the soil and water resource increases with more timber harvest and road building activity. Alternatives A/NFMA, B, C, D, G, H, I and J pose more risk of degrading the soil and water resource than Alternative E due to more intensive management. However, since Wenatchee National Forest Best Management Practices (1982) and Forest Plan Standards and Guidelines will be employed, no unique soil and water effects are anticipated because of forest management in this area.

b. Mitigation Measures

The mitigation measures that will be used in this area are the same as those discussed in Chapter IV - Soil and Water sections.

9. Air

The additional prescribed burning generated in the Manastash roadless area as a result of the alternatives would not have a significant effect on air quality beyond the impacts discussed in Chapter IV.

10. Minerals

Since this area appears to have a low potential for the occurrence of mineral resources, the consequences on mineral resources do not appear to be extremely significant nor do they appear to vary appreciably by alternative. However, the management prescriptions under which the area would be managed in each alternative would restrict mineral activities to varying degrees (i.e., special stipulations in leases and in approved operating plans). The effects of these restrictions cannot be quantified, but the negative influence they would have on interest in conducting exploration activities within the area does vary by alternative and will, therefore, affect the potential for discovering and/or developing any unknown mineral resources of the area. This relative variation between alternatives is depicted on the following table.

Consequences on Mineral Resources

Restrictive Nature of Management Prescriptions	Acres Restricted by Management Prescriptions									
	A/NFMA	B	C PREFERRED	Alternative D	E	F	G	H	I	J
Withdrawn from Mineral Entry (valid existing rights will be determined and recognized)	0	0	0	0	0	0	0	0	0	0
Highly Restrictive	4,559	3,985	6,339	3,985	8,798	6,360	5,152	4,559	6,339	1,123
Moderately Restrictive	2,310	212	994	212	0	1,039	2,226	2,310	954	170
Relatively Few Restrictions	1,929	4,601	1,505	4,601	0	1,399	1,420	1,929	1,505	7,505

11. Roads

The miles of local roads shown below for each alternative are those that are expected to be constructed to permit timber harvest. They are included in the totals for the various alternatives shown in Chapter IV of the FEIS. It is assumed that the bulk of these roads will be constructed within the next 20 years. An analysis of the road development in unroaded areas during the past ten years indicates that for every acre harvested approximately 5.5 acres are accessed. It is assumed that 50 percent of these roads will be closed to public traffic, and that the remainder will be suitable for travel by high clearance vehicles only.

These mileages are estimates based upon typical road densities necessary to harvest timber on different slope classes. The actual road miles that will result from the implementation of the various alternatives will be determined during project planning, design, and environmental analysis. The assumptions made for this analysis will be monitored. The construction of any road will be subject to the appropriate environmental analysis. That analysis will address the effects on resources that are dependent upon a roadless setting, including any adjacent roadless area or Wilderness. The decision to close any road will be made on a case-by-case basis, according to the Forest Road Closure Policy found in the Forest-wide Standards and Guidelines.

	<u>Alternative</u>									
	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
Miles	10	6	6	6	0	4	6	10	6	10

12. Fire

The fire management workload generated in the Manastash roadless area as a result of the alternatives will not have a significant effect beyond the effects already described in Chapter IV.

A slight increase in risk of recreation related fires would occur in Alternatives E and F. Additional road access due to increased timber harvest activity would also increase risk of fire in Alternatives A/NFMA, B, C, D, G, H, I and J. The cost efficiency of fire suppression activities would be slightly increased in Alternatives A/NFMA, B, C, D, G, H, I, and J as road access would allow more area to be covered by ground based suppression resources. Cost efficiency levels in Alternatives E and F would be less due to slower initial attack by ground forces or the use of more expensive aerial delivered resources such as helitack or smokejumpers.

The impacts generated by slash disposal activities are discussed in Chapter IV.

13. Social/Economic

To measure this area in terms of its social value, a basic assumption is being made. That is, because of the expressed interest in keeping as much of the inventoried roadless areas as possible in an unroaded condition, the more that condition is reflected, the higher the social value.

This condition is reflected for each alternative in the summary chart under item 1, Recreation, at the beginning of this section (Section V), which indicates the acres of unroaded management.

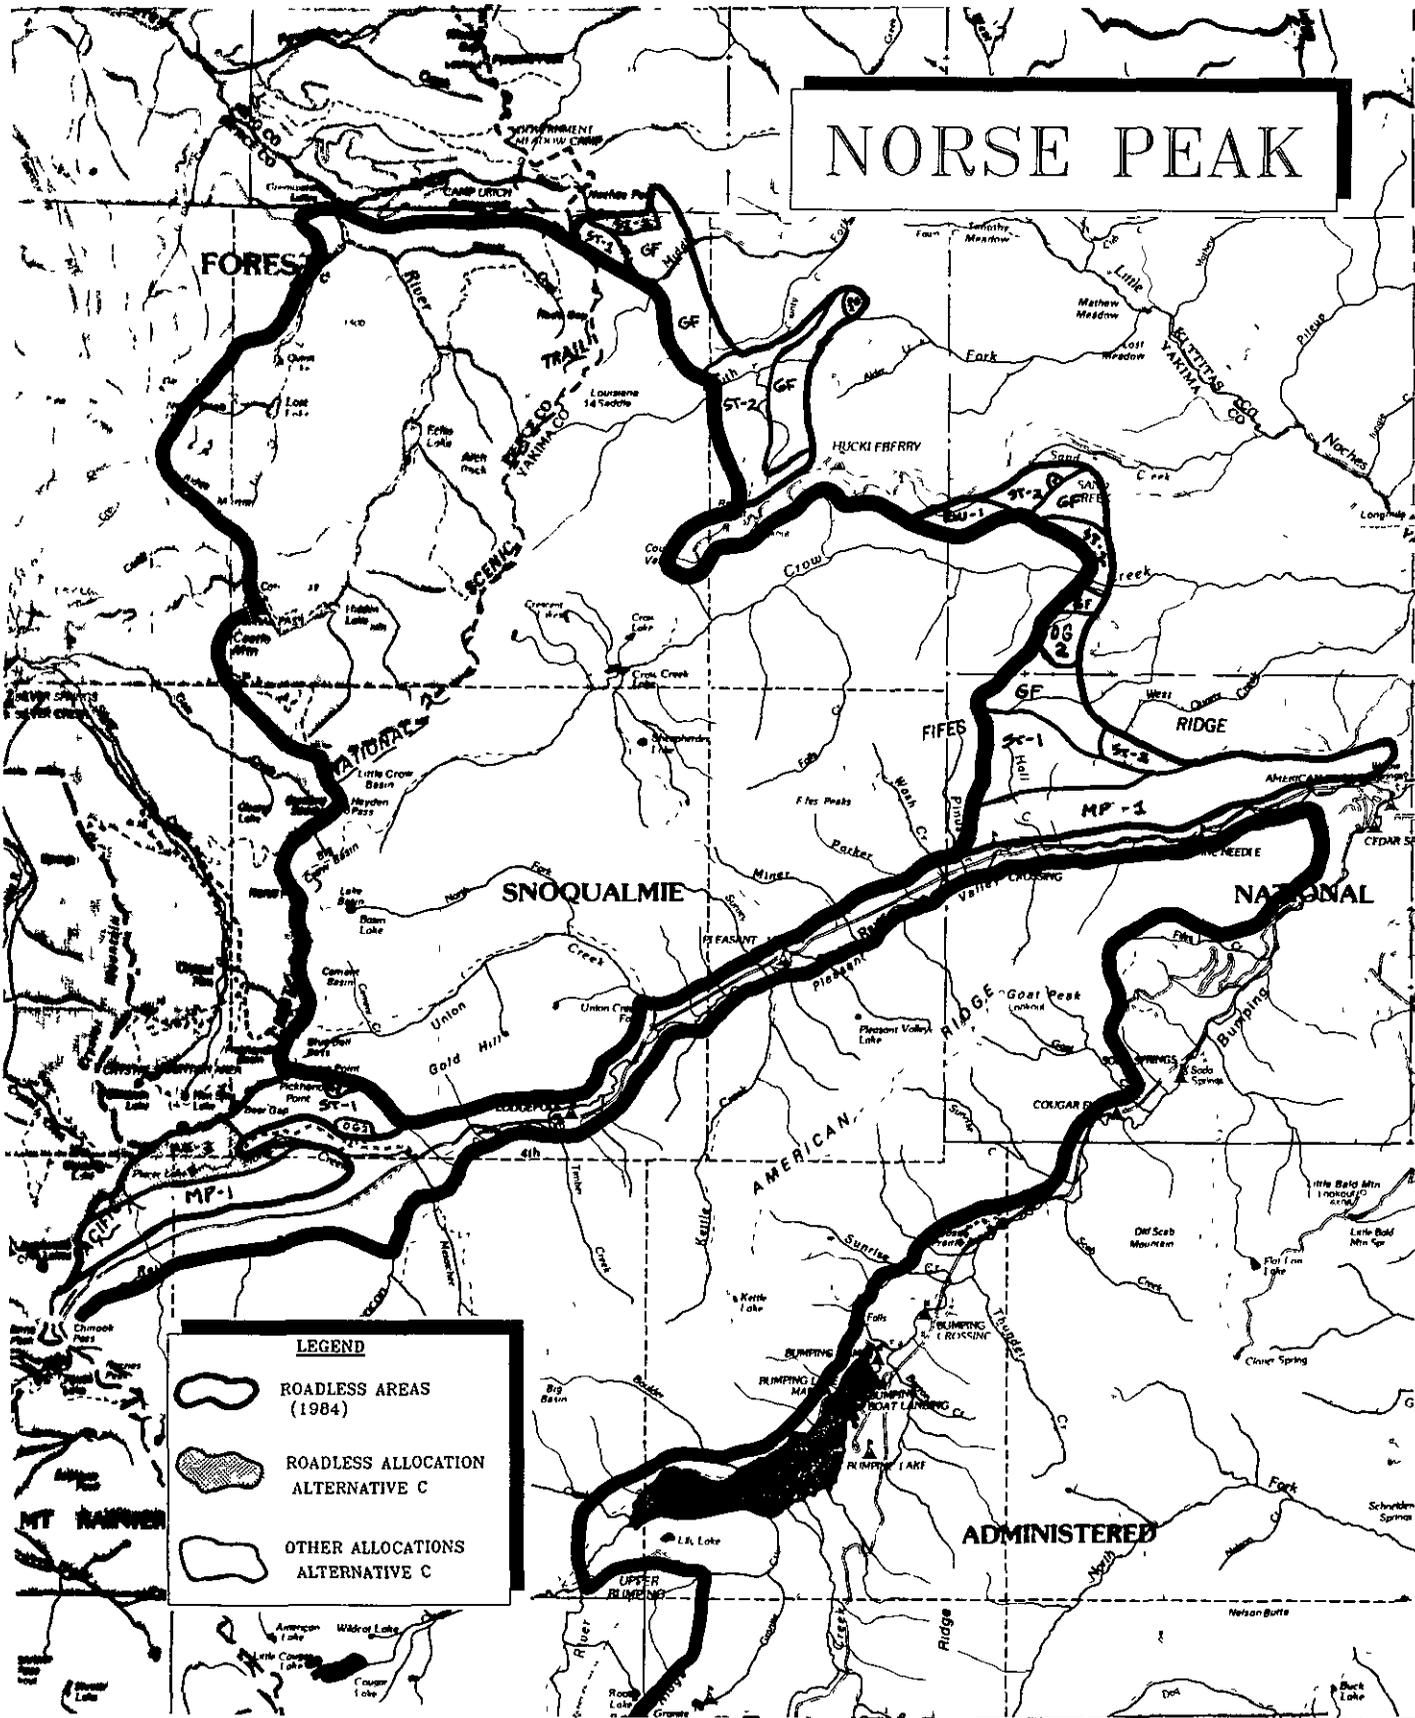

Also, as there is varying opinion as to the mode of transportation allowed, individuals must judge for themselves which alternative best meets that aspect of the social setting. There is also a summary table reflecting this condition for each alternative as referenced above which indicates the amount of motorized versus non-motorized use within the unroaded allocation.

A general measure of timber oriented economic impacts can be made using the same table referenced above showing the amount of unroaded allocation. The larger the unroaded area, the greater the impact on timber oriented jobs. If all of the estimated long-term sustained yield per year for this area were available, it would support 13.4 jobs.

14. Wilderness Potential

This roadless area has very limited potential for Wilderness due to its location, size, and checkerboard land ownership pattern with private land. There is not a great difference in the allocations by alternative for this area. Alternative E allocates the entire area to unroaded. Alternatives B, D, and J, the most acreage to General Forest. There is little difference between Alternatives A/NFMA, C, F, G, H, and I.

NORSE PEAK

NORSE PEAK ADJACENT ROADLESS AREA

Size: Gross Acres: 11,470

Net Acres: 11,300

I. GENERAL INFORMATION

A. History

The area was inventoried and analyzed under RARE II and was recommended as non-Wilderness. It was re-examined under the analysis for the Washington State Wilderness Act Analysis of 1984 and 35,892 acres were made Wilderness.

B. Location and Access

The area is immediately adjacent to the east boundary of the newly created Norse Peak Wilderness within Yakima County on the Naches Ranger District. Access is via Highway 410 and the Little Naches and Raven's Roost roads.

C. Physiography and Soils

This unit occurs in three separate and very distinct parts, each having its own physiographic character. The portion near Chinook Pass has an open, semi-rounded character with lots of convex slopes. The timber grows in a rather open scattered pattern. The part by Naches Pass has a large open meadow area near the crest, with the rest of the unit composed of rather uniform slopes covered by dense stands of conifers. The third area is also characterized by uniform slopes covered by dense stands of conifers.

Elevations range from 3,300 to 5,100 feet. Most of the soils have developed in two kinds of parent materials, which are basaltic materials and pyroclastic materials. There are some soils that have formed in glacial till materials; however, they make up only about four percent of the area. The basaltic soils normally range from 20 to about 40 inches deep, and the pyroclastic soils tend to be a little deeper, normally ranging from about 36 to 60 inches deep. Both kinds of soil materials tend to be slippery or sticky when wet, and both are easily compacted when moist. The till soils, on the other hand, tend to be coarser textured and contain 15 to 55 percent coarse fragments (rocks). Also, although the glacial till may be many feet thick, the soils are generally only about two to three feet thick.

D. Climate

This particular roadless area is contained in a relatively narrow band but with a wide range of precipitation between 45 and 100 inches annually. There are no aerial marker or snow survey sites within this area, but its proximity to the high country indicates peak snow depths exceeding 200 inches, with yearly averages of approximately 120 inches throughout the area.

E. Vegetation

This area is 59 percent tentatively suitable timber area. Most of this (60 percent) is in mature, wet timber types.

Heavy volume Douglas-fir, spruce, hemlock, and western red cedar stands occur along the Chinook Pass Highway.

A small area of dry type occurs in the south slope east of Hall Creek. Here clumpy ponderosa pine, Douglas-fir and open rock areas are typical.

F. Current Uses

The current use is for dispersed recreation. The major activities and their estimated annual use are as follows:

<u>Activity</u>	<u>Estimated Annual Recreation Visitor Days</u>
Hunting	1,000
Motorized Trail Riding	<u>200</u>
Total	1,200

The area contains the following kinds and amounts of Recreation Opportunity Spectrum (ROS) Classes:

<u>ROS Class</u>	<u>Acres</u>
Semi-Primitive Non-Motorized (SPNM)	148
Semi-Primitive Motorized (SPM)	11,152

There are 14.4 miles of trail within the area of which all are currently open to motorized use.

G. Appearance and Surroundings

Visual variety in landforms, rockforms, vegetation, and waterforms (lakes and streams) is moderate.

The area has a broken, open vegetative pattern on the ridgeline. It has heavily textured vegetative patterns throughout, undulating slopes with moderate to steep hillsides. Textural patterns are dominant.

The area is primarily viewed as foreground from trails that lead into the Norse Peak Wilderness, and from the Mather Memorial Highway (Highway 410). Middleground views are from the Ravens Roost area and other Forest roads.

The Norse Peak area is surrounded by the Norse Peak Wilderness, Mather Memorial Highway, and the Quartz Creek, Crow Creek, North Fork, and Middle Fork of the Little Naches drainages.

H. Attractions

Main features are basalt cliffs and talus slopes. The Crow Creek, South Fork, and Naches Rivers are within the area.

II. CAPABILITY-WILDERNESS CHARACTERISTICS

A. Manageability and Boundaries

The Morse Creek segment borders Mt. Rainier National Park to the west, Norse Peak Wilderness to the northeast and parallels State Highway 410 to the south. The intrusion of the Morse Creek road in the heart of the area and numerous private patented mining claims would make managing this roadless area segment very difficult. The Hall Creek Basin is bordered by the classified Wilderness to the west, State Highway 410 to the south, and numerous forest roads and harvest units to the northeast. This segment could be easily managed as roadless if the boundary was set on top of Fife Ridge. The segment north of Raven Roost is bordered on the west by classified Wilderness and forest roads and timber harvest units on the remaining sides. If the motorized trail mentioned in the 1984 Wilderness Act is excluded, there would be little area left to manage. Finding a manageable east boundary around cutting units and Forest roads would be difficult. The segments bordering State Highway 410 are in the Mather Memorial Parkway and are managed for recreation and scenic values.

B. Natural Integrity

The Norse Peak roadless area outside of the classified Norse Peak Wilderness has a number of signs of past human activity. The three segments that make up the Norse Peak roadless area are accessed by trails with predominantly motorized vehicle use. The Morse Creek road protrudes about two miles into the vicinity of the roadless area leaving about a quarter mile depth at the narrowest point. The Morse Creek drainage has nine patented mining claims with road access to two of the claims. The remaining claims are in the roadless area with evidence of mining activity. There is also an earth dam remaining from mining days prior to 1900 which has a wooden spillway and steel piped outlet. An old mining cabin on an existing unpatented mining claim has been in continued use for many years and is accessed by a trail lying within the roadless area.

In the other two segments of the Norse Peak roadless area are two trails (Raven Roost Trail #945A and Sand Creek Trail #963) that were left out of the classified Wilderness because they were heavily used by motorized vehicles.

C. Natural Appearance

Although most of the roadless area is a physical extension of the classified Wilderness much of the roadless segments appear to be disturbed by man's activities. This is especially true of the Morse Creek drainage. The reverse is true of the Hall Creek Basin. This basin was part of the Fife Peak Backcountry Management Unit. This basin is large enough and the topography and vegetation are such that persons visiting the area feel they are in a natural area away from human activity and development. State Highway 410 can be seen from higher points within this area but few other signs of man's activities can be seen. The rugged cliffs of Fife's Ridge and alpine benches reinforce a feeling of naturalness. The segment north of Raven Roost is a closed canopy of evergreens bordered by timber harvest units and Forest roads.

D. Opportunities for Solitude

The Norse Peak roadless area offers a variety of opportunities for solitude. Most of the 11,300 acre roadless area is exposed to human activities. Morse Creek drainage is impacted heavily with early mining and present mining activities. Forest Road #176 penetrates about two miles into the drainage, greatly reducing the possibility of solitude. The other two segments, especially the Hall Creek drainage, provide a high opportunity for solitude. This deeply dissected topography and vegetative cover easily screens people from one another at short distances.

E. Opportunities for Primitive Recreation

Like the opportunities for solitude, the opportunities for primitive recreation are varied. The presence of facilities and mining activities in Morse Creek drainage reduce the more primitive recreation pursuits. Gold panning, berry picking, some big game hunting, hiking, and horseback riding take place in this drainage. The Hall Creek Basin, with isolation and relative diversity and the absence of facilities, contributes to the primitive character of the area. This basin provides ample opportunity for quality big game hunting of elk, deer, black bear, and mountain goat when permitted, hiking, backpack camping, and scenic viewing. The segment north of Raven Roost is limited to trail activities for the most part due to the closed canopy and dense vegetation. Some big game hunting for elk takes place in this segment.

F. Challenging Experiences

Most of the Norse Peak roadless area segments provide some challenge. The rugged cliffs and terrain of the Hall Creek drainage and the dense vegetation of the area north of Raven Roost provide the inexperienced with a challenge.

G. Special Wildlife Features

There have been sightings of peregrine falcon reported but no nesting sites have been located. No other threatened or endangered species have been located in this area. The extent of use in this area by sensitive species is unknown.

H. Historical and Scientific Study

There are no special or unique opportunities for outdoor education and scientific or historic study in the area which cannot already be found in the existing wilderness on the Forest.

III. RESOURCES AND POTENTIALS

A. Recreation

The area has potential value for unroaded types of recreation activities.

Estimated carrying capacity by ROS class is as follows:

ROS Class	Capacity in Potential Recreation Visitor Days Per Year
SPNM	200
SPM	<u>33,000</u>
Total	33,200

B. Wildlife

The area is elk summer range and also provides habitat for a variety of forest animals and birds, including black bear, deer, and grouse.

C. Fish

In the portions of Crow Creek and the South Fork of the Little Naches River included in this area, there are significant populations of wild cutthroat trout typical of the eastern Cascade crest area. These reaches of stream are very short within this area compared to their overall length.

Morse Creek in the vicinity of Chinook Pass has native bull trout and non-native Eastern brook trout. The populations are not significant in comparison to the main American River and some of its tributaries.

D. Water

There are no water related encumbrances or planned projects within the area.

E. Livestock

This roadless area is actually three small areas along the edge of the Norse Peak Wilderness. As part of a continuous larger roadless area within the Wilderness, they make up portions of the Little Naches and the Crow Creek recreation stock allotments. If combined with adjacent areas both inside and outside of the Wilderness, there is potential for a domestic stock allotment for sheep.

F. Timber

The area contains 6,699 acres of tentatively suitable forest land. Stand, volume, and other data are as follows:

Ecotype	Stand Size	Acres	Estimated Standing	
			Volume (MMBF)	(MMCF)
Wet	Mature	4,049	114.7	21.0
Wet	Immature	1,992	35.8	6.6
Wet	Seedling-Sapling	85	---	---
Dry	Mature	191	2.4	0.4
Dry	Immature	382	3.7	0.7
	Total	6,699	156.6	28.7

The estimated maximum biological potential contribution to the long term sustained yield is 2.2 MM Bd. Ft. (0.4 MM Cu. Ft.) per year.

G. Minerals

This area is primarily underlain by Tertiary-aged volcanic and granitic rocks. Adjacent lands have been studied by the U.S.G.S. and U.S. Bureau of Mines as part of their Cougar Lakes-Mount Aix Wilderness investigation. As a result of that investigation, no lands immediately adjacent to the subject area were identified as having a "probable" mineral resource potential. The southernmost portion of the area near Placer Lake and Gold Hill does, however, have reported occurrences of arsenic, copper, lode gold, placer gold, lead, molybdenum, silver, zinc, chromium, and iron. This area lies adjacent to the Silver Creek mining district, and geologically it appears to have a "moderate" potential for the occurrence of low-grade copper, molybdenum, gold, and tungsten deposits. The northern two parcels do not appear to share this potential. According to BLM mining claim recordation data (1/23/85), 244 lode claims and 12 placer claims have been located within or adjacent to the southernmost parcel, whereas only two placer claims are recorded for the northern parcels.

Except for geothermal resources, the area is not classified "prospectively valuable" for leasable minerals. Even though it is not classified "prospectively valuable" for oil and gas resources, there are two existing leases and four pending lease applications involving the subject areas. Not having been explored, there is no basis for projecting an oil and gas potential for the area.

H. Cultural-Historical

There are no formally inventoried cultural resource sites within the Norse Peak adjacent unit, but there are recorded lithic scatters near both the northern and southern boundaries, and there is at least a moderate potential for the occurrence of archaeological materials within this unit. In addition, a huckleberry collecting area of special significance to the Yakima Indians once existed in the general vicinity of Raven's Roost Lookout. Historically, a portion of the area falls within the former Summit Mining District. Remnants of early prospecting and mining activity, dating from the late 19th century, still exist.

I. Land Use

There are no special uses within the area.

J. Fire

Annual fire occurrence is low to moderate with lightning causing most fires. Fuel loadings range from heavy accumulations of down fuels at lower elevations to scattered clumps of trees and small meadows at higher elevations. Periodic large fires have occurred in this area.

K. Insects and Disease

Blackhead budworm damage was visible along the Chinook Pass Highway in 1984. Entomologists expect this defoliation will not be a serious, long-term, damaging agent in this area.

In general this area has a good mix of species and less than average insect and disease losses.

L. Private Lands

There are 170 acres of private land within the area. Acquisition possibilities are considered to be fair.

IV. NEED

A. Nearby Wilderness and Other Roadless Areas

This area is located immediately adjacent to the 50,923 acre Norse Peak Wilderness and within two to three miles north of the 167,195 acre William O. Douglas Wilderness Area.

B. Distance from Population Centers

The area is within two to four hours driving time from population centers such as Seattle-Tacoma, Yakima, Tri-Cities, and Wenatchee.

C. Need for Ecosystem Representation

There are no special or unique ecosystems within the area in need of representation through Wilderness classification.

D. Interest by Proponents, Including Congressional

The interest on segments of this roadless area has been mixed. The Morse Creek drainage has had interest by the private landowner to keep it non-Wilderness so he may develop the area into an alpine ski area. The area has been shown and inventoried as an expansion of the Crystal Mountain Ski Area for many years. The Crystal Mountain Ski Area borders the area on the northwest side. There has also been interest to leave the area open for mining. There are approximately 100 unpatented mining claims and 9 patented mining claims in the drainage with many more west of the Cascade Mountain Divide. These interests were taken into consideration when this segment was not included in the 1984 Wilderness Act.

The Hall Creek Basin was a candidate for Wilderness. It is in the Fife Peak Backcountry Management Unit or at least that portion south of Fife Ridge. This segment has had roadless area interest for local people and has had one appeal on a timber sale that was proposed on the edge of the area. The units that were controversial were left out of the timber sale.

The segment north of Raven Roost has had interest by local industry to keep it in General Forest classifications and available for timber harvest. There has been no other significant interest in this segment

E. Public Input

Of 7,296 responses under RARE II, 64 percent were for non-wilderness, 1 percent further planning, 13 percent for Wilderness with boundary adjustments, and 22 percent for Wilderness. A number of motor-bike users have shown considerable interest at public meetings to keep existing bike trails open to bikes

The private landowner, Ward Meeks, has made it clear he wished to develop his lands in conjunction with an alpine ski area. There has been some interest in keeping Hall Creek Basin from Fife Ridge south in some form of roadless classification.

F. Other Public Involvement

In addition to the Forest Plan public meetings, there have been timber sale plans adjacent to the roadless area that have had scoping with involvement from the Washington State Department of Game, interested public, and Forest Service permittees. Their input reflects similar views to those received in other public meetings on the roadless area. However, some timber sales were appealed because of the possible impact of specific units. These units were excluded from the sale where the concern was justified.

V. ENVIRONMENTAL CONSEQUENCES

A. Environmental Consequences Associated with the Alternatives

1. Recreation

a. Significant Effects

Any roading in the Norse Peak Adjacent roadless area will reduce Semi-primitive, Non-motorized Recreation opportunities for the future. Scenic Travel retention areas along Chinook Pass but outside the Norse Peak Adjacent roadless area, will not significantly impact the roadless area.

Alternatives E and F would best accommodate roadless, non-motorized, use of the Hall Creek drainage which was the managed use under the Fifes Peak Backcountry Management Plan prior to Wilderness classification.

Proposed developed alpine ski area plans on private land, and in conjunction with Crystal Mt. Ski Area (Mt. Baker-Snoqualmie N.F.), have lead to the Developed Recreation Management prescriptions for all but Alternative E, which recommends an almost total Dispersed Recreation, Non-motorized prescription. Alternatives B, C, D, I, and J recommend a balanced use of developed recreation (at around 1,950 acres).

Alternatives B, D and J allcated about 48% of the area to General Forest.

Alternative E recommends this area be managed predominantly (11,236 acres) for Dispersed Recreation, Non-motorized, with the balance of 64 acres managed for special area (Historic Trail - non-scenic) considerations.

Alternatives A/NFMA and H suggest a prescription of 2,650 acres of Dispersed Recreation, Unroaded, Non-motorized.

Alternatives C and I allocate 64 acres to a Special Area non-scenic prescription along the Naches Pass Historic Trail Corridor. Alternatives B and D do not allocate any Special Area designation at this location.

Alternative F allocates 1,272 acres to Dispersed Recreation, Unroaded, Non-motorized, and 1,908 acres to Developed Recreation.

Under Alternatives C and I, the portion of the trail system in this roadless area is allocated as follows:

Trail Name	Trail Number	Unroaded Non-Motorized	Unroaded Motorized	Roaded Motorized
M Fork Naches	945	--	--	3.0
Middle Fork	945.1	--	--	0.2
W. Quartz Creek	952	--	--	1.0
Fifes Ridge	954	--	--	3.3
Sand Creek	963	--	--	3.0
Bear Gap	967	--	--	0.9
Totals		--	--	11.4

b. Summary

The following tables indicate, by alternative, the degree to which this area will be allocated to roadless management and, of the roadless management acres, what percent is motorized and non-motorized. These represent the Semi-primitive Motorized and Semi-primitive Non-Motorized Recreation Opportunity Spectrum (ROS) Classes. The area being allocated to roaded types of management activities will become Roaded Natural or Roaded Modified ROS opportunities depending on the intensity of development.

Percent of the Area Having Unroaded Allocation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	23	0	13	0	100	11	35	23	13	0

Percent of the Unroaded Allocation Area
In Terms of Motorized/Non-Motorized Recreation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	0/100	0/0	4/96	0/0	0/100	5/95	98/2	0/100	4/960	0/0

The area being allocated to roaded management activities will have increased dispersed roaded recreation opportunities and the possible opening of access to potential developed recreation sites. The trail miles within the area allocated to roading may provide a less semi-primitive recreation experience with a more Roaded Natural or Roaded Modified setting.

2. Wild, Scenic, and Recreational Rivers

A portion of the following river corridor (one-quarter mile either side of the river) is being located within this roadless area and is recommended for designation in Alternatives C and I:

<u>River</u>	<u>Recommended Classification</u>
American River	Segment 2 Scenic

More information concerning this recommendation can be found in Chapter III and Chapter IV.

3. Cultural Resources

Consideration of cultural resource values are required by a special set of historic preservation laws, regulations and policies. Particular efforts will be made in every alternative to inventory, evaluate, and provide for significant cultural resources in areas where Forest management activities are planned.

4. Scenery

Alternatives A/NFMA and H will allocate most areas to Retention, and Partial Retention VQO. Some large areas will be allocated to Maximum Modification. County Creek and the trail in the area will be heavily altered. The Mather Memorial Highway viewshed will be protected visually with Retention VQO. South of Crow Creek to Naches Pass will be Partial Retention VQO along the trail and General Forest Middleground for the rest of the planning area.

Alternatives B, D and J allocate approximately one-half of the area to Maximum Modification. The areas are from the Mather Memorial Highway 410 to the Fife Peak Area, to the the Naches Pass Area. Trails will also be heavily altered. The area west of Ravens Roost to the wilderness boundary and the middleground view from Highway 410 is allocated to Partial Retention VQO.

Alternatives C and I will allocate many areas to Retention and Partial Retention VQO. Some areas will be heavily altered. The Fifes Ridge trail and the middleground view will be allocated to Maximum Modification.

Alternative E will allocate all areas to Retention VQO. Most areas will be allocated to Dispersed Recreation, Unroaded, Non-motorized. The scenic quality will be preserved under this alternative.

Alternative F will allocate most areas to Retention and Partial Retention VQO. Only a very small area will be allocated to Maximum Modification. The Raven's Roost Area north will be allocated to foreground Partial Retention VQO. The middleground areas will be Maximum Modification.

Alternative G allocates areas to Retention, Partial Retention, and some areas to Maximum Modification. The Raven's Roost Area will be General Forest in the middleground. A larger foreground trail will be allocated to Scenic Travel Partial Retention VQO.

The following table summarizes the Scenic component of this area by alternative in acres of Visual Quality Objective (VQO).

VQO	A/NFMA	B	Alternative							
			C PREFERRED	D	E	F	G	H	I	J
Preservation	--	--	--	--	--	--	--	--	--	--
Retention	6,955	5,342	6,529	5,342	11,300	8,607	8,353	6,955	6,529	2,756
Partial Retention	2,395	573	2,078	573	--	2,184	2,014	2,395	2,078	3,329
Modification	--	--	191	--	--	--	--	--	--	191
Maximum Modification	1,950	5,385	2,502	5,385	--	509	933	1,950	2,502	5,215
Total Acres	11,300	11,300	11,300	11,300	11,300	11,300	11,300	11,300	11,300	11,300

Preservation indicates that only natural ecological changes will occur.

Retention indicates an essentially natural appearing landscape will be present.

Partial Retention indicates the landscape will be slightly altered.

Modification indicates a moderately altered landscape will be present.

Maximum Modification indicates a heavily altered landscape may be present.

5. Wildlife

Alternatives A/NFMA and H would road 77 percent and emphasize timber harvest on 17 percent of the area. Alternatives B, D and J would road all of the area and allow emphasis for timber harvest on 48 percent of the area. Alternatives C and I would road 88 percent of the area but would only allow timber harvest emphasis on 22 percent of the area. Therefore A/NFMA and H would have one-third the impact of B, D and J, and C and I would have less than one-half the impact of B, D and J. Alternative E would have no impact on the wildlife resources in this area. Alternatives F and G would have more impact than A and H, but less than E.

6. Fisheries

a. Significant Effects

In Alternative E, all the areas of the Norse Peak Adjacent roadless area with fish populations would remain roadless. In the other alternatives, the stream areas would be managed in a variety of different ways. Table (A), below, depicts these management prescriptions for the areas shown.

Roading these areas could change the recreational fishing opportunities, although the total mileage of streams in this roadless area is very small. Since about two-thirds of the Forest's fishing occurs in roaded areas, it is expected that fishing would increase slightly. This would help to meet a portion of the Forest's long-term fishing demand, but also could result in overfishing and reduction in both numbers and size of fish using the habitat.

Roading the unroaded areas could also result in environmental degradation to streams due to timber harvest and road construction in the basins. Some of these possible effects are addressed in the soil and water environmental effects section. Overall, even if all areas would be roaded, it is not expected that there would be any significant effect on the resident and anadromous fish populations.

b. Mitigation Measures

In the alternatives that could road presently unroaded areas, the riparian protection zone prescription, the Wenatchee National Forest's Best Management Practices (September 1980 and revised October 1982), and all standards and guidelines common throughout riparian areas of the Forest would be applied in stream zones. This treatment should adequately protect the streams from a reduction in fish habitat capability.

If the areas are roaded, road closures could be implemented to reduce the impact of enhanced access on the native fish populations.

TABLE (A). Allocation of management prescriptions in the Norse Peak Adjacent roadless area in stream areas for Alternatives A/NFMA, B, C (Preferred), D, F, G, H, I and J. Where "Int" is shown, this indicates that an intensive timber management prescription could dominate in that area. Where "Ext" is shown, this indicates that an extended shelterwood timber management prescription would dominate in that area and would be executed primarily to meet visual objectives. Where "Rdls" is shown, this indi-

cates that the management prescription would be to maintain the area as roadless. And, where "Recreation" is shown, this indicates that the management prescription would allow the opportunity to develop a special recreation area. (m = mile)

Stream/River	A/H	B/D/J	Alternative C/I	F	G
South Fork of Little Naches	all Int	all Int	lower 1/4 m: Int	lower 1/4 m: Int	lower 1/4 m: Int
			upper 1/2 m: Ext	upper 1/2 m. Ext	upper 1/2 m: Ext
Crow Creek	border of	all Int Ext & Int	all Int	all Rdls	all Rdls
Morse Creek	all Ext	Recreation	Recreation	Recreation	Recreation

7a. Vegetation: Trees

Tree management would be planned on 7,930 acres or 70 percent of the area under Alternatives A/NFMA and H. Total vegetation manipulation area would be similar under Alternatives B, D and J. However, under these alternatives, the emphasis would be on timber production rather than other resource enhancement and protection. The White Pass Ski Area developed recreation site could use any method, including timber sales, to remove trees from ski runs or new developed areas under all alternatives.

No timber management would be permitted under Alternative E, but 4,855 acres in Alternative F, or 43 percent, would have harvest permitted with most of the acres classified Scenic Travel, Retention.

Alternatives C and I would manage 2,502 acres with emphasis on timber production (22 percent). In addition 6,699 acres could be managed for other resource values, especially scenic travel, that permit scheduled timber harvest. Total suitable forest that would be manipulated through timber sales is 5,872 or 52 percent of the area.

Alternative G emphasizes management to provide nonroaded motorized recreation on 35 percent, or 3,923 acres. Timber management would be emphasized on 993 acres.

7b. Vegetation: Forage

This roadless area is made up of two small areas adjacent to the Norse Peak Wilderness (See the Livestock write up under General Information for this area). Forage produced on one of the individual areas as part of the Forest base is not significant; however, as part of the large adjacent wilderness, it does have potential to contribute important forage for big game and livestock. Alternatives A/NFMA, B, D and J will contribute forage in excess of needs. Alternatives C, H, and I will contribute adequate forage for both livestock and big game. Alternatives E, F, and G will not produce for livestock in the fourth and fifth decade.

8. Soil and Water

a. Significant Effects

The environmental consequences of allocating the Norse Peak area to General Forest or Roadless Management are discussed by alternative below. No significant soil and water consequences are associated with Alternative E because soil and water disturbing activities occurring would be minimal. Alternatives B, D and J could allocate the entire area, and Alternatives C and I could allocate 88 percent of the area to timber harvest and road building. Alternatives A/NFMA, F, G, and H could allocate up to 70 percent of the area to timber harvest activities. The environmental effects of timber harvest and road building on soil and water are discussed in Chapter IV - Soil and Water sections.

The risk of degrading the soil and water resource increases with more timber harvest and road building. Alternatives B, D, and J pose more risk of degrading the soil and water resource than Alternatives C and I and A/NFMA, F, G, and H, respectively, due to more intensive management. However, since Wenatchee National Forest Best Management Practices (1982) and Forest Plan Standards and Guidelines will be employed, no unique soil and water effects are anticipated because of forest management in this area.

b. Mitigation Measures

The mitigation measures that will be used in this area are the same as those discussed in Chapter IV - Soil and Water sections.

9. Air

The additional prescribed burning generated in the Norse Peak Adjacent roadless area as a result of the alternatives would not have a significant effect on air quality beyond the impacts discussed in Chapter IV.

10. Minerals

As the previous discussion indicates, the southernmost parcel is encumbered by 244 lode claims and 12 placer claims. It also has reported occurrences of arsenic, copper, talc, gold, lead, molybdenum, zinc, chromium, iron, silver, tungsten, pumice, and limestone, none of which have been investigated adequately to determine if commercial deposits exist. Portions of the area are also classified prospectively valuable for coal and geothermal resources. Since none of the alternatives call for withdrawing any part of the area from mineral entry, the consequences on mineral resources does not appear to be extremely significant nor do they vary appreciably by alternative. However, the management prescriptions under which the area would be managed in each alternative would restrict mineral activities to varying degrees (i.e., special stipulations in leases and in approved operating plans). The effects of these restrictions cannot be quantified, but the negative influence they would have on interest in conducting exploration activities within the area does vary by alternative and will, therefore, affect the potential for discovering and/or developing any unknown mineral resources of the area. This relative variation between alternatives is depicted on the following table.

Consequences on Mineral Resources

Restrictive Nature of Management Prescriptions	Acres Restricted by Management Prescriptions									
	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
Withdrawn from Mineral Entry (valid existing rights will be determined and recognized)	0	0	0	0	0	0	0	0	0	0
Highly Restrictive	3,370	2,671	5,214	2,671	11,300	6,509	6,275	3,370	5,214	8,629
Moderately Restrictive	5,980	3,244	3,584	3,244	0	4,282	4,092	5,980	3,584	3,414
Relatively Few Restrictions	1,950	5,385	2,502	5,385	0	509	933	1,950	2,502	5,215

11. Roads

The miles of local roads shown below for each alternative are those that are expected to be constructed to permit timber harvest. They are included in the totals for the various alternatives shown in Chapter IV of the FEIS. It is assumed that the bulk of these roads will be constructed within the next 20 years. An analysis of the road development in unroaded areas during the past ten years indicates that for every acre harvested, approximately 5.5 acres are accessed. It is assumed that 50 percent of these roads will be closed to public traffic, and that the remainder will be suitable for travel by high clearance vehicles only.

These mileages are estimates based upon typical road densities necessary to harvest timber on different slope classes. The actual road miles that will result from the implementation of the various alternatives will be determined during project planning, design, and environmental analysis. The assumptions made for this analysis will be monitored. The construction of any road will be subject to the appropriate environmental analysis. That analysis will address the effects on resources that are dependent upon a roadless setting, including any adjacent roadless area or Wilderness. The decision to close any road will be made on a case-by-case basis, according to the Forest Road Closure Policy found in the Forest-wide Standards and Guidelines.

	<u>Alternative</u>									
	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
Miles	26	24	24	24	0	20	15	26	24	26

12. Fire

The fire management workload generated in the Norse Peak Adjacent roadless area as a result of the alternatives will not have a significant effect beyond the effects already described in Chapter IV.

A slight increase in risk of recreation related fires would occur in Alternatives E and F. Additional road access due to increased timber harvest activity would also increase risk of fire in Alternatives A/NFMA, B, C, D, H, I and J. The cost efficiency of fire suppression activities would be slightly increased in Alternatives A/NFMA, B, C, D, H, and I as road access would allow more area to be covered by ground based suppression resources. Cost efficiency levels in Alternatives E and F would be less due to slower initial attack by ground forces or the use of more expensive aerial delivered resources such as helitack or smokejumpers.

The impacts generated by slash disposal activities are discussed in Chapter IV.

13. Social/Economic

To measure this area in terms of its social value, a basic assumption is being made. That is, because of the expressed interest in keeping as much of the inventoried roadless areas as possible in an unroaded condition, the more that condition is reflected, the higher the social value.

This condition is reflected for each alternative in the summary chart under item 1, Recreation, at the beginning of this section (Section V), which indicates the acres of unroaded management.

Also, as there is varying opinion as to the mode of transportation allowed, individuals must judge for themselves which alternative best meets that aspect of the social setting. There is also a summary table reflecting this condition for each alternative as referenced above which indicates the amount of motorized versus non-motorized use within the unroaded allocation.

A general measure of timber oriented economic impacts can be made using the same table referenced above showing the amount of unroaded allocation. The larger the unroaded area, the greater the impact on timber oriented jobs. If all of the estimated long-term sustained yield per year for this area were available, it would support 26.9 jobs.

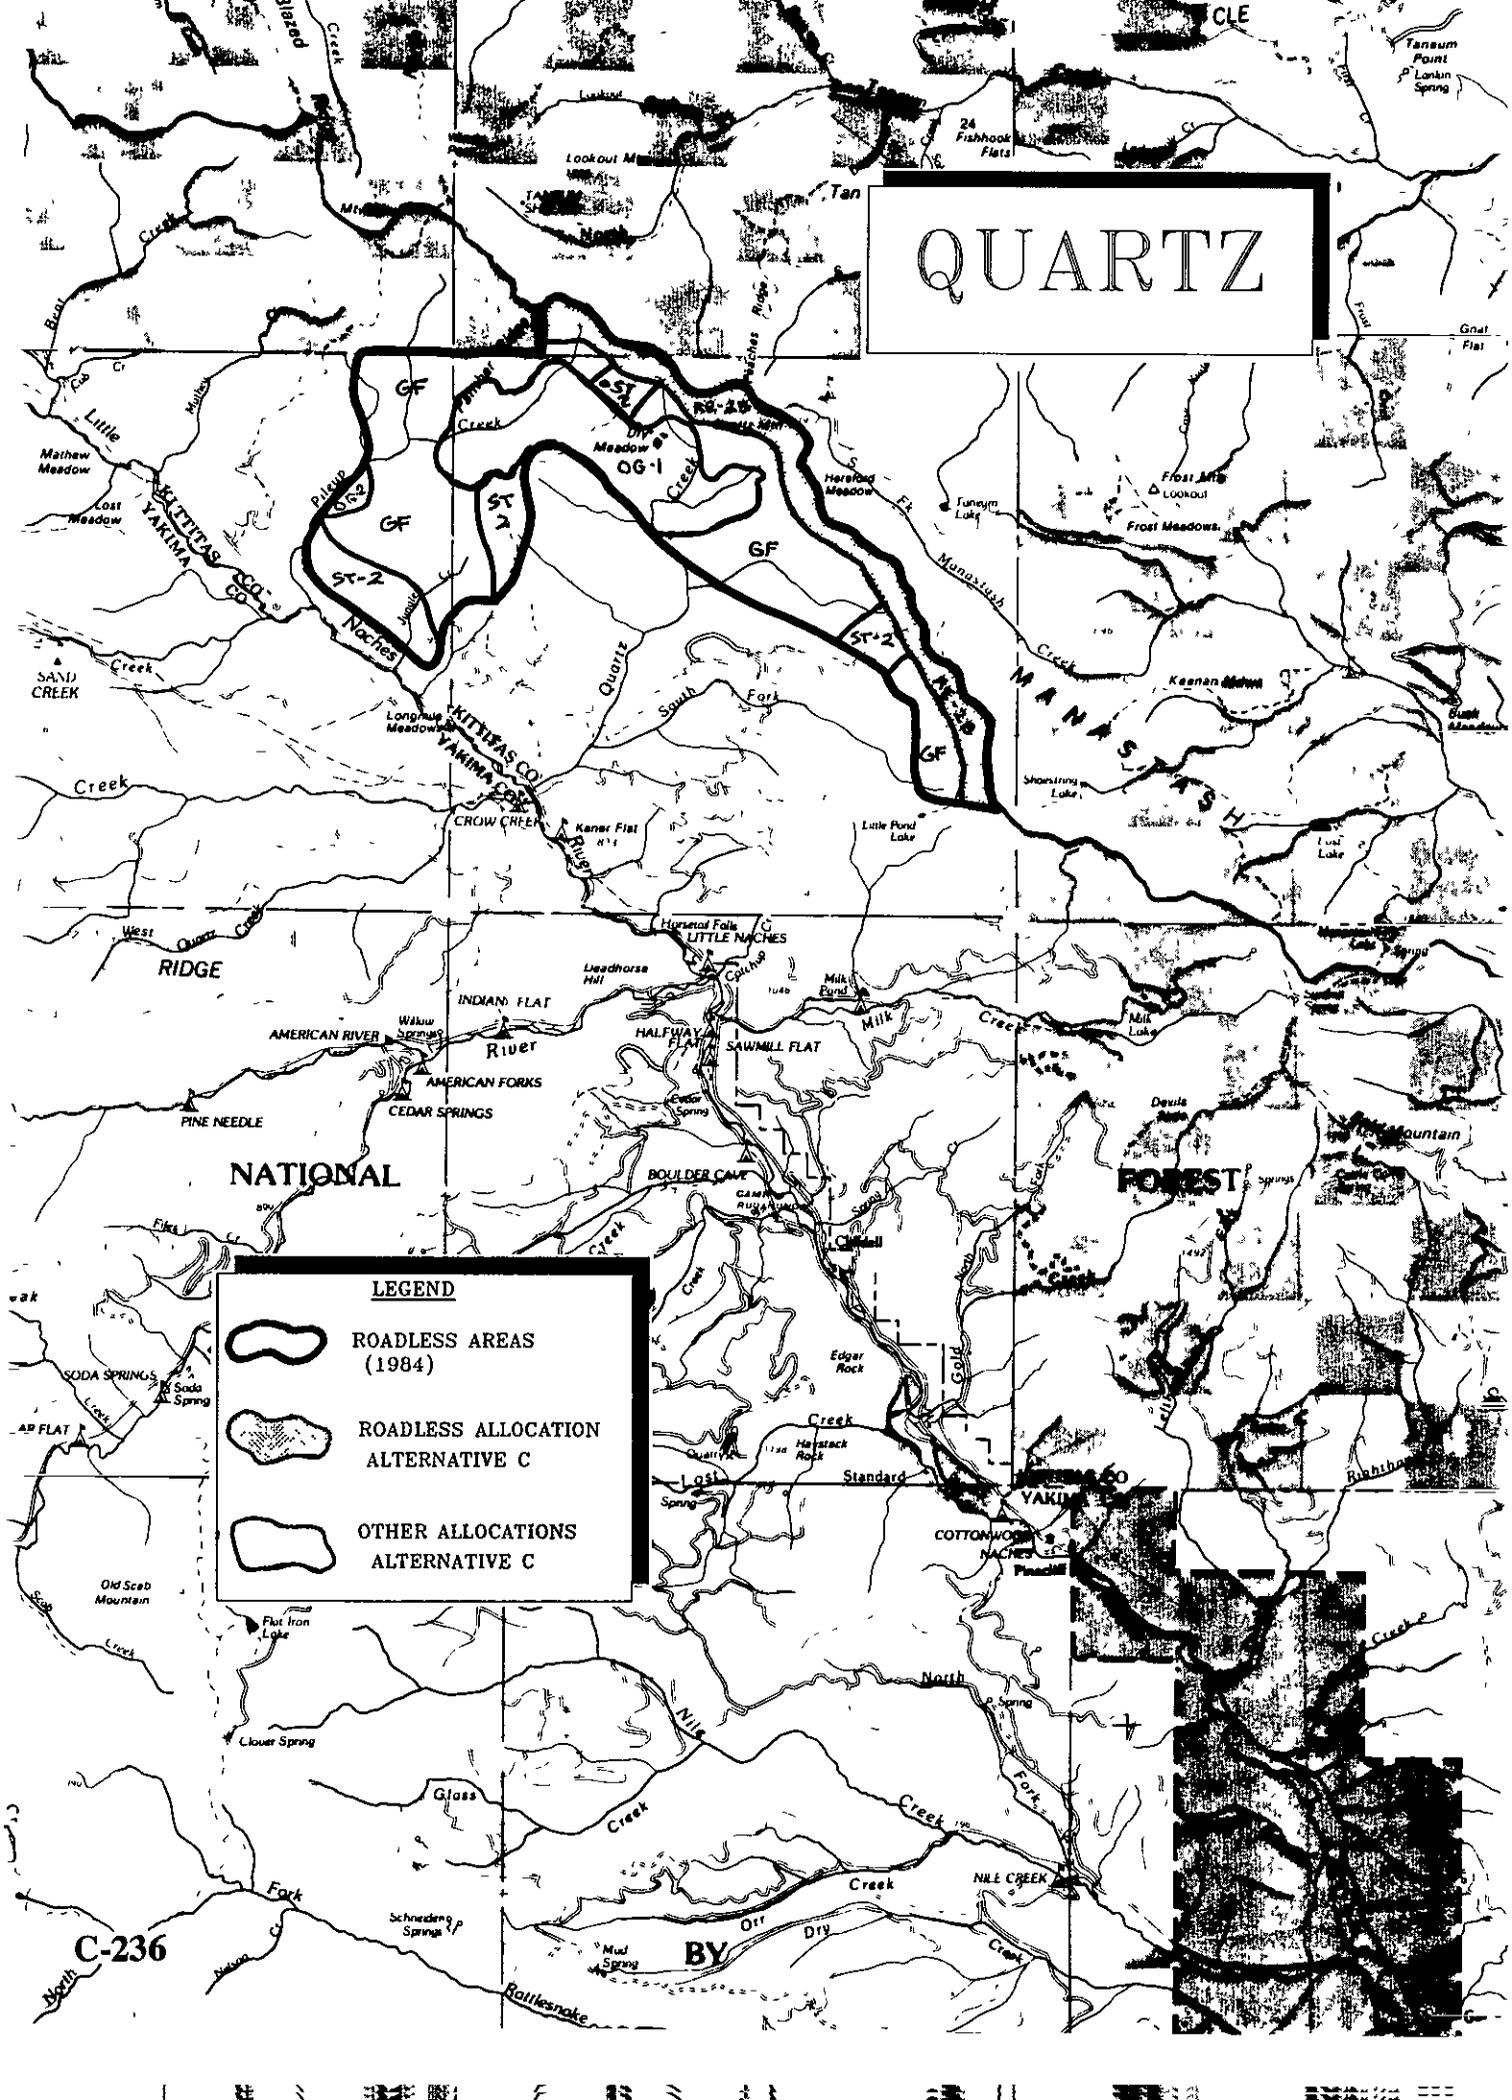

14. Wilderness Potential

The area has potential for Wilderness, however, all three areas that make up this roadless area were excluded in the analysis for the Norse Peak Wilderness. Any potential would be as additions to this Wilderness. Alternatives B, D, and J propose no allocation to unroaded prescriptions and propose the largest acreage of General Forest. Alternative E provides the most retention of Wilderness characteristics with a totally unroaded allocation. All other alternatives propose roading and development of nearly all the acres in this roadless area. There is some difference in the acreage of General Forest with Alternatives F and G allocating less than A/NFMA, C, H, and I.

QUARTZ

LEGEND

-  ROADLESS AREAS (1984)
-  ROADLESS ALLOCATION ALTERNATIVE C
-  OTHER ALLOCATIONS ALTERNATIVE C

QUARTZ ROADLESS AREA

Size: Gross Acres: 8,756

Net Acres: 8,756

I. GENERAL INFORMATION

A. History

The area was inventoried and analyzed under the RARE II effort as area No. 6033 and was not recommended for Wilderness. It was also not considered for Wilderness as part of the Washington State Wilderness Act of 1984.

B. Location and Access

The area is in Kittitas County on the Naches Ranger District and adjoins the Manastash and Taneum roadless areas. Access is by Highway 410 and the Little Naches, Quartz Mountain, Kaner Ridge, and Pileup Creek Roads.

C. Physiography and Soils

The upper elevations of this unit are characterized by long, convex grass covered ridges. The lower part (between Pileup Creek and Quartz Creek) has the large long ridge that dominates the landform. This portion of the unit is covered with dense stands of conifers. Slopes are mostly convex and are fairly uniform.

Elevations range from 3,300 to 5,900 feet. The soils in this area have developed in many different kinds of parent material. Thirty-nine percent have formed in sandstone materials, 30 percent have formed in granitic materials, 18 percent have formed in basaltic materials, 11 percent have formed in pyroclastic materials, and 2 percent have formed in glacial till material. These materials have a wide range of properties, but do have some things in common that are important to man's activities. The sandstone, basaltic, and pyroclastic soils often become sticky and slippery when wet, and all are easily compacted when moist. The granitic and glacial till materials, on the other hand, are generally coarser textured and are usually not sticky or slippery when wet. They can be compacted when moist, but are less sensitive than the former group of soils.

D. Climate

The Quartz roadless area lies within the 50 to 70 inch rainfall zone with an estimated 65 percent of the effective moisture falling as snow. There are no aerial markers or snow survey sites within the area, but average snow depths are estimated at 75 inches annually.

E. Vegetation

This area is 57 percent tentatively suitable forest land. Douglas-fir, subalpine fir, western white pine, and lodgepole pine are the major species. Open bunchgrass forb communities are restricted to the highest elevation south slope around Quartz Mountain.

F. Current Uses

The current use is for dispersed recreation. The major activities and their estimated annual use are as follows:

<u>Activity</u>	<u>Estimated Annual Recreation Visitor Days</u>
Motorized Trail Riding & 4x4	4,000
Hunting	2,000

The area contains the following kinds and amounts of Recreation Opportunity Spectrum (ROS) classes.

<u>ROS Class</u>	<u>Acres</u>
Semi-Primitive Non-motorized (SPNM)	3,498
Semi-Primitive Motorized (SPM)	5,258
Total	8,756

There are 19.0 miles of trail within the area and all are currently open to motorized use.

G. Appearance and Surroundings

The area has a moderate visual variety in landforms, vegetation, rockforms, and waterforms (lakes and streams). The highly textured steep hillsides have broad rounded sparsely vegetated ridgetops. Stream bottoms are densely vegetated while their slopes are patterned with broken, open mixed conifers.

Fall colors are present along the middle and upper slopes of the drainage.

The area is primarily viewed as foreground and middleground from trails, Quartz Mountain and Manastash Ridge. Middleground is viewed from the Little Naches road, with a portion from the Mather Memorial Highway (Highway 410), and the background is seen from Raven's Roost.

The Quartz Mountain area is surrounded by Manastash Ridge, the upper end of the Milk Creek drainage, the Little Naches drainage, and the Panther Ridge area.

H. Attractions

There are no unique features on the area. The main features are Manastash Ridge and basalt cliffs and talus slopes.

II. CAPABILITY-WILDERNESS CHARACTERISTICS

A. Manageability and Boundaries

The Quartz Mountain roadless area is bordered on the northeast by Manastash Ridge, and Forest roads and harvest units to the south and west. While the Manastash Ridge boundary would be easy to find and manage, the other boundaries following various forest roads and timber harvest units would be somewhat difficult to locate on the ground or map.

The road to Quartz Mountain is of a low standard, but the Naches Pass road at the southwest edge is a double-laned paved road with considerable recreation and timber harvest traffic. This road and other forest roads bring the sights and sounds of human intrusion into the areas on the periphery.

B. Natural Integrity

This roadless area was considered for Wilderness in 1984 and was not selected. The impact of past human activity in this area has been relatively minor even though those activities have been extensive. A system of forest roads borders the area with timber harvest units adjacent in many places. An extensive trail system provides access to Manastash Ridge at many points. This trail system has a long history of motorized use. Two trails, the Kaner Flat and Manastash Ridge trails, are four-wheel-drive routes most of their length.

C. Natural Appearance

The Quartz Mountain roadless area is large enough and the topography and vegetation are such that persons visiting the area feel that they are in a natural area away from ordinary human activity and development. Forest roads, timber harvest activities, fire lookouts, and the Raven Roost microwave tower may be seen from the higher points within this area. Most of the area has a closed evergreen canopy which reinforces a feeling of naturalness even though it is somewhat monotonous.

D. Opportunities for Solitude

The area offers good opportunities for solitude. The 8,756 acres included occur in an irregular shape that is approximately 12 miles long and 5 miles at the widest point. The three principal drainages (of which Pileup Creek is the largest) that make up this area contain deeply dissected topography and vegetative cover which easily screen people from one another at short distances.

E. Opportunities for Primitive Recreation

Opportunities for primitive recreation experiences are moderately high. The size of the area and the absence of facilities contribute to the primitive character of the area.

In spite of the good access afforded by Forest roads on the periphery and the trail system within the area, there are good opportunities for big game hunting (elk, deer, black bear and some mountain lion), horseback riding, hiking, horse camping, and some scenic viewing.

F. Challenging Experiences

This roadless area is very limited in challenging experiences. The heavy evergreen forest might be challenging to travel through for the more inexperienced visitor. A Boy Scout 50-mile hike, usually undertaken in large groups, has been proposed through this area. Wilderness designation would limit group size. Few continuous 50-mile non-Wilderness hiking opportunities remain due to 1984 Wilderness legislation.

G. Special Wildlife Features

There is no known threatened or endangered species in this area. Use of the area by sensitive species is unknown.

H. Historical and Scientific Study

There are opportunities for outdoor education, and scientific and historic study in the area relating to the archeological field.

III. RESOURCES AND POTENTIALS

A. Recreation

The area has potential value for unroaded types of recreation activities.

Estimated carrying capacity by ROS Class is as Follows:

<u>ROS Class</u>	<u>Capacity in Potential Recreation Visitor Days per Year</u>
SPNM	3,500
SPM	<u>15,800</u>
TOTAL	19,300

B. Wildlife

Elk summer habitat is provided in the area. It is also inhabited by many of the common forest animals and birds including black bear and grouse. Some mule deer also use the area.

C. Fish

This area includes the headwaters of tributaries to the Little Naches River. There are significant populations of resident cutthroat trout in Quartz Creek. Pileup Creek is used for off-channel (of the Little Naches) rearing of resident trout. With construction of a fish ladder at Salmon Falls on the Little Naches (T.18N., R.13E., section 30) scheduled for 1987, Pileup Creek will probably be utilized by anadromous fish.

D. Water

There are no water related encumbrances or planned activities within this area.

E. Livestock

This roadless area is entirely within two existing allotments. The southern edge lays within a portion of the Naches Sheep Allotment, while the northern and western portion is in the Little Naches Recreation Stock Allotment. Both allotments are used annually by livestock.

The portion in the Little Naches recreation allotment may have some potential for livestock (sheep) use when combined with adjacent areas, particularly if access was improved and transitory range was created through timber harvest.

F. Timber

The area contains 4,961 acres of tentatively suitable forest land. Stand, volume, and other data are as follows:

<u>Ecotype</u>	<u>Stand Size</u>	<u>Acres</u>	<u>Estimated Standing Volume (MMBF)</u>	<u>(MMCF)</u>
Wet	Mature	2,035	57.7	10.6
Wet	Immature	2,693	48.4	8.9
Dry	Mature	127	1.6	0.3
Dry	Immature	106	1 0	0.1
		Total 4,961	108 7	19 9

This estimated maximum biological potential contribution to the long term sustained yield is 1.7 MM Bd. Ft. (0.3 MM Cu. Ft.) per year.

G. Minerals

This area is primarily underlain by Jurassic metamorphic rocks, Eocene volcanic rocks, and Eocene nonmarine sedimentary rocks. The area has been investigated by the U.S.G.S. or U.S. Bureau of Mines, but available literature indicates there are no known mineral resource occurrences of interest. The area is classified "prospectively valuable" for coal, but there appears to be no interest in leasing it. The area is not classified "prospectively valuable" for any other commodities, but it has been leased for oil and gas. Three of the four leases terminated in 1984. According to Bureau of Land Management mining claim recordation data (1/23/85), four placer claims have been located within the area, one of which is considered abandoned for lack of required assessment work.

H. Cultural-Historical

The Quartz Mountain unit includes several known archaeological sites, with a high potential for the occurrence of additional properties. Prehistoric use of this area was intensive and was likely carried on over a period of several thousand years. In fact, a portion of the Quartz Mountain unit may qualify as an archaeological district because of the significant concentration of sites. Additional research is necessary to determine the range of historic uses.

I. Land Use

There are no special land uses within the area.

J. Fire

Annual fire occurrence is moderate; fuel loadings are heavier at lower elevations and broken up by small openings at higher elevations. Fire history is low in this area.

K. Insects and Disease

Recent heavy mountain pine beetle damage to western white pine has occurred in Quartz Creek. Lodgepole pine stands to the east are also susceptible to this insect. Root rot and mistletoe are common at lower elevation in Douglas-fir.

L. Private Lands

There are no private lands within the area.

IV. NEED

A. Nearby Wilderness and Other Roadless Areas

This area is located near the Norse Peak (50,923 acre), William O. Douglas (167,195 acres), and the Goat Rocks (105,633 acres) Wildernesses and adjacent to the Manastash and Taneum roadless areas

B. Distance from Population Centers

The area is within two to four hours driving time from population centers such as Seattle-Tacoma, Yakima, Tri-Cities, and Wenatchee.

C. Need for Ecosystem Representation

There are no special or unique ecosystems within the area in need of representation through wilderness classification.

D. Interest by Proponents, Including Congressional

There has been no active support to make the Quartz Mountain roadless area a Wilderness or designated as roadless, non-motorized. There has been interest by off-road vehicle enthusiasts to make the area roadless motorized. There has been about as much interest by the local timber industry to keep it General Forest and allow timber harvest. Congressman Morrison has supported the General Forest approach.

E. Public Input

Of 939 responses to RARE II, 86 percent favored non-wilderness, 3 percent further planning, and 11 percent Wilderness. During public meetings on the Forest Plan, motorbike users supported Roadless Motorized classification and timber industry supported General Forest classification. Local area Scout leadership is interested in a continuous 50 mile non-Wilderness hike route which traverses this area. There has been no interest in other classifications to date.

F. Other Public Involvement

In addition to the Forest Plan public meetings there have been timber sale plans adjacent to the roadless area soliciting comments. Very little interest has been shown from anyone other than the motorized vehicle users and the timber industry.

V. ENVIRONMENTAL CONSEQUENCES

A. Environmental Consequences Associated with the Alternatives

1. Recreation

a. Significant Effects

The Quartz roadless area consists of 8,756 acres on the south slopes of Manastash Ridge below Quartz Mountain and above the Little Naches River on the Naches Ranger District.

The Quartz roadless area presently hosts dispersed recreation, motorized use along developed trails. This is predominantly motorbike trail day use and four-wheel-drive day use along the ridge top. Snowmobiles also use the open ridge top and corridor routes during winter. No alternatives except E would impact present motorized use, and most alternatives would enhance this activity.

Alternative E recommends a 2,502 acre Dispersed Recreation, Non-motorized classification within the Quartz roadless area. An isolated non-motorized area of less than 5,000 acres is both difficult to manage and use. Few conflicts exist in this area at present. The present designated 50 mile non-Wilderness hiking corridor along trails through this area offers a viable alternative for large hiking groups who wish to avoid group party size limitations imposed by local wilderness. The Scouts, for example, need a 50 mile, non-Wilderness, no party size limitation, hiking corridor which this area affords.

Alternative A/NFMA, B, D, H and J allocate very little to no opportunity for unroaded motorized to non-motorized recreation. In each alternative the allocation of General Forest includes about 90% of the roadless area. Alternatives A/NFMA and H do provide allocation for protection of scenic travel ways with a partial retention allocation.

Alternatives C and I provide an even allocation with 47% of the area allocated as General Forest and 27% of the area allocated to unroaded motorized recreation and partial scenic retention. Only Alternative E provides an allocation for unroaded non-motorized recreation.

In Alternatives C and I, the portion of the trail system in this unroaded area is allocated as follows:

Trail Name	Trail Number	Unroaded Non-Motorized	Unroaded Motorized	Roaded Motorized
Quartz Mtn.	948	--	--	8.0
Quartz Creek	949	--	--	7.0
Manastash 4x4 Route	1388	--	--	4.0
Totals		--	--	19.0

b. Summary

The following tables indicate, by alternative, the degree to which this area will be allocated to roadless management and, of the roadless management acres, what percent is motorized and non-motorized. These represent the Semiprimitive Motorized and Semiprimitive Non-Motorized Recreation Opportunity Spectrum (ROS) Classes. The area being allocated to roaded types of management activities will become Roaded Natural or Roaded Modified ROS opportunities depending on the intensity of development.

Percent of the Area Having Unroaded Allocation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	1	1	13	1	100	71	96	1	13	0

Percent of the Unroaded Allocation Area
In Terms of Motorized/Non-Motorized Recreation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	100/0	100/0	100/0	100/0	71/29	100/0	100/0	100/0	100/0	0/0

The area being allocated to roaded management activities will have increased dispersed roaded recreation opportunities and the possible opening of access to potential developed recreation sites. The trail miles within the area allocated to roading may provide a less semi-primitive recreation experience with a more Roaded Natural or Roaded Modified setting.

2. Wild, Scenic, and Recreational Rivers

There are none associated with this roadless area.

3. Cultural Resources

Consideration of cultural resource values are required by a special set of historic preservation laws, regulations and policies. Particular efforts will be made in every alternative to inventory, evaluate, and provide for significant cultural resources in areas where Forest management activities are planned.

4. Scenery

Alternatives A/NFMA and H will allocate most lands to Maximum Modification VQO. Most areas except the middleground view from the Little Naches viewshed will have a heavily altered condition Quartz Mountain area viewing into Quartz Creek Basin will be heavily altered.

Alternatives B, D and J allocate almost the entire area to Maximum Modification VQO. The view from the Quartz Mountain area will be heavily altered looking west, northwest, and southwest. The middle-ground view from the Little Naches Road will be heavily altered.

Alternatives C and I will allocate much of the land to Maximum Modification VQO. The view from Quartz Mountain, Quartz Creek, and Pileup Creek basins will be allocated to General Forest. These lands will be heavily altered. Many foregrounds of trails in the area and the Little Naches viewshed will be Partial Retention VQO.

Alternative E will allocate all lands to Retention VQO. All areas will be natural appearing. Scenic quality will be retained to a very high degree.

Alternative F will allocate most areas to Retention and Partial Retention VQO. Parts of the lower end of the Little Naches viewshed will be Partial Retention VQO. Most unseen area of the Little Naches viewshed will be allocated to Maximum Modification.

Alternative G will allocate most land to Retention and Partial Retention VQO. Most areas will be Retention VQO allocated to Dispersed Recreation, Unroaded, Motorized.

The following table summarizes the Scenic component of this area by alternative in acres of Visual Quality Objective (VQO).

VQO	A/NFMA	B	C PREFERRED	D	Alternative E	F	G	H	I	J
Preservation	--	--	--	--	--	--	--	--	--	--
Retention	2,099	657	4,473	657	8,756	7,675	8,607	2,099	4,473	466
Partial Retention	361	148	148	148	--	191	64	361	148	148
Modification	--	--	--	--	--	--	--	--	--	--
Maximum Modification	6,296	7,951	4,135	7,951	--	890	85	6,296	4,135	8,142
Total Acres	8,756	8,756	8,756	8,756	8,756	8,756	8,756	8,756	8,756	8,756

Preservation indicates that only natural ecological changes will occur.

Retention indicates an essentially natural appearing landscape will be present.

Partial Retention indicates the landscape will be slightly altered.

Modification indicates a moderately altered landscape will be present.

Maximum Modification indicates a heavily altered landscape may be present.

5. Wildlife

Alternatives A/NFMA, C, H, and I would all have similar effects on wildlife. The effect of Alternatives A/NFMA, C, H, and I would be slightly less on wildlife than the effect of Alternatives B, D and J. Alternatives B, D and J would road up to 100 percent of the area and emphasize timber harvest up to 93 percent of the area. Alternative E would have an insignificant effect on wildlife. Alternatives F and G would have similar effects on wildlife which would be somewhat more than E, but considerably less than the other alternatives.

6. Fisheries

a. Significant Effects

In Alternatives E and F, all the areas with fish populations in this roadless area would remain roadless. In Alternatives A/NFMA, B, C, D, H, I and J, both the Quartz and Pileup Creek areas would become available for intensive timber harvest management. In Alternative G, the Pileup Creek and upper one-half of Quartz Creek areas would remain roadless. In Alternative G, the lower one-quarter of Quartz Creek in the roadless area would become available for intensive timber management.

Roading these areas could change the recreational fishing opportunities. Since about two-thirds of the Forest's fishing occurs in roaded areas, it is expected that recreational fishing would increase. This would help to meet a portion of the fishing demand, but also could result in overfishing and reduction in both numbers and size of fish using the habitat. Quartz Creek, in particular, would probably experience increased fishing since there is already considerable fishing in its lower reaches.

It is also possible that roading the unroaded areas could result in environmental degradation to streams due to timber harvest and road construction in the basins. Maintaining high quality rearing habitat in the lower reaches of both Quartz and Pileup Creek for anadromous fish would be a key concern. Some of the possible effects of roading these areas are also addressed in the soil and water environmental effects

b. Mitigation Measures

In the alternatives that could road presently unroaded areas in the Quartz and Pileup Creek areas, the riparian protection zone prescription, the Wenatchee National Forest's Best Management Practices (September 1980 and revised October 1982), and all standards and guidelines common throughout riparian areas of the Forest would be applied in stream zones. This treatment should adequately protect the streams from a reduction in fish habitat capability.

If the areas are roaded, road closures could be implemented to reduce the impact of enhanced access on the native fish populations.

7a. Vegetation: Trees

Tree management emphasis would be planned on 6,296 acres, or 72 percent of the area, under Alternatives A/NFMA and H. Total vegetation manipulation area would be similar under Alternatives B, D and J. However, under these alternatives the emphasis would be on timber production rather than other resource enhancement and protection.

No timber management would be scheduled under Alternative E, and only 2,501 acres, or 29 percent under Alternative F.

Alternatives C and I would manage 4,135 for timber production emphasis (47 percent). An additional 3,328 acres will be managed for other resource values, especially scenic travel, that permit scheduled timber harvest.

Alternative G emphasizes management to provide motorized unroaded recreation on 96 percent, or 8,437 acres. Timber management would be emphasized on 85 acres. The remaining 234 acres would be managed through timber sales to enhance or protect other resource values.

7b. Vegetation: Forage

This roadless area contains portions of one or more livestock allotments. (See the Livestock writeup under General Information for this area.) With the proposed vegetation manipulation in some alternatives, adequate forage will be produced for big game and livestock. This will offset the loss of forage due to natural succession and the exclusion of fire. Alternatives C, H, and I will contribute adequate forage. Forage in excess of expected needs will be produced in Alternatives A/NFMA, B, D and J. Needs for forage in the fourth and fifth decades will not be met for livestock in Alternatives E, F, and G.

8. Soil and Water

a. Significant Effects

The environmental consequences of allocating the Quartz area to General Forest or Roadless Management are discussed by alternative below. No significant soil and water consequences are associated with Alternatives E and G because soil and water disturbing activities occurring would be minimal. Alternative F could allocate up to 29 percent of the area to timber harvest and road building, while Alternatives A/NFMA, B, C, D, H, I and J could allocate up to 100 percent of the area to timber harvest activities. The

environmental effects of timber harvest and road building on soil and water are discussed in Chapter IV - Soil and Water sections.

The risk of degrading the soil and water resource in this area increases with more timber harvest and road building activity. Alternatives A, B, C, D, H, I, and J pose more risk of degrading the soil and water resource than Alternatives E and F due to more intensive management. However, since Wenatchee National Forest Best Management Practices (1982) and Forest Plan Standards and Guidelines will be employed, no unique soil and water effects are anticipated because of forest management in this area.

b. Mitigation Measures

The mitigation measures that will be used in this area are the same as those discussed in Chapter IV - Soil and Water sections.

9. Air

The additional prescribed burning generated in the Quartz roadless area as a result of the alternatives would not have a significant effect on air quality beyond the impacts discussed in Chapter IV.

10. Minerals

Since this area appears to have a low potential for the occurrence of mineral resources, the consequences on mineral resources do not appear to be extremely significant nor do they appear to vary appreciably by alternative. However, the management prescriptions under which the area would be managed in each alternative would restrict mineral activities to varying degrees (i.e., special stipulations in leases and in approved operating plans). The effects of these restrictions cannot be quantified, but the negative influence they would have on interest in conducting exploration activities within the area does vary by alternative and will, therefore, affect the potential for discovering and/or developing any unknown mineral resources of the area. This relative variation between alternatives is depicted on the following table.

Consequences on Mineral Resources

Restrictive Nature of Management Prescriptions	Acres Restricted by Management Prescriptions									
	A/NFMA	B	C PREFERRED	Alternative D	E	F	G	H	I	J
Withdrawn from Mineral Entry (valid existing rights will be determined and recognized)	0	0	0	0	0	0	0	0	0	0
Highly Restrictive	212	254	3,074	254	8,756	6,340	8,501	212	3,074	148
Moderately Restrictive	2,248	551	1,547	551	0	1,526	170	2,248	1,547	466
Relatively Few Restrictions	6,296	7,957	4,135	7,951	0	890	85	6,296	4,135	8,142

11. Roads

The miles of local roads shown below for each alternative are those that are expected to be constructed to permit timber harvest. They are included in the totals for the various alternatives shown in Chapter IV of the FEIS. It is assumed that the bulk of these roads will be constructed within the next 20 years. An analysis of the road development in unroaded areas during the past ten years indicates that for every acre harvested approximately 5.5 acres are accessed. It is assumed that 50 percent of these roads will be closed to public traffic, and that the remainder will be suitable for travel by high clearance vehicles only.

These mileages are estimates based upon typical road densities necessary to harvest timber on different slope classes. The actual road miles that will result from the implementation of the various alternatives will be determined during project planning, design, and environmental analysis. The assumptions made for this analysis will be monitored. The construction of any road will be subject to the appropriate environmental analysis. That analysis will address the effects on resources that are dependent upon a roadless setting, including any adjacent roadless area or wilderness. The decision to close any road will be made on a case by case basis, according to the Forest Road Closure Policy found in the Forest-wide Standards and Guidelines.

	<u>Alternative</u>									
	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
Miles	19	18	18	18	0	5	1	19	18	19

12. Fire

The fire management workload generated in the Quartz roadless area as a result of the alternatives will not have a significant effect beyond the effects already described in Chapter IV.

A slight increase in risk of recreation related fires would occur in Alternatives E, F, and G. Additional road access due to increased timber harvest activity would also increase risk of fire in Alternatives A/NFMA, B, D, H and J.

The cost efficiency of fire suppression activities would be slightly increased in Alternatives A/NFMA, B, D, H and J as road access would allow more area to be covered by ground based suppression resources. Cost efficiency levels in Alternatives E, F, and G would be less due to slower initial attack by ground forces or the use of more expensive aerial delivered resources such as helitack or smokejumpers.

The impacts generated by slash disposal activities are discussed in Chapter IV.

13. Social/Economic

To measure this area in terms of its social value, a basic assumption is being made. That is, because of the expressed interest in keeping as much of the inventoried roadless areas as possible in an unroaded condition, the more that condition is reflected, the higher the social value.

This condition is reflected for each alternative in the summary chart under item 1, Recreation, at the beginning of this section (Section V), which indicates the acres of unroaded management.

Also, as there is varying opinion as to the mode of transportation allowed, individuals must judge for themselves which alternative best meets that aspect of the social setting. There is also a summary table reflecting this condition for each alternative as referenced above which indicates the amount of motorized versus non-motorized use within the unroaded allocation.

A general measure of timber oriented economic impacts can be made using the same table referenced above showing the amount of unroaded allocation. The larger the unroaded area, the greater the impact on timber oriented jobs. If all of the estimated long-term sustained yield per year for this area were available, it would support 20.2 jobs.

14. Wilderness Potential

This roadless area has very limited potential for Wilderness. Its 8,756 acre size is a limiting factor as well as its isolation from other Wilderness.

Only Alternatives E, F, and G retain a large portion of the area in unroaded conditions. All other alternatives retain only a range of 1 percent to 6 percent of the area in unroaded condition. Alternatives B, D, and J propose a major portion of the area, up to 93 percent in General Forest. Alternatives C and I prescribe an even resource allocation with 4,135 acres allocated to General Forest. Alternatives A/NFMA and H allocate more acres to unroaded allocations and nearly the same acres to roaded allocations.

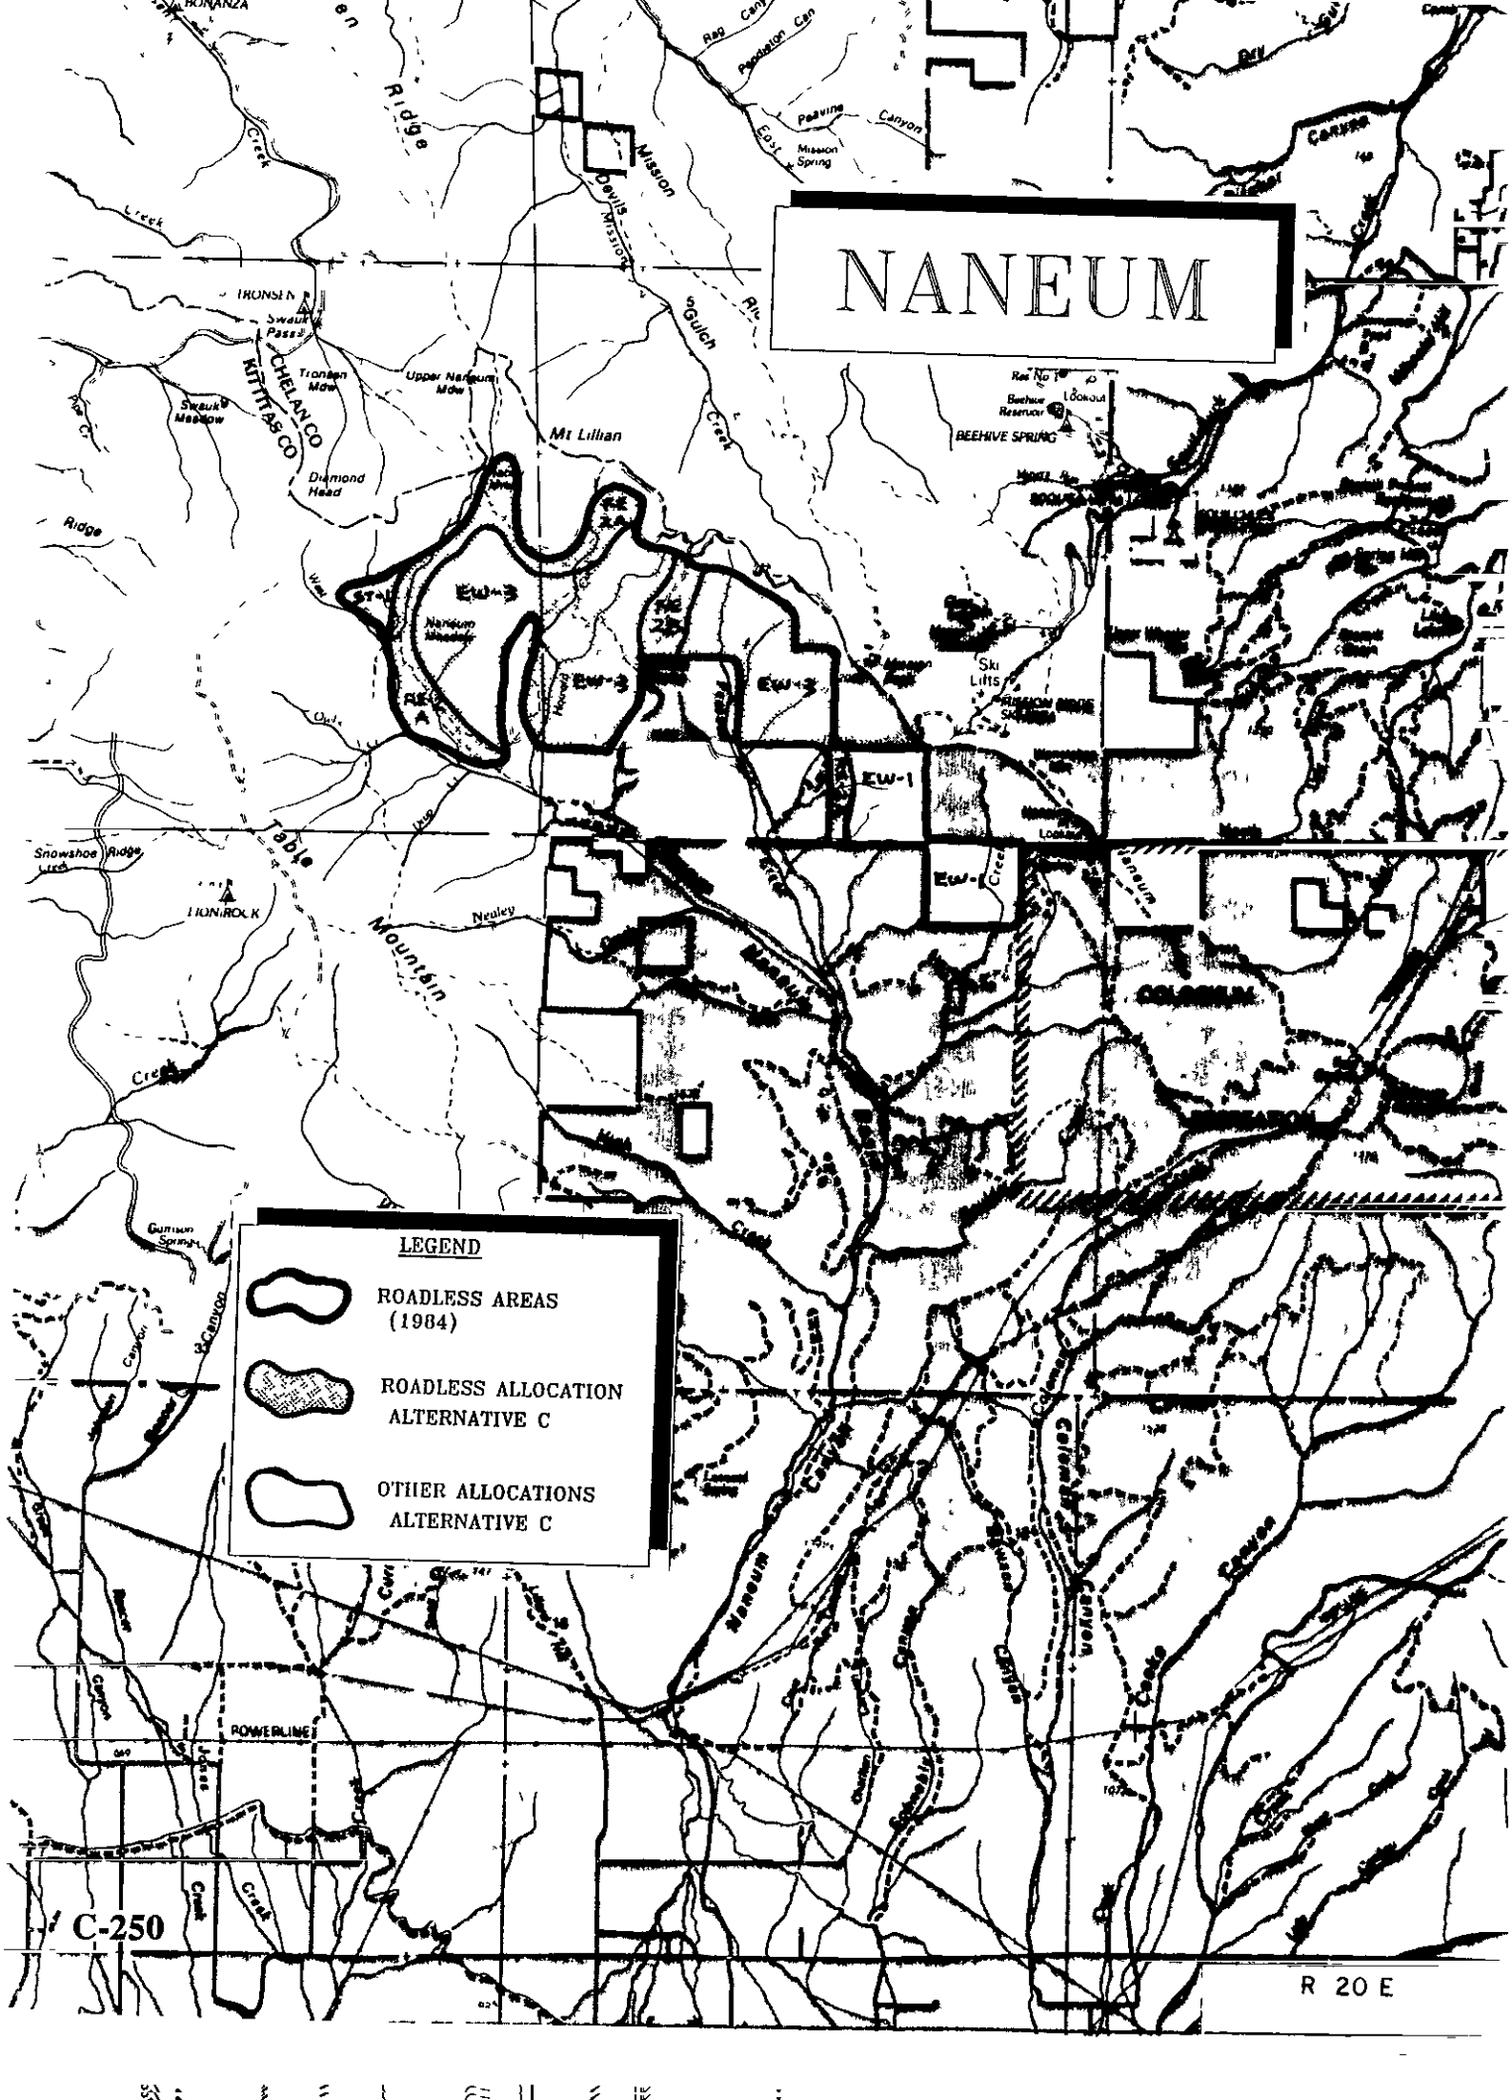

NANEUM

LEGEND

-  ROADLESS AREAS (1984)
-  ROADLESS ALLOCATION ALTERNATIVE C
-  OTHER ALLOCATIONS ALTERNATIVE C

C-250

R 20 E

NANEUM ROADLESS AREA

Size: Gross Acres: 8,310

Net Acres: 6,911

I. GENERAL INFORMATION

A. History

The area was inventoried and evaluated under RARE II as Area No. 6039 and was not recommended for Wilderness. It was not part of the Washington State Wilderness Act of 1984 assessment.

B. Location and Access

The area is located in Kittitas County on the Cle Elum Ranger District. Major access is obtained by the Liberty-Beehive and Howard Creek roads.

C. Physiography and Soils

This area is characterized by its position at the head of a large drainage basin. The slopes are fairly gentle and smooth and the area is covered with conifers. Elevations range from 4,900 to 5,700 feet. Most of the soils have formed in either basaltic materials or sandstone materials; however, there is a small percentage (two percent) of soils that have formed in colluvial materials. The basaltic soils are usually darker in color than the sandstone soils and most are medium textured whereas in the sandstone soils textures can range from coarse sandy loams to clay loams. Both soils can be sticky and slippery when wet; both are subject to compaction when moist. The sandstone soils tend to be more erosive than the basaltic soils. Soil depths can range from as little as 2 or 3 inches to as much as 60 inches; however, most are about 30 inches deep.

D. Climate

The Naneum Roadless Area is one of the more easterly locations with a uniform 25 inches of annual precipitation. This area is in the vicinity of Table Mountain in a rainfall zone of equal annual precipitation persisting over a relatively large area. Snow depth peaks at approximately 50 inches with the mean annual depth averaging 30 inches on March 1.

E. Vegetation

Fifty-two percent of this area is tentatively suitable forest land. This area supports an eastside, high, relatively dry vegetative type dominated at lower elevations by Douglas-fir and ponderosa pine. With increasing elevation, grand fir then Englemann spruce, lodgepole pine, and western larch replace Douglas-fir. Subalpine-fir is the most common species mixed with lodgepole pine on the higher elevation Table Mountain area. Both wet and dry meadows are interspersed in this area and support forbs and grasses developed through heavy use by both elk and domestic cattle grazing.

Some adjacent harvest areas were backlog reforestation problem areas. Severe pinegrass, sedge, domestic grass competition, and gopher damage were listed as the causes during a regional reforestation review. Shelterwood cuttings and reforestation with lodgepole pine and Englemann Spruce instead of Douglas-fir appears to have solved these problems on more recent harvest areas.

F. Current Uses

The current use is for dispersed recreation. The major activities and their estimated annual use are as follows:

<u>Activity</u>	<u>Estimated Annual Recreation Visitor Days</u>
Snowmobiling	200
Horseback Riding	700
Hunting	1,000
Total	1,900

The area contains the following kinds and amounts of Recreation Opportunity Spectrum (ROS) Classes:

<u>ROS Class</u>	<u>Acres</u>
Semi-Primitive Non-Motorized (SPNM)	2,946
Semi-Primitive Motorized (SPM)	3,965
Total	6,911

There are 13.8 miles of trail within the area and all are currently open to motorized use. The area trails are also very popular for horseback riders operating from Haney Meadows.

G. Appearance and Surroundings

The area has moderate visual variety in landforms, moderate to high variety in vegetation and rockforms, and moderate variety in waterforms (lakes and streams). Small streams and high elevation meadows have high visual variety as do Mission Peak and the adjacent ridgetops.

The area has a moderate-to-steep, broken, open textured landscape with interspersed rock formations. Fall colors occur on the contrasting ridgetops, and there is a high vegetative mix of conifers with meadows on moderate slopes and flat areas.

The area is primarily foreground and middleground when viewed from Liberty Beehive road, Mission Peak, Mission Ridge Ski Area, Naneum Point lookout, and the Naneum road. It is foreground from the few trails in the area.

The Naneum area is surrounded by the Liberty-Beehive road, the Chelan-Kittitas County line, the upper drainage of the Naneum basin, and Table Mountain.

H. Attractions

Major features are Naneum Creek and Meadows and Haney Meadow.

II. CAPABILITY-WILDERNESS CHARACTERISTICS

A. Manageability and Boundaries

The Naneum roadless area is bordered on the west and north by Forest Service roads. The southeast portion of this area is "checkerboard" ownership and is identified by section lines. Prominent features in the area are Naneum Meadows and Haney Meadows. The remainder of the area is typically covered by dense stands of timber. The boundary is difficult to locate on the ground except where delineated by forest roads.

B. Natural Integrity

There are 13.8 miles of system trail in the area, consisting of portions of Trails 1381, 1389, 1372, and 1373. The Grouse Springs Road, a low-standard dirt road used mostly as a 4X4 route, bisects the area from north to south. There are fences around Haney and Naneum Meadows. All portions of the roadless area are within one mile of a road or trail.

The entire area is under a grazing allotment. Most of the area is covered by dense forest and relatively unaffected by management activities. The meadows are used by wildlife, and domestic and recreational livestock. Motorized use has largely been restrained in the meadows by fencing.

C. Natural Appearance

The dense forest contributes to the natural appearance of the area within a short distance of roads and trails. The dense vegetative screening readily absorbs the impacts of motorized and domestic livestock use in the area. Evidence of adjacent management is also well screened.

D. Opportunities for Solitude

The area receives moderate use by a variety of user groups. Horseback riding is a prominent use of the area, most often by small groups but with occasional use by large organized groups. Motorcyclists also use the area but seldom come in direct contact with other users.

Proximity to roads and trails along with multiple use on the trails minimizes the opportunities for solitude. Roads encircle the area and traffic can be heard from most locations. There is continued moderate use by both horseback riders and motorcyclists with occasional periods of heavy use. The lands surrounding this area attract a wide variety of recreation and management uses, thus drawing many people to this area as well.

E. Opportunities for Primitive Recreation

This roadless area has a low potential for primitive recreation. Topography and vegetation provide good screening; however, all points are close to the perimeter and are readily accessible. There is moderate diversity in the area and challenges are very limited. The primary types of primitive recreation occurring in the area are hunting and horseback riding, with lesser amounts of hiking and ski touring.

F. Challenging Experiences

The opportunities for challenging experiences are extremely limited. Uses of this area are typified by casual hiking, horseback riding, and motorized use. Hunters and touring skiers may find the area more challenging when using it in conjunction with adjacent areas thus increasing the distances traveled. The terrain lacks diversity and is too accessible to provide meaningful challenges in terms of distance or complexity. Opportunities for motorized winter use are very good. When considered with the adjacent lands, it provides both a large area and a long season for snowmobilers.

G. Special Wildlife Features

There have been sightings of peregrine falcon reported but no nesting sites have been located. No other threatened or endangered species have been found in the area. The extent of use in the area by sensitive species is unknown.

H. Historical and Scientific Study

A portion of this area is candidate for a Research Natural Area because it typifies high elevation lodgepole pine not currently represented in the RNA system.

Wilderness classification is not needed to accommodate the above.

III. RESOURCES AND POTENTIALS

A. Recreation

The area has potential value for unroaded types of recreation activities.

Estimated carrying capacity by ROS class is as follows:

<u>ROS Class</u>	<u>Capacity in Potential Recreation Visitor Days Per Year</u>
SPNM	2,900
SPM	11,900
Total	14,800

B. Wildlife

The area is summer range for a large elk population and a small deer population. Black bear and grouse also make use of the area.

C. Fish

In this roadless area, the Naneum is the only major creek. Howard Creek and the main Naneum support cutthroat trout, which are probably all wild. Haney and Naneum Meadow have small populations of trout, although at times the creek almost goes dry.

Small portions of Pearson and Swift Creeks are also in the area, but probably have only minor cutthroat trout populations.

D. Water

There are no water related encumbrances or planned activities within the area.

E. Livestock

The eastern half of this area is within a portion of the First Creek Cattle Allotment. The western half is made up of four sections of checkerboarded private ownership. This portion along Mission Ridge is high elevation, with relatively steep topography and has little potential for allotments.

F. Timber

The area contains 3,604 acres of tentatively suitable forest land. Stand, volume, and other data are as follows:

Ecotype	Stand Size	Acres	Estimated Standing Volume (MMBF)	(MMCF)
Wet	Mature	1,484	42.1	7.7
Wet	Immature	1,526	27.4	5.0
Dry	Mature	276	3.5	0.6
Dry	Immature	318	3.1	0.6
	Total	3,604	76.1	13.9

The estimated maximum biological potential contribution to the long-term sustained yield is 1.2 MM Bd. Ft. (0.2 MM Cu. Ft.) per year.

G. Minerals

The area is primarily underlain by Miocene volcanic rocks (Columbia River basalts), but along the northern portion nonmarine sedimentary rocks of the Swauk formation outcrop on the surface. The area has not been investigated by the U.S.G.S. or U.S. Bureau of Mines, but available references indicate no known mineral resource occurrences of interest. The entire area is classified “prospectively valuable” for oil and gas and the north-half is classified “prospectively valuable” for coal resources. The area also has minor potential for the occurrence of gold resources, but direct evidence is lacking. It has also been nominated as an “area of critical mineral potential” through a Bureau of Land Management nomination process (Bee, 1983).

Even though the area has no proven mineral resources of a significant nature, there appears to be some interest in it. According to BLM mining claim recordation data, 173 lode claims and 2 placer claims have been located within or immediately adjacent to the area. Assessment work appears to have been maintained on most of these claims; however, it is not known whether the claims were located for known resources or in speculative response to the on-going activity near Wenatchee. Portions of the area have also been leased for its oil and gas resources, but it has not yet experienced any exploration drilling so its actual oil and gas potential is not known. There is no apparent interest in the area’s coal resource potential.

H. Cultural-Historical

The upper Naneum country, with its numerous meadows and open terrain, was once used by Indian groups in the collection of roots. There have been few cultural resource surveys of this area to determine actual archaeological distributions, but within undisturbed areas the potential is high for such occurrences. Historic uses have been minor, and relate primarily to cattle and sheep grazing.

I. Land Use

There are no special land uses within the area.

J. Fire

Annual fire occurrence is low with fuel loadings ranging from areas of heavy down accumulations of ground fuels to clean stands of lodgepole pine, and scattered alpine and sage meadow. Fire history consists of periodic fires of one to 20 acres in size.

K. Insects and Disease

Douglas-fir mistletoe is the most serious problem in this area. Both western spruce budworm and a related larch budworm were active in this area in 1976 prior to aerial spray programs.

L. Private Lands

The State of Washington owns 1,399 acres of land within the area.

In a nearly complete exchange with the State of Washington Department Natural Resources, the U.S. is trading out of T.21N., R.19E., W.M., Sections 28 and 32; T.20N. R.19E. W.M., Section 2 is also part of the trade.

IV. NEED

A. Nearby Wilderness and Other Roadless Areas

This area is located within 15 to 20 miles of the 393,360 acre Alpine Lakes Wilderness Area and south of the Mission Creek and northeast of the Lion Rock roadless areas respectively.

B. Distance from Population Centers

The area is within two to four hours driving time from population centers such as Seattle-Tacoma, Yakima, Tri-Cities, and Wenatchee.

C. Need for Ecosystem Representation

There are no special or unique ecosystems within the area in need of representation through Wilderness classification.

D. Interest by Proponents, Including Congressional

Since the passage of the Washington State Wilderness Act of 1984, there has been no expressed interest for Wilderness classification for this area by proponents or Congressional factions.

However, there have been proposals by both environmental and off-road vehicle users to maintain roadless status for the area.

E. Public Input

Public input during the RARE II and other planning efforts was obtained and supported unroaded allocations. Of 734 responses, results were 86 percent for non-wilderness, 3 percent for further study, and 11 percent for wilderness.

F. Other Public Involvement

Public input solicited during the formulation of alternatives for this plan indicated much support for dispersed, unroaded recreation use for the area. There is a difference of opinion as to whether this should be motorized or nonmotorized use.

V. ENVIRONMENTAL CONSEQUENCES

A. Environmental Consequences Associated with the Alternatives

1. Recreation

a. Significant Effects

The Naneum roadless area consists of 6,911 acres located in north Kittitas County, east of Table Mountain.

The roadless area has been inventoried according to the Recreation Opportunity Spectrum (ROS). The inventory shows that the area has the ability to provide 2,946 acres of Semi-primitive, Non-Motorized, and 3,965 acres of Semi-primitive, Motorized use.

Alternatives E and F allocate 5,957 acres to Dispersed Motorized Recreation as an extension of that allocated in Mission Creek to the north. This allocation would shift the recreation emphasis to primarily motorized trail use of the area. The visual appearance would remain similar to the current situation. The intensity will increase, resulting in more frequent encounters with other users.

Alternative E also allocates 424 acres to Non-motorized Dispersed Recreation which would increase the access for horseback trail riders and hikers. This allocation would increase access to scenic vista points in the area.

All alternatives, except E, provide for a limited development campground allocation in the Haney Meadows area. This area is a commonly used departure point for horseback trail riding. Horse use would continue to be the primary trail use in this area in all alternatives except E and F. In these two alternatives, the allocation to motorized will shift use away from horseback riding and toward trail bike use.

Alternatives A/NFMA, B, D, G, H and I allocate essentially no areas for unroaded motorized or non-motorized recreation. The emphasis in B and D is an intensive Range Management which would provide for recreation opportunities that would blend with range improvements and development. Alternative A, G, H and J emphasize a blend of commodity/amenity values. Disposed recreation opportunities would be most compatible with this emphasis.

Alternatives C and I allocated a blend of emphasis with 67% of the area allocated to unroaded motorized recreation. The small trail system is allocated as follows:

Trail Name	Trail Number	Unroaded Non-Motorized	Unroaded Motorized	Roaded Motorized
Grass Camp	1500	--	--	5.0
Howard Creek	1503	--	--	5.2
Old Ellensburg	1511	--	--	3.6
Totals		--	--	13.8

b. Summary

The following tables indicate, by alternative, the degree to which this area will be allocated to roadless management and, of the roadless management acres, what percent is motorized and non-motorized. These represent the Semiprimitive Motorized and Semiprimitive Non-Motorized Recreation Opportunity Spectrum (ROS) Classes. The area being allocated to roaded types of management activities will become Roaded Natural or Roaded Modified ROS opportunities depending on the intensity of development.

Percent of the Area Having Unroaded Allocation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	1	8	67	8	100	94	8	1	67	8

Percent of the Unroaded Allocation Area
In Terms of Motorized/Non-Motorized Recreation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	100/0	0/100	97/3	0/100	86/14	92/8	0/100	100/0	97/3	0/100

The area being allocated to roaded management activities will have increased dispersed roaded recreation opportunities and the possible opening of access to potential developed recreation sites. The trail miles within the area allocated to roading may provide a less semi-primitive recreation experience with a more Roaded Natural or Roaded Modified setting.

2. Wild, Scenic, and Recreational Rivers

There are none associated with this roadless area.

3. Cultural Resources

Consideration of cultural resource values are required by a special set of historic preservation laws, regulations and policies. Particular efforts will be made in every alternative to inventory, evaluate, and provide for significant cultural resources in areas where Forest management activities are planned.

4. Scenery

Alternatives A/NFMA and H will allocate most lands to Partial Retention VQO. Some lands will be Retention and Maximum Modification VQO. The middleground view of the Liberty-Beehive travel route will be allocated to Maximum Modification.

Alternatives B and D allocate much of the land to Intensive Range Management. These lands will be heavily altered to provide maximum grasses for the animals. Most lands will be Maximum Modification VQO. The Liberty-Beehive travel route will be heavily altered. A small area is allocated to a Research Natural Area. These lands may be difficult to protect because the Intensive Range Management prescription surrounds the area. Alternative J allocates most of the area to big game habitat or intensive range management.

Alternatives C and I will allocate a large percentage of the area to Retention and Partial Retention VQO. Most areas will have Scenic Travel prescriptions. The Liberty-Beehive travel route will be Retention VQO. Trails in the area will be Partial Retention VQO. Most middleground view will be Partial Retention VQO.

Alternative E will allocate all lands to Preservation and Retention VQO. Scenic quality will dominate the landscape.

Alternative F will allocate all lands to Preservation, Retention and Partial Retention VQO. The Research Natural Area is surrounded by Dispersed Recreation, Unroaded Motorized allocations. These lands may need protection or trails to bypass the Research Natural Area.

Alternative G allocates all lands to Preservation, Retention, and Partial Retention. Most foreground trails will be Retention VQO. The middleground view will be allocated to Partial Retention VQO.

The following table summarizes the Scenic component of this area by alternative in acres of Visual Quality Objective (VQO).

VQO	A/NFMA	B	Alternative							
			C PREFERRED	D	E	F	G	H	I	J
Preservation	--	530	--	530	530	530	530	--	--	530
Retention	2,883	466	4,982	466	6,381	6,212	1,759	2,883	4,982	275
Partial Retention	933	636	42	636	--	169	1,484	933	42	636
Modification	2,205	5,279	1,887	5,279	--	--	3,138	2,205	1,887	5,470
Maximum Modification	890	--	--	--	--	--	--	890	--	--
Total Acres	6,911	6,911	6,911	6,911	6,911	6,911	6,911	6,911	6,911	6,911

Preservation indicates that only natural ecological changes will occur.

Retention indicates an essentially natural appearing landscape will be present.

Partial Retention indicates the landscape will be slightly altered.

Modification indicates a moderately altered landscape will be present.

Maximum Modification indicates a heavily altered landscape may be present.

5. Wildlife

Alternatives A/NFMA and H would road essentially all of the area but only emphasize timber management on 11 to 13 percent of the area. Alternatives B, D and J would road 92 percent of the area, have no General Forest allocation, but would have a range allocation on up to 63 percent of the area. Alternative J allocate 79 percent of the area to either big game habitat or intensive range management. Since the potential for conflict with elk management in the area from the range allocation is greater than that from the timber allocation, Alternatives A/NFMA, C, H, and I would rate better than B, D and J Alternatives G, and H would have similar impacts on wildlife. These impacts would be similar to Alternatives A/NFMA and H due to the amount of roads in the area. Alternatives E and F would have the least impact on wildlife. Alternatives C and I would have the next least impact with 75 percent of the area allocated to big game habitat, roaded and unroaded.

6. Fisheries

a. Significant Effects

In Alternatives E and F, all areas with fish populations in this roadless area would remain roadless. In the other alternatives, the stream and meadow areas with fish would be managed in a variety of different ways. Table (A) depicts these management prescriptions.

Roading these areas could change the recreational fishing opportunities, although the total mileage of streams in this roadless is quite small. Since about two-thirds of the Forest's fishing occurs in roaded areas, it is expected that fishing would increase slightly. This would help to meet a portion of the long-term fishing demand, but also could result in overfishing and reduction in both numbers and size of fish using the habitat. This would be of particular concern at both Haney and Naneum Meadows which have very small and possibly special populations of fish.

Roading the unroaded areas could also result in environmental degradation to streams due to timber harvest and road construction in the basins. Some of these possible effects are addressed in the soil and water environmental effects section.

b. Mitigation Measures

In the alternatives that could road presently unroaded areas, the riparian protection zone prescription, the Wenatchee National Forest's Best Management Practices (September 1980 and revised October 1982), and all standards and guidelines common throughout riparian areas of the Forest would be applied in stream zones. This treatment should adequately protect the streams from a reduction in fish habitat capability.

If the areas are roaded, road closures could be implemented to reduce the impact of enhanced access on the native fish populations. Any roads constructed near Haney and Naneum Meadows should be located and designed to help preserve the native fish populations at these sites.

TABLE (A). Allocation of management prescriptions in the Naneum Roadless Area in stream areas for Alternatives A/NFMA, B, C (Preferred), D, G, H, I and J. Where "Ext." is shown, this indicates that an extended shelterwood timber management prescription would dominate in that area and would be executed primarily to meet visual objectives. Where "RNA" is shown, this indicates that the area would be designated a Research Natural Area, and managed as such. Where "Big Game" is shown, this indicates that the management prescription would be to produce maximum appropriate forage for big game. And where "Range" is shown, this indicates that the principal management prescription would be to benefit domestic livestock. (M = mile)

Stream/River	Alternative			
	A/H	B/D/J	C/I	G
Naneum Creek	Lower 1 1/2 M: Big Game Upper 1 1/2 M: Ext.	All Range	All Ext.	All Ext.
Haney Meadows	All Ext	All Range	All Ext	All Ext.
Naneum Meadows	All Big Game	All RNA	All Range	All RNA

7a. Vegetation: Trees

As presently allocated under the Kittitas Land Use Plan, and proposed in Alternatives A/NFMA and H, most of the vegetation manipulation proposed for this area is for scenic travel or big game management.

Under Alternatives B and D the emphasis would switch from big game and scenic travel emphasis to intensive range management. Alternative J would emphasize big game habitat and intensive range management.

Alternatives C, I and G would eliminate any timber emphasis and increase big game habitat management over the current situation. They would also decrease the scenic travel retention area while slightly increasing the partial retention. Alternative C and I also allocate 3,307 acres (48 percent) to an unroaded big game habitat prescription.

All alternatives except A/NFMA, C, H and I would establish a 530 acre Research Natural Area. All alternatives except A/NFMA and E would propose to establish old-growth management areas. Under Alternative E, the entire area would be unroaded recreation with emphasis on motorized use.

7b. Vegetation: Forage

This roadless area contains portions of one or more livestock allotments. (See the Livestock writeup under General Information for this area) With the proposed vegetation manipulation in some alternatives, adequate forage will be produced for big game and livestock. This will affect the loss of forage due to natural succession and the exclusion of fire. Alternatives C, H, and I will contribute adequate forage. Forage in excess of expected needs will be produced in Alternatives A, B, and D. Needs for forage in the fourth and fifth decades will not be met for livestock in Alternatives E, F, and G.

8. Soil and Water

a. Significant Effects

The environmental consequences of allocating the Naneum Area to General Forest or Roadless Management are discussed by alternative below. No significant soil and water consequences are associated with Alternatives E and F because soil and water disturbing activities would be minimal. Alternatives A/NFMA, H and J could allocate up to 100 percent of the area to timber harvest and road building. Alternatives B, D, and G allocate 92 percent of the area to potential roaded prescription. In Alternatives B and D, 76 percent of the area could be allocated to domestic livestock grazing. Alternatives C and I allocate 67 percent of the area to unroaded allocations. The environmental effects of timber harvest, road building, and livestock grazing on soil and water are discussed in Chapter IV - Soil and Water sections.

The risk of degrading the soil and water resource in this area increases with more timber harvest and road building activity. Alternatives A, B, D, G, H, and J pose more risk of degrading the soil and water resource than Alternatives C, E, F and I due to more intensive management. However, since Wenatchee National Forest Best Management Practices (1982) and Forest Plan Standards and Guidelines will be employed, no unique soil and water effects are anticipated because of forest management in this area.

b. Mitigation Measures

The mitigation measures that will be used in this area are the same as those discussed in Chapter IV - Soil and Water sections.

9. Air

The additional prescribed burning generated in the Naneum roadless area as a result of the alternatives would not have a significant effect on air quality beyond the impacts discussed in Chapter IV.

10. Minerals

As the previous discussion indicates, the area is encumbered by 173 lode claims and 2 placer claims, and it has been leased for oil and gas. Even though it has no known mineral resource occurrences, it is considered to have potential for the occurrence of gold and oil and gas, and it has been identified as an area of critical mineral potential. The management prescriptions under which the area would be managed in each alternative would restrict mineral activities to varying degrees (i.e. special stipulations in leases and in approved operating plans). The effects of these restrictions cannot be quantified, but the negative influence they would have on interest in conducting exploration activities within the area does vary by alternative and will, therefore, affect the potential for discovering and/or developing any unknown mineral resources of the area. This relative variation between alternatives is depicted on the following table.

Consequences on Mineral Resources

Restrictive Nature of Management Prescriptions	Acres Restricted by Management Prescriptions Alternative									
	A	B	C <i>Preferred</i>	D	E	F	G	H	I	J
Withdrawn from Mineral Entry (valid existing rights will be determined and recognized)	0	530	0	530	530	530	530	0	0	530
Highly Restrictive	975	657	4,685	657	6,381	6,021	657	975	4,685	647
Moderately Restrictive	5,046	445	2,226	445	0	360	5,724	5,046	2,226	3,370
Relatively Few Restrictions	890	5,279	0	5,279	0	0	0	890	0	2,354

11. Roads

The miles of local roads shown below for each alternative are those that are expected to be constructed to permit timber harvest. They are included in the totals for the various alternatives shown in Chapter IV of the DEIS. It is assumed that the bulk of these roads will be constructed within the next 20 years. An analysis of the road development in unroaded areas during the past ten years indicates that for every acre harvested approximately 5.5 acres are accessed. It is assumed that 50 percent of these roads will be closed to public traffic, and that the remainder will be suitable for travel by high clearance vehicles only.

These mileages are estimates based upon typical road densities necessary to harvest timber on different slope classes. The actual road miles that will result from the implementation of the various alternatives will be determined during project planning, design, and environmental analysis. The assumptions made for this analysis will be monitored. The construction of any road will be subject to the appropriate environmental analysis. That analysis will address the effects on resources that are dependent upon a roadless setting, including any adjacent roadless area or wilderness. The decision to close any road will be made on a case by case basis, according to the Forest Road Closure Policy found in the Forest-Wide Standards and Guidelines.

	<u>Alternative</u>									
	A	B	C	D	E	F	G	H	I	J
			Preferred							
Miles	16	7	4	7	0	0	7	16	4	7

12. Fire

The fire management workload generated in the Naneum roadless area as a result of the alternatives will not have a significant effect beyond the effects already described in Chapter IV.

A slight increase in risk of recreation related fires would occur in Alternatives E and F. Additional road access due to increased timber harvest activity would also increase risk of fire in Alternatives A, B, C, D, H, and I. The cost efficiency of fire suppression activities would be slightly increased in Alternatives A, B, C, D, H, and I as road access would allow more area to be covered by ground based suppression resources. Cost efficiency levels in Alternatives E and F would be less due to slower initial attack by ground forces or the use of more expensive aerial delivered resources such as helitack or smokejumpers.

The impacts generated by slash disposal activities are discussed in Chapter IV.

13. Social/Economic

To measure this area in terms of its social value, a basic assumption is being made. This is, that because of the expressed interest in keeping as much of the inventoried roadless areas as possible in an unroaded condition, the more that condition is reflected, the higher the social value.

This condition is reflected for each alternative in the summary chart under item 1, Recreation, at the beginning of this section (Section V), which indicates the acres of unroaded management.

Also, as there is varying opinion as to the mode of transportation allowed, each individual must judge for themselves which alternative best meets that aspect of the social setting. There is also a summary table reflecting this condition for each alternative as referenced above which indicates the amount of motorized versus non-motorized use within the unroaded allocation.

A general measure of timber oriented economic impacts can be made using the same table referenced above showing the amount of unroaded allocation. The larger the unroaded area, the greater the impact on timber oriented jobs. If all of the estimated long-term sustained yield per year for this area were available, it would support 13.4 jobs.

14. Wilderness Potential

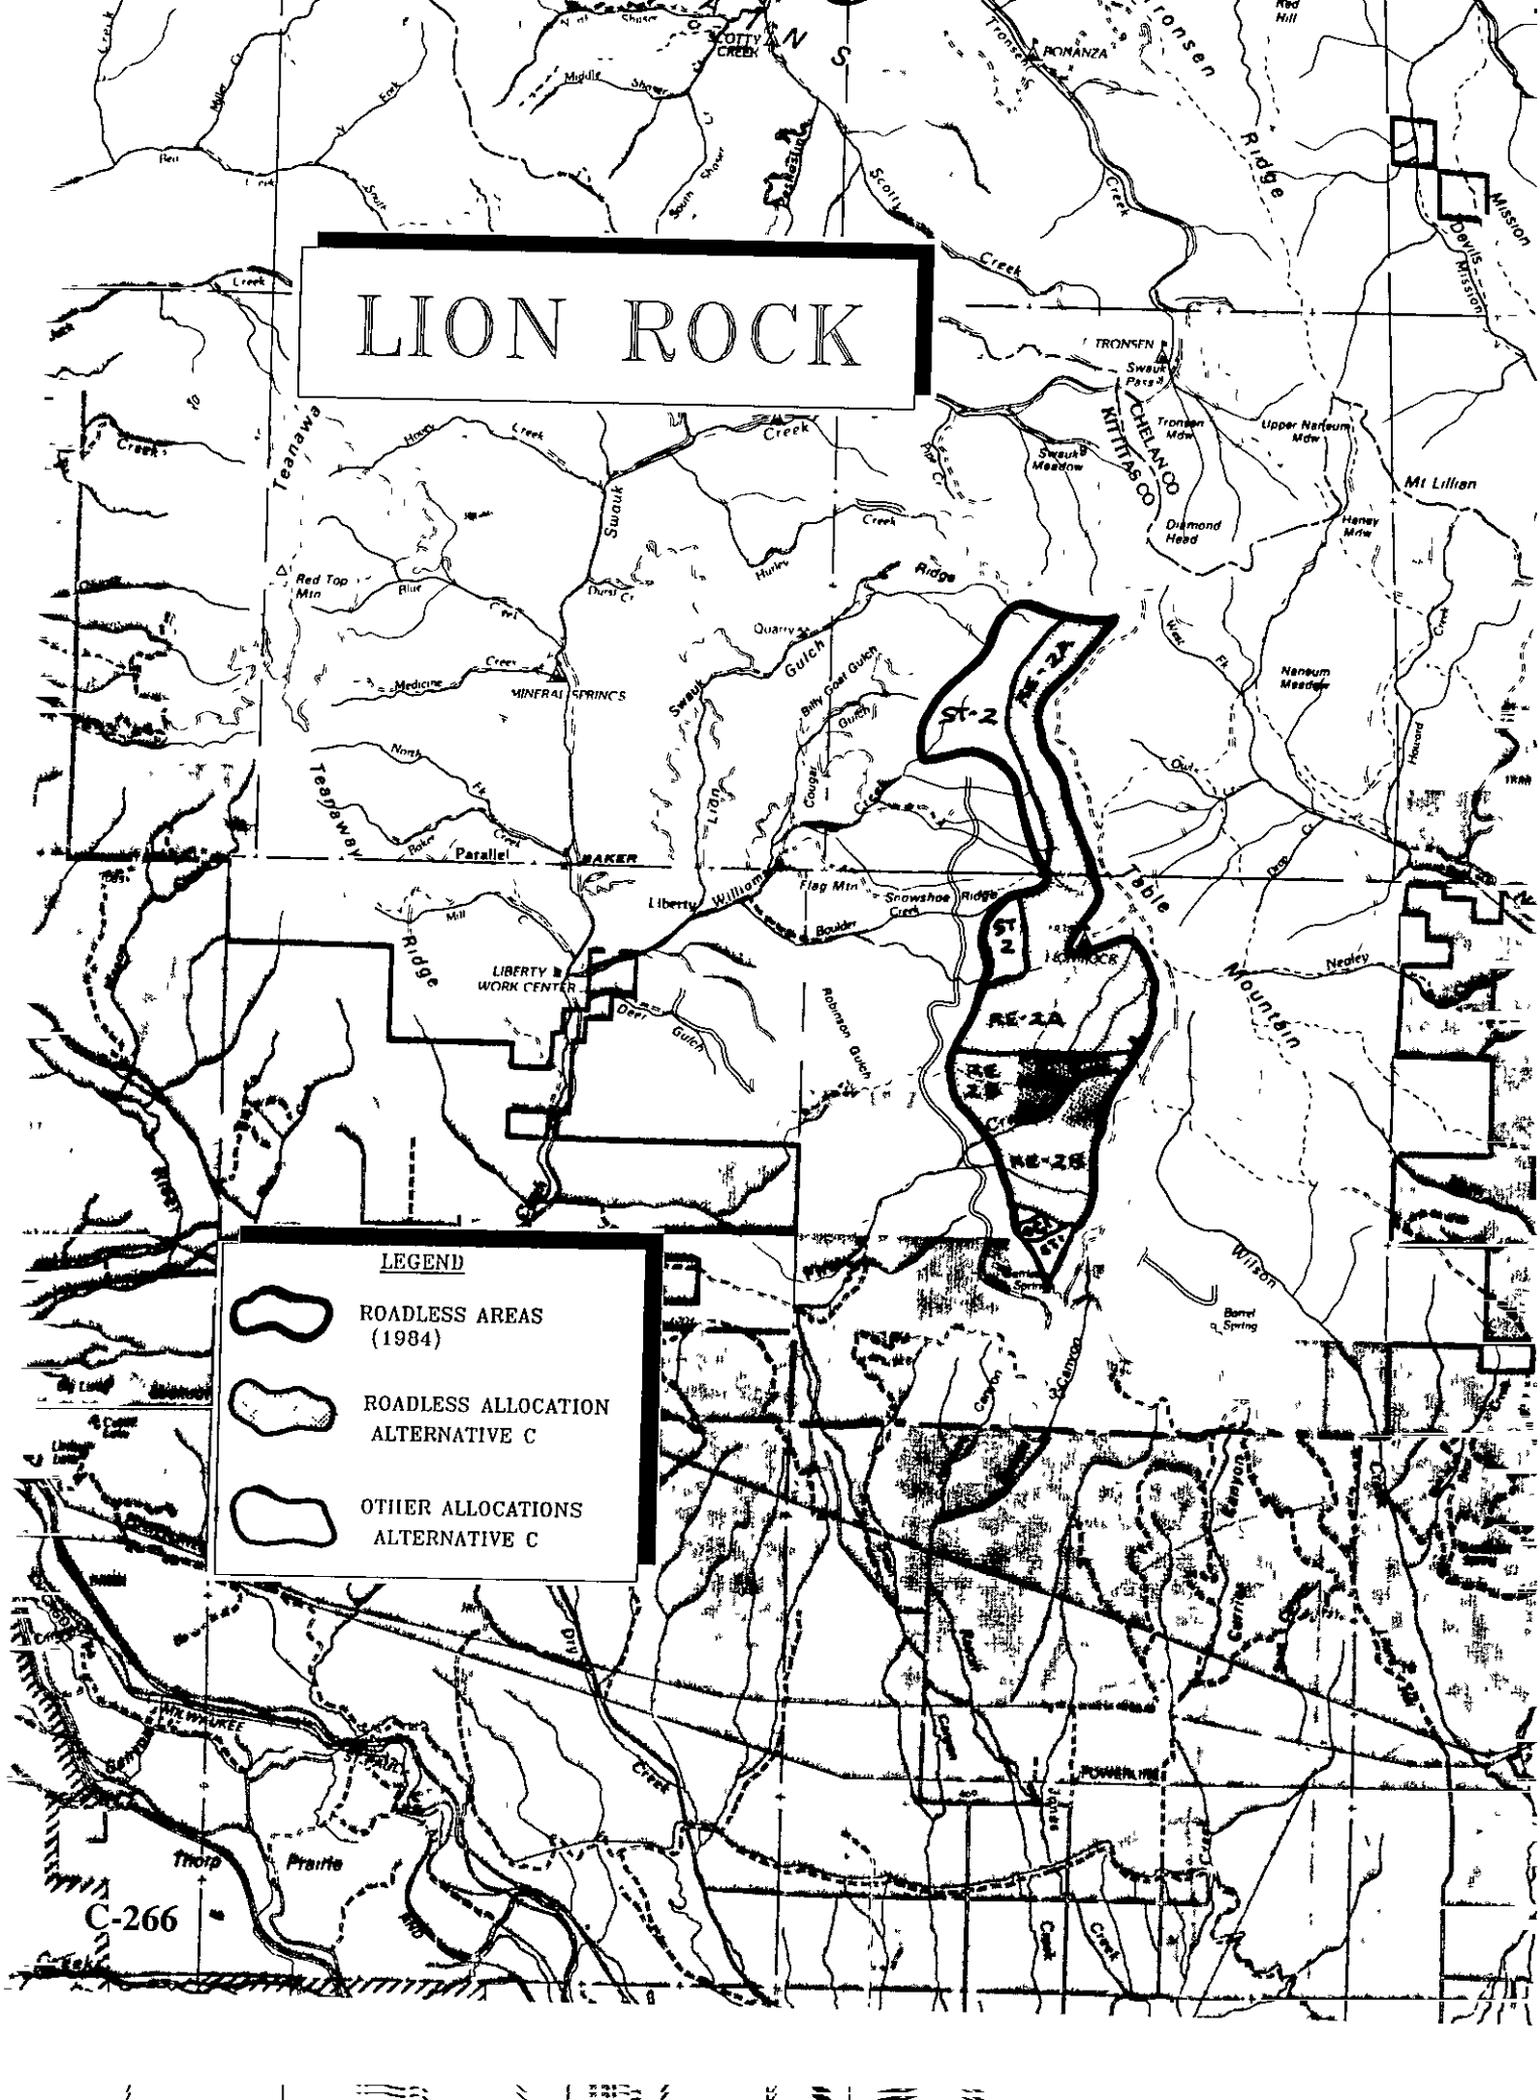

This roadless area has very limited potential for wilderness designation. The area has wilderness attributes but is small in size, only 6,911 acres. Alternatives A, B, D, G, H and J allocate very small acreage to unroaded prescriptions (1 to 8 percent). Alternatives B, D, and J allocate large portions to intensive range management. Under this emphasis, there would be extensive development of range improvements. Vegetation manipulation by livestock would be visible and apparent to recreation visitors. Reduction of the natural conditions would be moderate. Only Alternatives A and H allocate acres to General Forest and at 890 acres would not affect a large portion of the area. Alternatives C and I allocate 67 percent of the area to unroaded prescriptions with most of the acreage in unroaded big game habitat. Alternatives E and F would retain the entire area in unroaded, natural condition.

LION ROCK

LEGEND

-  ROADLESS AREAS (1984)
-  ROADLESS ALLOCATION ALTERNATIVE C
-  OTHER ALLOCATIONS ALTERNATIVE C

C-266

LION ROCK ROADLESS AREA

Size: Gross Acres: 5,470

Net Acres: 4,834

I. GENERAL INFORMATION

A. History

The area was inventoried and evaluated under RARE II as Area No. 6038 and was not recommended for wilderness. The area was not analyzed and considered as part of the Washington State Wilderness Act of 1984 process. Due to its limited size, the area was not classed as roadless during the initial stages of the current Forest Planning efforts. It is being re-addressed because interest for its unroaded character has recently been expressed.

B. Location

The area is located in Kittitas County on the Cle Elum Ranger District and is accessed primarily by the Table Mountain and Crystal Roads.

C. Physiography and Soils

This area follows along the western edge of the Table Mountain plateau. The tall basalt cliffs along this edge, along with the massive talus slopes below, are very striking and distinctive. Below the talus zone, the topography is undulating, but with an overall tilt towards the west. There are sag ponds and wet areas scattered throughout the area.

Elevations range from 3,300 to 6,000 feet. More than 90 percent of the soils have formed in basaltic material, and the remainder have formed in alluvium or else either pyroclastic or sandstone materials. Most of the area lies above 5,000 feet in elevation on a high plateau. The basaltic soils are mostly medium textured, and they often become slippery and sticky when wet. Soil depths for these soils range from about 20 inches to about 40 inches. Slopes on the top of the plateau range from about 3 to 115 percent.

D. Climate

This roadless area has a relatively narrow rainfall zone that ranges from 20-25 inches annually. The area is drier than the Naneum area with less snowfall. The estimated mean annual snow depth averages 25 inches.

E. Vegetation

Approximately 30 percent of this area is tentatively suitable forest land. Most of the area is classified as wet ecotype with Douglas-fir, grand fir, western larch, and ponderosa pine at lower elevations. At higher elevations, especially on flat benches, lodgepole pine is the predominate species.

Numerous wet areas and dry rocky areas support willow, ocean spray, serviceberry, and false hellebore.

Numerous wet areas and dry rocky areas support willow, ocean spray, serviceberry, and false hellebore. There are 1,590 acres of unsuitable forest land timber mapped in this area along the edge of Table Mountain. Large basalt rock flows are interspersed with alpine fir, western larch, and Douglas-fir timber stringers and pockets.

F. Current Uses

The current use is for dispersed recreation. The major activities and their estimated annual use are as follows:

<u>Activity</u>	<u>Estimated Annual Recreation Visitor Days</u>
Motorized Trail Riding	200
Hunting	1,000
Total	1,200

The area contains the following kinds and amounts of Recreation Opportunity Spectrum (ROS) Classes:

<u>ROS Class</u>	<u>Acres</u>
Semi-Primitive Motorized	4,834

There are 6.2 miles of trail within the area with all open to motorized use.

G. Appearance and Surroundings

The area has very high visual variety in landforms and rockforms, moderate to high vegetative variety, and low variety in waterforms (lakes and streams).

The area is dominated by steep talus basalt flows bisected with stringers of vegetation. A mixture of conifers and fall colors occur throughout the upper edges of the basalt flow.

The area is primarily foreground and middleground when viewed from the highly visible Table Mountain Road and the dispersed recreation areas along the scarp of the basalt flow.

The Lion Rock area is bounded by Table Mountain to the east and the upper reaches of First Creek, Boulder Creek, Cougar Gulch and ridges to the west, the upper Swauk Creek to the north and Garrison Springs to the south.

H. Attractions

The area is dotted with basalt features with various cliffs, formations, and talus slopes. The more prominent of these are Table Mountain to the east and Lion Rock itself.

II. CAPABILITY-WILDERNESS CHARACTERISTICS

A. Manageability and Boundaries

The Lion Rock roadless area is bordered on the east by the Table Mountain Road #3500, on the south and west by the Crystal Road, and on the north by the Liberty-Beehive Road #9712. The Table Mountain Road follows prominent geographic features on top and is easy to locate on the ground. The remainder of the roads bordering the area are used for timber access in a meandering fashion. A small portion of the boundary, the northwest corner between Crystal Road and Road 9712, follows contour lines and the head waters of Williams Creek. This relatively short section of boundary is somewhat difficult to locate on the ground.

The roads bordering this area are a mixture of single lane paved, single lane gravel, and unimproved native material roads. As a result, the types of use and speed of travel vary widely along the area boundary.

B. Natural Integrity

The area is long and slender and nearly encircled by roads. As a result, access is readily available to all portions of the area. Trails #1374, 1368, 1224, and a 4X4 road dissect the area, leaving no point further than three-fourths of a mile from a road or trail. There are both rock pits and gold mines within the boundary of this area.

C. Natural Appearance

The area itself is natural appearing. There are many vantage points along the boundary and from within the area where management activities are visible in the middle ground or background, thus limiting the sense of isolation of this area to the visitor. There is approximately one mile of fence within the area

D. Opportunities for Solitude

The Lion Rock area provides somewhat limited opportunities for solitude because of the close proximity to trails and roads. The sights and sounds of human activities are common adjacent to and from within this area. The trails are used by horsemen, hikers, and motorcyclists. All of the area is grazed by sheep or cattle.

E. Opportunities for Primitive Recreation

The opportunities for primitive recreation are moderately low. There are few challenges and little diversity for the pedestrian user. Distance from the perimeter is short.

F. Challenging Experiences

There are many cliffs in the north and east portions of the area, with opportunities existing here for climbers. The remainder of the area does not provide significant opportunity for the visitor to practice self-reliance or develop wilderness skills.

G. Special Wildlife Features

There have been sightings of peregrine falcon reported but no nesting sites have been located. No other threatened or endangered species have been located in the area. The extent of use in the area by sensitive species is unknown.

H. Historical and Scientific Study

There is a potential opportunity for outdoor education and scientific or historic studies pertaining to prehistoric subsistence patterns of the Table Mountain area.

III. RESOURCES AND POTENTIALS

A. Recreation

The area has potential value for unroaded types of recreation activities.

Estimated carrying capacity by ROS class is as follows:

<u>ROS Class</u>	<u>Capacity in Potential Recreation Visitor Days Per Year</u>
SPM	4,800

B. Wildlife

The area contains mule deer and elk summer habitat and supports a variety of small animals and birds including grouse.

C. Fish

Only First Creek is in this roadless area. This very small creek is probably used by a minor number of native cutthroat trout. Below the roadless area, the creek is occasionally dewatered by an irrigation diversion.

D. Water

There are no water related encumbrances or planned projects within the area.

E. Livestock

This small roadless area lays entirely within two domestic stock allotments. The north half is in the Table Mountain Sheep Allotment while the south half is part of the First Creek Cattle Allotment. All grazing resource potential for this roadless area is currently being managed through existing allotment plans.

F. Timber

The area contains 1,140 acres of tentatively suitable forest land. Stand, volume, and other data are as follows:

Ecotype	Stand Size	Acres	Estimated Standing Volume (MMBF)	(MMCF)
Wet	Mature	551	15.6	2.9
Wet	Immature	551	9.9	1.8
Wet	Seedling-Sapling	148	---	---
Dry	Mature	21	---	---
Dry	Immature	169	1.7	.3
	Total	1,440	27.2	5.0

The estimated maximum biological potential contribution to the long-term sustained yield is 0.50 MMBF (0.09 MMCF) per year.

G. Minerals

This area lies along the west edge of Columbia River basalts, and is underlain by both Miocene volcanic rocks and by Tertiary and Cretaceous nonmarine sedimentary rocks. The area has not been investigated in detail by either the U.S.G.S. or U.S. Bureau of Mines, but available references indicate there are no known mineral resource occurrence of interest in the area. The entire area is classified "prospectively valuable" for oil and gas; most of the area is classified "prospectively valuable" for coal resources; and the entire area was identified as an "area of critical mineral potential" in a BLM nomination process (Bee, 1983). Based upon geology and proximity to the Liberty Mining District to the west and Wenatchee Gold Area to the east, the area does have a moderate potential for the occurrence of gold deposits.

Even though the area has no proven mineral resources of a significant nature, there appears to be interest in it. According to BLM mining claim recordation data (1/23/85) there have been 193 lode claims and 4 placer claims located within or adjacent to the area which have had assessment work recorded through 1984. The area also lies within three oil and gas leases, however, there appears to be no interest in the potential coal resources of the area. Since the area has not been explored, it is not known if the claim-staking and leasing has been done in speculative response to mining and exploration conducted elsewhere or done in response to a knowledge of the area.

H. Cultural-Historical

This Unit encompasses an area of reported prehistoric use (travelways and food gathering) as well as recorded archaeological occurrences. The Lion Rock unit is also adjacent to and includes the eastern fringes of the former Swauk Mining District, some features of which are eligible for inclusion in the National Register of Historic Places.

I. Land Use

There are no special land uses within the area.

J. Fire

Annual fire occurrence is low with fuel loadings ranging from areas of heavy accumulations of ground fuels to clean stands of lodgepole pine and scattered alpine and sage meadow. Fire history consists of periodic fires of from 1 to 20 acres in size.

K. Insects and Disease

This area experienced heavy budworm defoliation in the grand fir/Douglas-fir stands in the 1970's. Mistletoe and phellinus root rot are also severe in these species. Up to 30 percent of the trees are dead as the result of these 3 damaging agents in the old growth grand fir/Douglas-fir stands. New sales in the area will emphasize clearcutting to eliminate heavy disease and insect losses in this area.

L. Private Lands

There are 636 acres of State lands within the area which are accessed by foot. Acquisition possibility is considered excellent.

IV. NEED

A. Nearby Wilderness and Other Roadless Areas

This area is located within 10 to 15 miles of the southeastern boundary of the 393,360 acre Alpine Lakes Wilderness Area and southwest and west of the Mission Creek and Naneum roadless areas respectively.

B. Distance from Population Centers

The area is reachable within two to four hours driving time from population centers such as Seattle-Tacoma, Yakima, Tri-Cities, and Wenatchee.

C. Need for Ecosystem Representation

There are no special or unique ecosystems within the area in need of representation through wilderness classification.

D. Interest by Proponents, Including Congressional

Since the passage of the Washington State Wilderness Act of 1984, there has been no expressed interest for wilderness classification of this area by proponents or Congressional factions.

However, there has been interest expressed by environmental and off-road vehicle users to maintain roadless status for the area.

E. Public Input

Public input during the RARE II and other planning efforts was obtained and supported unroaded allocations. Of 763 responses, results were 84 percent for non-wilderness, 3 percent for further planning, and 13 percent for wilderness.

F. Other Public Involvement

Public input solicited during the formulation of alternatives for this plan indicated much support for dispersed, unroaded recreation use for the area. Opinion differs as to whether the allocation should be for motorized or nonmotorized use.

V. ENVIRONMENTAL CONSEQUENCES

A. Environmental Consequences Associated with the Alternatives

1. Recreation

a. Significant Effects

The Lion Rock roadless area consists of 4,834 acres on the west side of Table Mountain in Kittitas County. The entire area was inventoried according to the Recreation Opportunity Spectrum (ROS) as Semi-Primitive Motorized. Due to the area's small size, the allocations do not vary significantly from one alternative to another, except for A and H which do not allocate any portion of the area to recreation use. In these alternatives, natural appearance would be altered by harvest activities. In the remaining 7 alternatives, the allocation to motorized dispersed recreation ranges from 70 to 100 percent.

Under Alternatives C and I, the portion of the trail system in this roadless area is allocated as follows:

Trail Name	Trail Number	Unroaded Non-Motorized	Unroaded Motorized	Roaded Motorized
Ridge	1352	--	2.0	--
First Creek	1374	--	--	4.2
Totals		--	2.0	4.2

b. Summary

The following tables indicate, by alternative, the degree to which this area will be allocated to roadless management and, of the roadless management acres, what percent is motorized and non-motorized. (These represent the Semiprimitive Motorized and Semiprimitive Non-Motorized Recreation Opportunity Spectrum (ROS) Classes. The area being allocated to roaded types of management activities will become Roaded Natural or Roaded Modified ROS opportunities depending on the intensity of development.)

Percent of the Area Having Unroaded Allocation

Alternative	A	B	C	D	E	F	G	H	I	J
	0	80	74	80	100	94	94	0	74	80

Percent of the Unroaded Allocation Area
In Terms of Motorized/Non-Motorized Recreation

Alternative	A	B	C	D	E	F	G	H	I	J
	0/0	100/0	100/0	100/0	94/6	100/0	100/0	0/0	100/0	100/0

The area being allocated to roaded management activities will have increased dispersed roaded recreation opportunities and the possible opening of access to potential developed recreation sites. The trail miles within the area allocated to roading may provide a less semi-primitive recreation experience with a more roaded natural or roaded modified setting.

2. Wild, Scenic, and Recreational Rivers

There are none associated with this roadless area.

3. Cultural Resources

Consideration of cultural resource values are required by a special set of historic preservation laws, regulations and policies. Particular efforts will be made in every alternative to inventory, evaluate, and provide for significant cultural resources in areas where Forest management activities are planned.

4. Scenery

Alternatives A and H will allocate most of the land to Partial Retention VQO. The middleground view from the Table Mountain travel route will be slightly altered. A majority of the area is steep talus rocks and slides with high scenic value.

Alternatives B, D and J will allocate the highly scenic talus rocks and slides to Retention VQO. Most areas just outside of the area will be allocated to Maximum Modification. Table Mountain viewshed will be slightly altered.

Alternatives C and I will allocate most of the talus rocks and slides to Retention VQO. The majority of the area will have high scenic quality. Some areas along the lower elevations will be allocated to Maximum Modification. Table Mountain viewshed will be slightly altered to natural appearing.

Alternative E will allocate all the scenic rocks and slides and adjacent timbered land to Retention VQO. Scenic quality will be preserved.

Alternative F will be allocated to Retention to Partial Retention VQO. Scenic quality will be very high. Table Mountain viewshed will retain its scenic qualities.

Alternative G is the same as Alternative F. Natural landscape will dominate the area. Scenic qualities will be retained as viewed from Table Mountain viewshed.

The following table summarizes the Scenic component of this area by alternative in acres of Visual Quality Objective (VQO).

VQO	Alternative									
	A	B	C	D	E	F	G	H	I	J
Preservation	--	--	--	--	--	--	--	--	--	--
Retention	742	3,923	3,794	3,923	4,834	4,664	4,685	742	3,974	3,923
Partial Retention	3,477	21	1,040	21	--	170	149	3,477	1,040	21
Modification	509	21	--	21	--	--	--	509	--	21
Maximum Modification	106	869	--	869	--	--	--	106	--	869
Total Acres	4,834	4,834	4,834	4,834	4,834	4,834	4,834	4,834	4,834	4,834

Preservation indicates that only natural, ecological changes will occur.

Retention indicates an essentially natural appearing landscape will be present.

Partial Retention indicates the landscape will be slightly altered.

Modification indicates a moderately altered landscape will be present.

Maximum Modification indicates a heavily altered landscape may be present.

5. Wildlife

Alternatives A and H would road all of the area but allow for timber harvest emphasis on only two percent of the area. Alternatives B, D and J would road 20 percent of the area and allow for timber harvest emphasis on 18 percent of the area. Alternatives B, D and J would also allow for development of off-road vehicle use on 80 percent of the area. The overall effect of the four alternatives mentioned above on wildlife resource in this area are similar. Alternatives C and I would also have effects on wildlife habitat that are similar to A, B, D, H and J. Alternative E would have minimal impact on wildlife resources in this area. Alternatives F and G would have somewhat more impact than E but less than the other alternatives.

6. Fisheries

a. Significant Effects

There is only one creek in this roadless area, First Creek, and it has very low numbers of native cutthroat trout. In Alternatives B, C, D, E, F, G, I and J the area would remain roadless. In Alternatives A and H, the lower one-half mile of the stream vicinity would be managed using primarily extended shelterwood timber harvest methods to maintain the visual objectives of the area. The upper one-half mile of stream area would be managed to produce maximum appropriate forage for big game.

In the alternatives that would road the area near the creek, it is unlikely that there would be any significant effects on the stream since only a one mile reach would be affected.

b. Mitigation Measures

In the alternatives that could road the First Creek area, the riparian protection zone prescription, the Wenatchee National Forest's Best Management Practices (September 1980 and revised October 1982), and all standards and guidelines common throughout riparian areas of the Forest would be applied to protect any fisheries value discovered during project planning.

If the areas are roaded, road closures could be implemented to reduce the impact of enhanced access on the native fish populations.

7a. Vegetation: Trees

Under all alternatives it is expected that more area will remain unroaded than is roaded. The range of tree management activities is from 869 acres (18 percent) scheduled for timber emphasis in Alternatives B, D and J, to no scheduled harvest in Alternative E.

Alternatives A and H have 106 acres (2 percent) timber emphasis and an additional 4,474 acres of vegetation manipulation with other resource emphasis planned. However, much of this area is rocky, unsuitable forest area and would not be logged under any of the alternatives.

Alternatives C and I have identical acre allocations. Both have 1,210 acres which would be managed for other resource values that permit vegetative manipulation through timber sales. The primary difference between Alternatives C and I is the rate of harvest. Under Alternative I, more harvest activity would be scheduled in the first decade.

Alternatives F and G do not allocate any acres to timber emphasis. However, they do anticipate vegetative manipulation through timber sales on 275 acres or 6 percent of the area.

7b. Vegetation: Forage

The potential for production and utilization of forage in this small roadless area is currently being realized. The area is within portions of two existing livestock allotments and the roadless nature has no significant effect on the forage base. There is no difference in alternatives as to effects they have on the vegetative environment due to size of the area and vegetation types occurring in the area.

8. Soil and Water

a. Significant Effects

The environmental consequences of allocating the Lion Rock area to General Forest or Roadless Management are discussed by alternative below. No significant soil and water consequences are associated with Alternatives C, E, F, G and I because soil and water disturbing activities occurring would be minimal. Alternatives B, D and J could allocate up to 20 percent, and Alternatives A and H could allocate up to 100 percent of the area to timber harvest and road building. The environmental effects of timber harvest, road building, and livestock grazing on soil and water are discussed in Chapter IV - Soil and Water sections.

The risk of degrading the soil and water resource increases with more timber harvest and road building activity. Alternatives A and H pose more risk of degrading the soil and water resource than Alternatives B, C, D, F, G, and I due to more intensive management. However, since Wenatchee National Forest Best Management Practices (1982) and Forest Plan Standards and Guidelines will be employed, no unique soil and water effects are expected to occur because of forest management in this area.

b. Mitigation Measures

The mitigation measures that will be used in this area are the same as those discussed in Chapter IV - Soil and Water sections.

9. Air

There will be little additional prescribed burning generated in the Lion Rock roadless area as a result of the alternatives. This would not have significant effects on air quality beyond those discussed in Chapter IV.

10. Minerals

As the previous discussion indicates, the area is encumbered by 193 lode claims, 4 placer claims, and 3 oil and gas leases. Even though it has no known mineral resource occurrences, it is considered to have potential for the occurrence of gold, coal, and oil and gas, and it has been identified as an area of critical mineral potential. Since none of the alternatives call for withdrawing any part of the area from mineral entry, the consequences on mineral resources do not appear to be extremely significant nor do they vary appreciably by alternative. However, the management prescriptions under which the area would be managed in each alternative would restrict mineral activities to varying degrees (i.e., special stipulations in leases and in approved operating plans). The effects of these restrictions cannot be quantified, but the negative influence they would have on interest in conducting exploration activities within the area does vary by alternative and will, therefore, affect the potential for discovering and/or developing any unknown mineral resources of the area. This relative variation between alternatives is depicted on the following table.

Consequences on Mineral Resources

Restrictive Nature of Management Prescriptions	Acres Restricted by Management Prescriptions									
	A/NFMA	B	C Preferred	D	E	F	G	H	I	J
Withdrawn from Mineral Entry (valid existing rights will be determined and recognized)	0	0	0	0	0	0	0	0	0	0
Highly Restrictive	360	3,944	3,688	3,944	4,834	4,558	4,579	360	3,688	3,944
Moderately Restrictive	4,368	0	1,146	0	0	276	255	4,368	1,146	1,526
Relatively Few Restrictions	106	890	0	890	0	0	0	106	0	890

11. Roads

The miles of local roads shown below for each alternative are those that are expected to be constructed to permit timber harvest. They are included in the totals for the various alternatives shown in Chapter IV of the FEIS. It is assumed that the bulk of these roads will be constructed within the next 20 years. An analysis of the road development in unroaded areas during the past ten years indicates that for every acre harvested approximately 5.5 acres are accessed. It is assumed that 50 percent of these roads will be closed to public traffic, and that the remainder will be suitable for travel by high clearance vehicles only.

These mileages are estimates based upon typical road densities necessary to harvest timber on different slope classes. The actual road miles that will result from the implementation of the various alternatives will be determined during project planning, design, and environmental analysis. The assumptions made for this analysis will be monitored. The construction of any road will be subject to the appropriate environmental analysis. That analysis will address the effects on resources that are dependent upon a roadless setting, including any adjacent roadless area or wilderness. The decision to close any road will be made on a case by case basis, according to the Forest Road Closure Policy found in the Forest-wide Standards and Guidelines.

	<u>Alternative</u>									
	A/NFMA	B	C Preferred	D	E	F	G	H	I	J
Miles	6	3	1	3	0	0	0	6	1	3

12. Fire

The fire management workload generated in the Lion Rock roadless area as a result of the alternatives will not have a significant effect beyond the effects already described in Chapter IV.

13. Social/Economic

To measure this area in terms of its social value, a basic assumption is being made. This is, that because of the expressed interest in keeping as much of the inventoried roadless areas as possible in an unroaded condition, the more that condition is reflected, the higher the social value.

This condition is reflected for each alternative in the summary chart under item 1, Recreation, at the beginning of this section (Section V), which indicates the acres of unroaded management.

Also, as there is varying opinion as to the mode of transportation allowed, each individual must judge for themselves which alternative best meets that aspect of the social setting. There is also a summary table reflecting this condition for each alternative as referenced above which indicates the amount of motorized versus non-motorized use within the unroaded allocation.

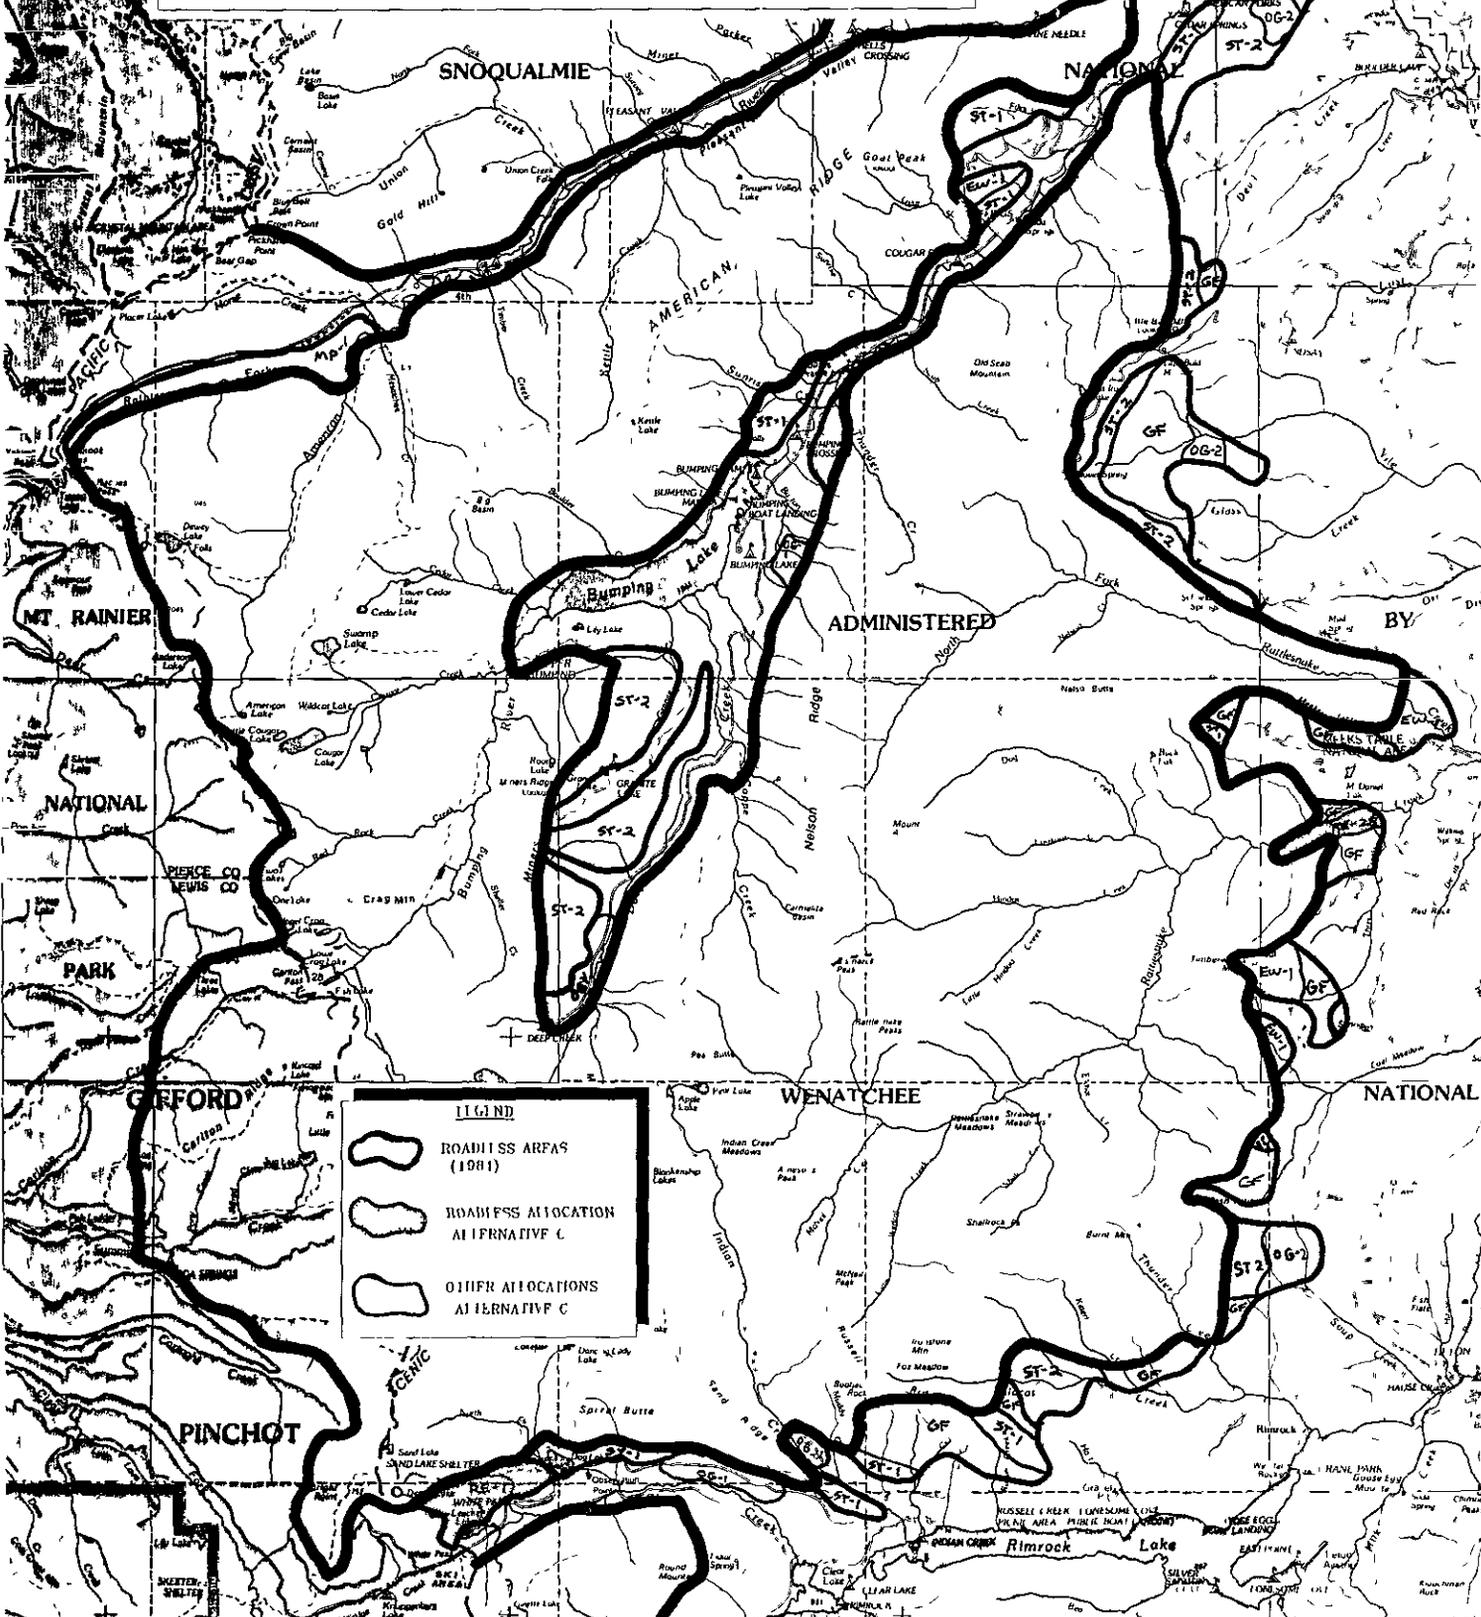

A general measure of timber oriented economic impacts can be made using the same table referenced above showing the amount of unroaded allocation. The larger the unroaded area, the greater the impact on timber oriented jobs. If all of the estimated long-term sustained yield per year for this area were available, it would support 6.0 jobs.

14. Wilderness Potential

This unroaded area has high recreation value as an unroaded area but at 4,834 acres in size and isolated from existing wilderness, it has little potential for wilderness.

Alternatives A and H retain no unroaded acres. Alternatives B, D, J, C, and I retain 71 to 80 percent of the area as unroaded. Alternatives E, F, and G retain almost all of the area as unroaded. Alternatives B, D, and J prescribe 869 acres to General Forest. All other alternatives emphasize a balance of resource values with no General Forest. Wilderness characteristics will receive a high level of retention in all alternatives except B, D, and J.

WILLIAM O. DOUGLAS ADJACENT

LEGEND

-  ROADLESS AREAS (1981)
-  ROADLESS ALLOCATION ALTERNATIVE C
-  OTHER ALLOCATIONS ALTERNATIVE C

WILLIAM O. DOUGLAS ADJACENT ROADLESS AREA

Size: Gross Acres: 22,938

Net Acres: 22,938

I. GENERAL INFORMATION

A. History

This is adjacent to an area that has historically been advocated for wilderness. The original area was studied under RARE II as D6032 which was peripheral to the Cougar Lakes wilderness proposal areas. It was not recommended for wilderness. The entire area was inventoried as roadless in the fall of 1983. It consisted of the old RARE II areas C, D, and E6032 and was called Cougar Lakes. It was these three areas that were involved in various wilderness proposals including RARE II, Pritchard-Lowery, and President Carter. The majority of the area (146,451 acres) became wilderness under the Washington State Wilderness Act of 1984. The area was renamed William O. Douglas in honor of the late Supreme Court Justice who roamed the area throughout his life.

B. Location and Access

The remaining roadless area is made up of small parcels scattered along the new William O. Douglas Wilderness boundary and are accessed via Highways 410 and 12 and the Bethel Ridge, Bumping, and Nile Loop roads.

C. Physiography and Soils

The topography ranges from gentle to steep; the slopes are mostly convex and uniform. These units are small and scattered, but none are particularly striking. Generally, these units all lie on the lower slope positions.

Elevations range from 3,300 to 6,200 feet. About 50 percent of the soils have developed in basaltic materials, 20 percent in pyroclastic materials, 15 percent in granitic materials, 10 percent in glacial till, and the balance in alluvial materials. The basaltic and the pyroclastic materials tend to become slippery and sticky when wet and are easily compacted when moist. The granitic, glacial till, and alluvial materials, on the other hand, are usually not slippery or sticky when wet. These materials will also compact, but not as easily. Soil depths generally range from 20 to about 40 inches; however, the alluvial soils are often more than 60 inches deep.

D. Climate

The roadless area(s) lies in an approximate 45-90 inch precipitation zone. It experiences an average snow depth of nearly 136 inches annually with an estimated 56 inches of water equivalent.

E. Vegetation

As this area includes scattered parcels all along the east side of the William O. Douglas Wilderness, vegetation is variable. Areas near the crest, such as the White Pass-Dog Lake area, are climax mountain hemlock, Pacific silver fir, alpine fir and Alaskan yellow cedar. The other extreme in vegetation is the low elevation, dry, rocky, river bottom area below the confluence of the Bumping and American Rivers. This area is open ponderosa pine, Douglas-fir with an understory of pine grass, and pine mat, ceanothus, and Kinnikinnick. Tentatively suitable forest land occupies 62 percent of these scattered parcels.

F. Current Uses

The current use is for dispersed recreation. The major activities and their estimated annual use are as follows:

<u>Activity</u>	<u>Estimated Annual Recreation Visitor Days</u>
Hunting	6,000
Motorized Trail Riding	1,000

The area contains the following kinds and amounts of Recreation Opportunity Spectrum (ROS) Classes:

<u>ROS Class</u>	<u>Acres</u>
Semi-Primitive Non Motorized (SPNM)	10,980
Semi-Primitive Motorized (SPM)	11,958
Total	22,938

There are 17.7 miles of trail within the area of which 3.8 miles are not currently open to motorized use

G. Appearance and Surroundings

This area has moderate visual variety of landform, vegetation, rockform and waterforms (lakes and streams).

The area is a highly textured hillside, with a variety of vegetative patterns. The patterns are created by a large variety of species of mixed conifers, dense drainage bottoms, rocky ridges with some basalt rocks, and rock formations along the ridgetops of side drainages.

The area is primarily viewed as foreground and middleground from trails that lead into the William O. Douglas Wilderness; the Bumping Road, Mather Memorial Parkway (Hwy 410), Little Bald Mountain, White Pass (Hwy. 12), and other Forest roads.

The Cougar Lakes portion is bounded by the William O. Douglas Wilderness to the west, and a narrow area on the upper end of the drainage adjacent to the William O. Douglas Wilderness to the east. These roadless areas are narrow fringes of the unroaded areas adjacent to the William O. Douglas Wilderness.

H. Attractions

Main features are Dog and Granite Lake, North and South Fork of Rattlesnake Creek, and Indian Creek.

II. CAPABILITY-WILDERNESS CHARACTERISTICS

A. Manageability and Boundaries

The many segments of the William O. Douglas Adjacent roadless area border the William O. Douglas Wilderness. Only the Devil's Rim segment offers a good opportunity to be managed as a roadless area. This unit has well defined boundaries and is isolated from man's activities. Most of the other segments are bordered by forest roads and timber harvest units and would be difficult to map and find on the ground. Obviously this is one of the reasons they were excluded from the classified wilderness.

The segments referred to as the Rainier Fork of the American River and part of the Devil's Rim within the Mather Memorial Parkway are managed for their recreation and scenic resources.

As these areas are scattered and diverse in some aspects, the natural integrity and natural appearing characteristics are being addressed by each small area.

B. Natural Integrity

Much of the William O. Douglas Adjacent roadless area outside of the William O. Douglas Wilderness are protrusions paralleled by forest roads and harvest units, and were excluded from the Washington State Wilderness Act of 1984. There are segments that have motorized trails specifically mentioned in the Act that would remain open to the usage and enjoyment of motorized visitors. This would indicate that some of the segments would no longer be considered as roadless non-motorized or future wilderness. Some of the protrusions are very scenic and would make desirable roadless areas.

Rainier Fork of the American River. There has been little impact of human activity in this segment except a very primitive mine-to-market road which is used occasionally by motorized vehicles. State Highway 410 is very visible on the north side of this segment and is very apparent from the entire roadless segment.

Chipmunk Creek Drainage. This area is adjacent to a forest road and timber harvest units. Most of the roadless area views the activities of man; however, a small portion of this segment above Soda Springs Campground has scenic rugged cliffs used regularly by mountain goats.

Miners Ridge. This segment is bordered and dissected by forest roads, with man's activities viewed from much of the area. There are a number of early mining activities within these segments. Motorized vehicle travel to the many unpatented mining claims on an old mine-to-market road continues to this day.

Devil's Rim. This segment is bordered by forest roads and timber harvest units. The Little Bald Mountain Trail #961, which is in this segment, was specifically mentioned in the Act as a motorized vehicle trail. It was constructed with funds from the Interagency Commission for Outdoor Recreation. The area below Devil's Rim is unroaded and provides an island for wildlife escapement. The segment west of Thunder Creek is heavily roaded with primitive woodcutter roads, drill site holes, and an access road for the proposed Bumping Lake Dam Enlargements.

Upper Nile. This segment has four-wheel-drive routes specifically mentioned in the Washington State Wilderness Act of 1984 as places where motorized vehicle use would continue. This segment is bordered by forest roads and timber harvest units. On high points within this segment the activities of man are evident.

Meeks Table. This segment is east of Meeks Table Research Natural Area. Within this segment the activities of man can readily be seen. There is little vegetation to screen man's activities from the Forest visitor.

Rattlesnake. Part of this segment includes the Rattlesnake Four-Wheel-Drive Route where a corridor was retained for continued motorized vehicle use in the Washington State Wilderness Act of 1984. This segment is bordered by Forest roads and timber harvest units. The other part of this segment lies north of Timberwolf Mountain and is heavily modified by fire as a result of early range burning. Many of man's activities can be seen from most of this segment. Timberwolf Mountain roaded observation site and former lookout location exist on the highest point of this segment.

MJB. Most of the area adjacent to this segment was classified as wilderness. These remaining segments were considered unmanageable as wilderness. This segment is bordered by forest roads used primarily by recreationists, wood cutters, and occasional timber harvesters.

Cash Prairie - Wildcat. These segments are bordered by Forest roads and timber harvest units and there are motorized vehicle routes within it. An operating Mercury Mine in the Wildcat has primitive road access to it and continues to operate.

White Pass. This segment has a patented mining claim with road access to it and a cross country ski trail that is groomed with a motorized trail groomer. Much of the area is under special use permit to White Pass Company, Inc., for cross-country skiing. A powerline with road access is within this segment.

C. Natural Appearance

To maintain continuity the many segments of the William O. Douglas Adjacent roadless area will be referred to by area.

Rainier Fork of the American River. This segment appears to be very natural. But when looking out from the roadless area, the impact of State Highway 410 makes the visitor feel like a person is in a very unnatural and developed environment.

Chipmunk Creek Drainage. From most of this area, one views Forest roads and timber harvest units; however, a small portion of this segment overlooking Soda Springs Campground is natural appearing. These rugged cliffs frequented by mountain goats reinforces a feeling of naturalness.

Miners Ridge. This area is fragmented by road penetration and mining activity. The views into this roadless segment are fairly scenic, but Forest roads are evident to the visitor looking out from the roadless area because the area is so small. The sound of motorized vehicles on the Forest roads is audible within most of the roadless area.

Devils Rim. This segment is divided into three pieces. The area west of Thunder Creek is heavily roaded with primitive roads and appears modified by man's activities. The area north of Little Bald is exposed to roads and timber harvest units but it has some scenic alpine meadows that suggest a feeling of naturalness. The area below Devil's Rim that borders the Bumping River appears near natural.

Upper Nile. Although this area is bordered by roads and timber harvest units, the activities of man are usually seen only from high points within the roadless area. The dense vegetation adds to the naturalness of the area.

Meeks Table. There are very few places within this segment that do not allow views of man's activities. Sparse vegetation and the smallness of these segments contribute to the unnaturalness of the area.

Rattlesnake. Most of the roads and timber harvest units adjacent to this segment can be viewed from the roadless area, greatly reducing any feeling of naturalness. Timberwolf Mountain observation site offers unique views into the wilderness.

MJB. These segments of roadless area are so small that adjacent activities of man are very noticeable to the visitor inside the roadless area.

Cash Prairie - Wildcat. In the very heart of the Wildcat there is the feeling of naturalness, but much of this segment looks out towards adjacent activities of man including State Highway 12, Rimrock Reservoir, Bethel microwave tower, and many Forest roads and timber harvest units.

White Pass. This segment looks out on the White Pass Ski Area, State Highway 12, and the REA Powerline. Few places within this roadless segment appear to be natural to the forest visitor. White Pass is a popular Cascade Crest light aircraft crossing area. The sight and sound of low flying planes and helicopters is common.

D. Opportunities for Solitude

Because of the small segments of land included in the William O. Douglas Adjacent roadless area, there are few opportunities for solitude. In many cases, roads have penetrated deeply into these segments lowering the opportunity for solitude. Of the many segments, Devil's Rim, Upper Nile, and Wildcat offer some solitude opportunities. These are the largest segments and because of topography and vegetation, they can screen people from one another at short distances.

E. Opportunities for Primitive Recreation

Most of the segments of this roadless area are very small and offer few opportunities for primitive recreation except for day use, and big game hunting for elk and deer. Devil's Rim, Upper Nile, and Wildcat offer better opportunities for big game hunting, hiking, backpack camping, and scenic viewing. The Rattlesnake segment provides goat viewing at Timberwolf Mountain lookout site.

F. Challenging Experiences

Opportunities for primitive recreation and challenging experiences are limited because the many segments of the William O. Douglas Adjacent roadless area are isolated protrusions surrounded by activities of man. The dense vegetation and irregular topography of the Devil's Rim, Upper Nile, and Wildcat would offer some challenge to the inexperienced.

G. Special Wildlife Features

There have been sightings of peregrine falcon reported but no nesting sites have been located. No other species of threatened or endangered wildlife have been found in the area. Use by sensitive species is unknown.

H. Historical and Scientific Study

There are no special or unique opportunities for outdoor education, and scientific or historic study in the area, which cannot already be found in the existing wilderness on the Forest.

III. RESOURCES AND POTENTIALS

A. Recreation

The area has potential value for unroaded types of recreation activities. Estimated carrying capacity by ROS Class is as follows:

ROS Class	Capacity in Potential Recreation Visitor Days Per Year
SPM	11,000
SPNM	<u>35,800</u>
Total	46,800

B. Wildlife

Major big game species such as elk, mule and black tail deer, and black bear are found in the area, as well as mountain goat which inhabit the areas of Timberwolf Mountain, Mt. Aix, and American Ridge.

Blue grouse and ruffed grouse are among the game birds in the area.

C. Fish

This area encompasses only very small portions of a number of stream systems. Granite Creek produces substantial populations of native wild cutthroat trout and a small population of non-native Eastern brook trout.

The portions of the North and South Forks of Rattlesnake Creek within the area have some potential to be used by anadromous fish, but probably do not at this time. Downstream of their intersection, there is anadromous fish use. There are productive populations of resident trout in both forks.

Wildcat Creek has a small population of cutthroat trout.

Dog Lake has Eastern brook trout and rainbow trout which are both stocked. There are very few wilderness fishing qualities because of its vicinity to U.S. Highway 12.

D. Water

A potential impact to the William O. Douglas Adjacent areas "DD" and "DE" exist if a proposed small hydroelectric project is constructed on Rattlesnake Creek.

This roadless area currently is encumbered by an Executive Order dated 2/20/23 that designated the Rattlesnake watershed to be managed by the Forest, but protected it from potential land exchange and mining activity. The intent of President Harding's E.O. was to protect the City of Yakima's water supply. This affects all adjacent roadless area lands that are located within the E.O. designated area of the Rattlesnake drainage basin.

Recently, the City of Yakima filed a preliminary permit application with the Federal Energy Regulatory Commission to study an area within the Rattlesnake drainage contemplating construction of a small, hydroelectric project. The proposed project could affect portions of Sections 9, 10, and 11; T15N, R14E WM. Information currently available is conjectural regarding the impact that this proposal would have on the roadless area. The probability of construction is unknown at this time.

There is also a proposed watershed withdrawal by the City of Yakima dated January 20, 1964, that either affects portions of this roadless area or land immediately adjacent to them.

E. Livestock

This roadless area is now made up of 10 to 15 small roadless parcels adjacent to the William O. Douglas Wilderness. All are now within portions of various recreation and livestock allotments. The grazing potential is currently being realized as part of eight inventoried allotments, four of which are recreation and four domestic.

F. Timber

The area contains 14,140 acres of tentatively suitable forest land. Stand, volume and other data are as follows:

Ecotype	Stand Size	Acres	Estimated Standing Volume (MMBF)	(MMCF)
Wet	Mature	8,268	234.3	43.0
Wet	Immature	4,345	78.1	14.3
Wet	Seedling-Sapling	211	----	----
Dry	Mature	658	8.2	1.5
Dry	Immature	616	6.1	1.1
Dry	Seedling-Sapling	42	----	----
	Total	14,140	326.7	59.9

The estimated maximum biological potential contribution to the long-term sustained yield is 4.6 MMBF (0.8 MMCF) per year.

G. Minerals

The parcels are primarily underlain by Tertiary volcanic and by Tertiary intrusive igneous rocks of granitic composition. The area adjacent to these parcels has been investigated by the U.S.G.S. and U.S. Bureau of Mines as part of their study of the William O. Douglas Wilderness Area. As a result of their study, they only identified one area near the subject parcels which has a "probable" mineral potential. This is the Miners Ridge area lying south of Bumping Lake. The parcels do, however, lie within a north-northwest trending metallogenic province which includes the Morris Creek-American Ridge, Copper City-Deep Creek, Bumping Lake, Rattlesnake, and Wildcat-Indian Creek mineral potential areas (see Figure III-14 in the DEIS). The minerals of interest occurring within this area include copper, gold, silver, molybdenum, tungsten, mercury, and manganese.

Of much interest are those parcels lying within the Copper City-Deep Creek or Miner's Ridge area which have potential for the occurrence of tungsten, and a copper-molybdenum deposit. Those parcels lying within the other areas identified on Figure III-14, however, also have inadequately investigated potentials for similar commodities, as well as, for mercury, manganese, and iron. Based upon BLM mining claim recordation data (1/23/85), there does not appear to be a lot of interest in the subject lands. That data indicates that only nine lode claims and three placer claims have been located on the roadless area parcels, and these have been in the Bumping Lake and Rimrock Lake areas.

Most of the area has been classified "prospectively valuable" for geothermal resources, while only a small area around the headwaters of Nile Creek have been classified "prospectively valuable" for oil and gas. Interest in the areas' geothermal resource potential is indicated by eight pending applications. Even though the area has little apparent oil and gas potential, the subject lands have either been leased as part of six existing leases or are involved in one of 12 pending applications. Without the benefit of exploration results the actual potential for the development of these two commodities remains unknown.

H. Cultural-Historical

There are few known historic sites and no recorded prehistoric sites within the small, scattered parcels of the William O. Douglas Adjacent units. Historically, the area was peripheral to the developments along the Naches and Tieton River valleys to the east, as well as to the Summit and Bumping Lake Mining Districts to the west. However, the long-term use of the Cougar Lakes area for livestock grazing and fur trapping is undoubtedly represented by currently undiscovered cultural resources.

There was intensive prehistoric use of the area to the east and west of the William O. Douglas units. Major camps were established along the Naches River and its major tributaries by ancestors of the Yakima Indians. From these base camps, regular and patterned excursions were made to hunt and trap, to collect vegetable foods (roots, berries and medicinal plants), to obtain specific lithic materials, and/or to travel via the passes and divides to neighboring Indian camps and villages. There was also a great spiritual attachment to the land; prominent landform features and areas of particular aesthetic beauty or resource abundance were likely to have held a special religious significance for the American Indians. Further field examination, based on landforms and exploitable resource distributions, as well as continued cooperation with the Yakima Nation, is vital to our understanding and appreciation of the cultural significance of this area.

I. Land Use

There are no special land uses within the area.

J. Fire

Annual fire occurrence is low with most fires caused by lightning. Fuel loadings are heavy down accumulations at lower elevations, and scattered meadows and clumps of trees at higher elevations. Fire history is primarily small, isolated fires with some periodic larger fires occurring.

K. Insects and Disease

Mountain pine beetles have killed large volumes of western white pine in the Bumping and Clear Lake areas. Root rots also have killed scattered pockets of Douglas-fir and grand fir in most of the lower elevation areas. Entomologists expect the spruce budworm to spread through the Douglas-fir and grand fir dominated stands below 5,000 feet elevation.

L. Private Lands

There are no private lands within the area.

IV. NEED

A. Nearby Wilderness and Other Roadless Areas

These areas are located immediately adjacent to the 167,195 acre William O. Douglas Wilderness area.

B. Distance from Population Centers

The area is within two to four hours driving time from population centers such as Seattle-Tacoma, Yakima, Tri-Cities, and Wenatchee.

C. Need for Ecosystem Representation

There are no special or unique ecosystems within the area in need of representation through wilderness classification.

D. Interest by Proponents, Including Congressional

These scattered segments were left out of the classified wilderness because they were considered to be insignificant and/or unmanageable by the Congressional delegations. There was, and still is, some interest by interested individuals to keep the Miners Ridge, Upper Nile, and Devil's Rim segments unroaded. There is interest in the White Pass segment to expand the existing White Pass Ski Area into this roadless area for a higher density cross-country, machine packed, ski trail system.

Environmental organizations have expressed interest in adding portions of the area to the National Wilderness Preservation System in the future.

There is interest in the Miners Ridge and Wildcat segments for mining. There are several unpatented mining claims at the present time.

Off-road vehicle enthusiasts favor unroaded status for parts of Devil's Rim, Upper Nile, and Wildcat segments. Most of the William O. Douglas Adjacent roadless segments are of interest to the local timber industry for saw timber.

E. Public Input

Public input during RARE II and at Forest Plan meetings reflect the same interest as mentioned under IV-D. RARE II response from 5,601 people showed 64 percent for non-wilderness, one percent for further planning, 17 percent for wilderness with boundary adjustment and 18 percent for wilderness as inventoried. There was and still is interest to enter the roadless area for activities other than those compatible with roadless classification.

F. Other Public Involvement

In scoping timber sale plans with interested parties and other agencies, there appears to be interest in keeping the Miners Ridge, Devil's Rim, Upper Nile, and Rattlesnake segments roadless. Most would prefer roadless motorized but, in the case of Miners Ridge, they would prefer roadless unmotorized. None of the sales adjacent to the roadless segments have been appealed to date.

V. ENVIRONMENTAL CONSEQUENCES ASSOCIATED WITH THE ALTERNATIVES

A. Environmental Consequences Associated with the Alternatives

1. Recreation

a. Significant Effects

Alternatives B, D and J would not allocate any of the area to unroaded management. Under these alternatives the area would be entered for harvest. The area would lose its pristine character and present a roaded modified forest setting to the recreation user. All existing trail systems will be left intact but portions of trails will be crossed by roads.

Alternatives A, C, E, F, G, H, and I would allocate varying portions of the William O. Douglas Adjacent roadless area to roadless management objectives. Alternative C provides for 191 acres of Unroaded Semi-primitive, Motorized setting. Alternatives E, F, and G provide for the same Unroaded Semi-primitive, Motorized opportunities as Alternative C. Alternatives F and G provides for 1,187 acres of Unroaded Semi-primitive, Non-motorized Recreation opportunities in the Devil's Rim area. Alternative E provides 21,412 acres of Unroaded Semi-primitive, Non-motorized Recreation opportunities. This alternative allows for the maximum roadless recreation opportunities and wilderness potential.

Under Alternatives C and I, the portion of the trail system in this roadless area is allocated as follows:

Trail Name	Trail Number	Unroaded Non-Motorized	Unroaded Motorized	Roaded Motorized
Wild Cat Creek	1113	1.4	--	1.4
American Ridge	958	2.0	--	2.0
Little Bald Mtn	961	--	--	10.1
Mt. Aix	982	0.4	--	0.4
Totals		3.8	--	13.9

b. Summary

The following tables indicate, by alternative, the degree to which this area will be allocated to roadless management and, of the roadless management acres, what percent is motorized and non-motorized. These represent the Semi-primitive Motorized and Semi-primitive Non-Motorized Recreation Opportunity Spectrum (ROS) Classes. The area being allocated to roaded types of management activities will become Roaded Natural or Roaded Modified ROS opportunities depending on the intensity of development.

Percent of the Area Having Unroaded Allocation

Alternative	A/NFMA	B	C Preferred	D	E	F	G	H	I	J
	3	0	1	0	100	11	6	3	1	0

Percent of the Unroaded Allocation Area
In Terms of Motorized/Non-Motorized Recreation

Alternative	A/NFMA	B	C Preferred	D	E	F	G	H	I	J
	0/100	0/0	100/0	0/0	1/99	65/45	14/86	0/100	100/0	0/0

The area being allocated to roaded management activities will have increased dispersed roaded recreation opportunities and the possible opening of access to potential developed recreation sites. The trail miles within the area allocated to roading may provide a less semi-primitive recreation experience with a more roaded natural or roaded modified setting.

2. Wild, Scenic, and Recreational Rivers

A portion of the following river corridors (one-quarter mile either side of the river) is being located within this roadless area and is recommended for designation in Alternatives C and I:

<u>River</u>	<u>Recommended Classification</u>
American River	Segment 2 Scenic

More information concerning this recommendation can be found in Chapter III and Chapter IV.

3. Cultural Resources

Consideration of cultural resource values are required by a special set of historic preservation laws, regulations and policies. Particular efforts will be made in every alternative to inventory, evaluate, and provide for significant cultural resources in areas where Forest management activities are planned.

4. Scenery

Alternatives A and H allocate much of the area to Retention and Partial Retention VQO. The Bumping Lakes viewshed will be allocated to Retention VQO. The Middleground view will be allocated to Maximum Modification VQO. Most of the area along the trail will have high scenic quality.

Alternatives B, D and J will allocate most of the area to Maximum Modification. A very high percentage of the area adjacent to the wilderness will be heavily altered. The Bumping Lake viewshed will be Maximum Modification. Unnatural landscapes will dominate the area.

Alternatives C and I will allocate approximately two-thirds of the area to Retention and Partial Retention. Most trails will have some scenic quality. Most foreground will have a Partial Retention VQO. Outside of the foreground areas, the land will be heavily altered. The area adjacent to Meeks Table will be Maximum Modification. Bumping Lakes viewshed will have high scenic quality.

Alternative E will allocate all lands to Retention VQO. Scenic quality will be at a very high level. Natural appearing landscape will dominate the landscapes.

Alternative F will allocate most of the land to Retention and Partial Retention VQO. Bumping Lakes viewshed and other trails will have high visual quality. A few areas outside of the foreground area will be heavily altered.

Alternative G will allocate most lands to Retention and Partial Retention VQO. The Bumping Lakes viewshed is allocated to Retention VQO. Most middleground will be Partial Retention VQO. A few areas in the middleground views will be heavily altered. A slightly altered condition will be the overall middleground view.

The following table summarizes the Scenic component of this area by alternative in acres of Visual Quality Objective (VQO).

VQO	A/NFMA	B	C Preferred	Alternative		F	G	H	I	J
				D	E					
Preservation	--	--	--	--	--	--	--	--	--	--
Retention	17,829	5,194	8,225	5,194	22,874	16,853	16,854	17,829	8,225	3,032
Partial Retention	657	1,717	7,950	1,717	--	4,452	4,452	657	7,950	3,815
Modification	--	572	1,569	572	64	64	445	--	1,569	1,526
Maximum Modification	4,452	15,455	5,194	15,455	--	1,569	1,187	4,452	5,194	14,565
Total Acres	22,938	22,938	22,938	22,938	22,938	22,938	22,938	22,938	22,938	22,938

Preservation indicates that only natural, ecological changes will occur.

Retention indicates an essentially natural appearing landscape will be present.

Partial Retention indicates the landscape will be slightly altered.

Modification indicates a moderately altered landscape will be present.

Maximum Modification indicates a heavily altered landscape may be present.

5. Wildlife

Alternatives A, C, H, and I would have similar effects on wildlife. These effects would be one-third the effects that Alternatives B and D would have. Alternatives B and D would road all of the area and emphasize timber harvest on 70 percent of the area. Alternative E would have no effect on the wildlife resources. Alternatives F and G would have considerably more effect on wildlife than E but less than the other alternatives.

6. Fisheries

a. Significant Effects

In Alternative E, all the areas of the William O. Douglas Adjacent roadless area with fish populations would remain roadless. In the other alternatives the stream and lake areas would be managed in a variety of different ways. Because Dog Lake is immediately next to a highway and appears to have no wilderness characteristics for fish or fishing, it won't be covered in this discussion. Table (A) depicts the management prescriptions for the stream areas included in this roadless area.

Roading these areas could change the recreational fishing opportunities, although the total mileage of streams in this roadless area is small. Since about two-thirds of the Forest's fishing occurs in roaded areas, it is expected that fishing would increase slightly. This would help to meet a portion of the long term fishing demand but also could result in overfishing and reduction in both numbers and size of fish using the habitat.

Roading the unroaded areas could also result in environmental degradation to streams due to timber harvest and road construction in the basins. Some of these possible effects are addressed in the soil and water environmental effects section. Of particular environmental concern are the North and South Forks of Rattlesnake Creek which are directly upstream of anadromous fish habitat. However, the stream miles affected in this roadless area are insignificant compared to the total Rattlesnake Creek stream miles.

b. Mitigation Measures

In the alternatives that could road presently unroaded areas, the riparian protection zone prescription, the Wenatchee National Forest's Best Management Practices (September 1980 and revised October 1982), and all standards and guidelines common throughout riparian areas of the Forest would be applied in stream zones. In the Rattlesnake drainages, there appears to be the opportunity to keep any new roading entirely away from the Creeks. This treatment should adequately protect the streams from a reduction in fish habitat capability.

If the areas are roaded, road closures could be implemented to reduce the impact of enhanced access on the native fish populations.

TABLE (A). Allocation of management prescriptions in the William O. Douglas Adjacent roadless area in stream areas for Alternatives A, B, C, D, F, G, H, I and J. Where "Ext" is shown, this indicates that an extended shelterwood timber management prescription would dominate in that area and would be executed primarily to meet visual objectives. Where "Int" is shown, this indicates that an intensive timber management prescription could dominate in that area. Where "Rdis" is shown, this indicates that the management prescription would be to maintain the area as roadless.

Where "big game" is shown, this indicates that the management prescription would be to maximally produce appropriate forage for big game. And, where "recreation" is shown, a special interest recreation area would be designated. (M = mile)

Stream/River	A/H	B/D/J	Alternative C/I	F	G
Granite Creek	All Ext	Lower 2 M: Int.	All Ext.	All Recreation	All Ext.
North Fork Rattlesnake Ck.	All Int.	All Int.	All Game	All Ext.	All Game
South Fork Rattlesnake CK.	All Int.	Lower 1 M: Game	Lower: GF/Game	Lower 1/4 M: Ext.	All Rdls.
		Upper 1 M: Int.	Upper Rdls	Upper: 1 M Rdls.	
Wildcat Creek	All Ext.	All Int	All Ext.	All Ext.	All Ext.

7a. Vegetation: Trees

Tree management would be planned on all but 784 tentatively suitable acres under Alternatives A/NFMA and H. Total vegetation manipulation area would be similar under Alternatives B, D and J. However, under these alternatives the emphasis would be on timber production rather than other resource enhancement and protection.

No timber management would be permitted under Alternative E, but would be permitted on 17,829 acres, or 78 percent, under Alternative F.

Alternatives C and I would manage 5,194 acres for timber production emphasis (23 percent). In addition, 14,394 acres will be managed for other resource values, especially scenic travel, that permit scheduled timber harvest.

Alternative G emphasizes management to provide scenic travel on 16,621 acres, or 72 percent. Timber management would be emphasized on 1,187 acres. Like Alternative F, this alternative would establish a 1,187 acres unroaded non-motorized zone for recreation.

7b. Vegetation: Forage

This roadless area is made up of 10-15 areas adjacent to the William O. Douglas Wilderness. (See the Livestock writeup under General Information for this area.) Forage produced on one of the individual areas as part of the Forest base is not significant; however, as part of the large adjacent wilderness, it does have potential to contribute important forage for big game and livestock. Alternatives A, B, D and J will contribute forage in excess of needs. Alternative C, H, and I will contribute adequate forage for both livestock and big game. Alternatives E, F, and G will not produce for livestock in the fourth and fifth decade.

8. Soil and Water

a. Significant Effects

No significant soil and water consequences are associated with Alternative E because soil and water disturbing activities occurring would be minimal. Alternatives A, B, C, D, F, G, H, I and J could allocate up to 100 percent of the area to timber harvest and road building activity. The environmental effects of timber harvest and road building on soil and water are discussed in Chapter IV - Soil and Water sections

The risk of degrading the soil and water resource increases with more timber harvest and road building activity. Alternatives A, B, C, D, F, G, H, I and J pose more risk of degrading the soil and water resource than Alternative E due to the amount of activity. However, since Wenatchee National Forest Best Management Practices (1982) and Forest Plan Standards and Guidelines will be employed, no unique soil and water effects are anticipated because of forest management in this area.

b. Mitigation Measures

The mitigation measures that will be used in this area are the same as those discussed in Chapter IV - Soil and Water sections.

9. Air

As a result of the alternatives, the additional prescribed burning generated in the William O. Douglas Adjacent roadless area would not have a significant effect on air quality beyond the impacts discussed in Chapter IV.

10. Minerals

The area is encumbered by 9 lode claims, 3 placer claims, 8 pending geothermal lease applications, 6 oil and gas leases, and 12 pending oil and gas lease applications. A portion of the area has a probable potential for the occurrence of copper, gold, silver, molybdenum, tungsten, mercury, and manganese, while most of the area is prospectively valuable for oil and gas. Since none of the alternatives call for withdrawing any part of the area from mineral entry, the consequences on mineral resources do not appear to be extremely significant nor do they vary appreciably by alternative. However, the management prescriptions under which the area would be managed in each alternative would restrict mineral activities to varying degrees (i.e., special stipulations in leases and in approved operating plans). The effects of these restrictions cannot be quantified, but the negative influence they would have on interest in conducting exploration activities within the area does vary by alternative and will, therefore, affect the potential for discovering and/or developing any unknown mineral resources of the area. The relative variation between alternatives is depicted on the following table.

Consequences on Mineral Resources

Restrictive Nature of Management Prescriptions	Acres Restricted by Management Prescriptions									
	A/NFMA	B	C Preferred	D	E	F	G	H	I	J
Withdrawn from Mineral Entry (valid existing rights will be determined and recognized)	0	0	0	0	0	0	0	0	0	0
Highly Restrictive	2,416	2,416	4,240	2,416	22,874	6,911	3,307	2,415	4,240	2,056
Moderately Restrictive	16,070	5,067	13,504	5,067	64	14,482	18,444	16,070	13,504	6,317
Relatively Few Restrictions	4,452	15,455	5,194	15,455	0	1,569	1,187	4,452	5,194	14,565

11. Roads

The miles of local roads shown below for each alternative are those that are expected to be constructed to permit timber harvest. They are included in the totals for the various alternatives shown in Chapter IV of the FEIS. It is assumed that the bulk of these roads will be constructed within the next 20 years. An analysis of the road development in unroaded areas during the past ten years indicates that for every acre harvested approximately 5.5 acres are accessed. It is assumed that 50 percent of these roads will be closed to public traffic, and that the remainder will be suitable for travel by high clearance vehicles only.

These mileages are estimates based upon typical road densities necessary to harvest timber on different slope classes. The actual road miles that will result from the implementation of the various alternatives will be determined during project planning, design, and environmental analysis. The assumptions made for this analysis will be monitored. The construction of any road will be subject to the appropriate environmental analysis. That analysis will address the effects on resources that are dependent upon a roadless setting, including any adjacent roadless area or wilderness. The decision to close any road will be made on a case by case basis, according to the Forest Road Closure Policy found in the Forest-wide Standards and Guidelines.

	<u>Alternative</u>									
	A	B	C	D	E	F	G	H	I	J
Miles	52	49	48	49	0	42	45	52	48	49

12. Fire

The fire management workload generated in the William O. Douglas Adjacent roadless area as a result of the alternatives, will not have a significant effect beyond the effects already described in Chapter IV.

A slight increase in risk of recreation related fires would occur in Alternative E. Additional road access due to increased timber harvest activity would also increase risk of fire in Alternatives B, D and J.

The cost efficiency of fire suppression activities would be slightly increased in Alternatives B, D and J as road access would allow more area to be covered by ground based suppression resources. Cost efficiency levels in Alternative E would be less due to slower initial attack by ground forces or the use of more expensive aerial delivered resources such as helitack or smokejumpers.

The impacts generated by slash disposal activities are discussed in Chapter IV.

13. Social/Economic

To measure this area in terms of its social value, a basic assumption is being made. That is, because of the expressed interest in keeping as much of the inventoried roadless areas as possible in an unroaded condition, the more that condition is reflected, the higher the social value.

This condition is reflected for each alternative in the summary chart under item 1, Recreation, at the beginning of this section (Section V), which indicates the acres of unroaded management.

Also, as there is varying opinion as to the mode of transportation allowed, each individual must judge for themselves which alternative best meets that aspect of the social setting. There is also a summary table reflecting this condition for each alternative as referenced above which indicates the amount of motorized versus non-motorized use within the unroaded allocation.

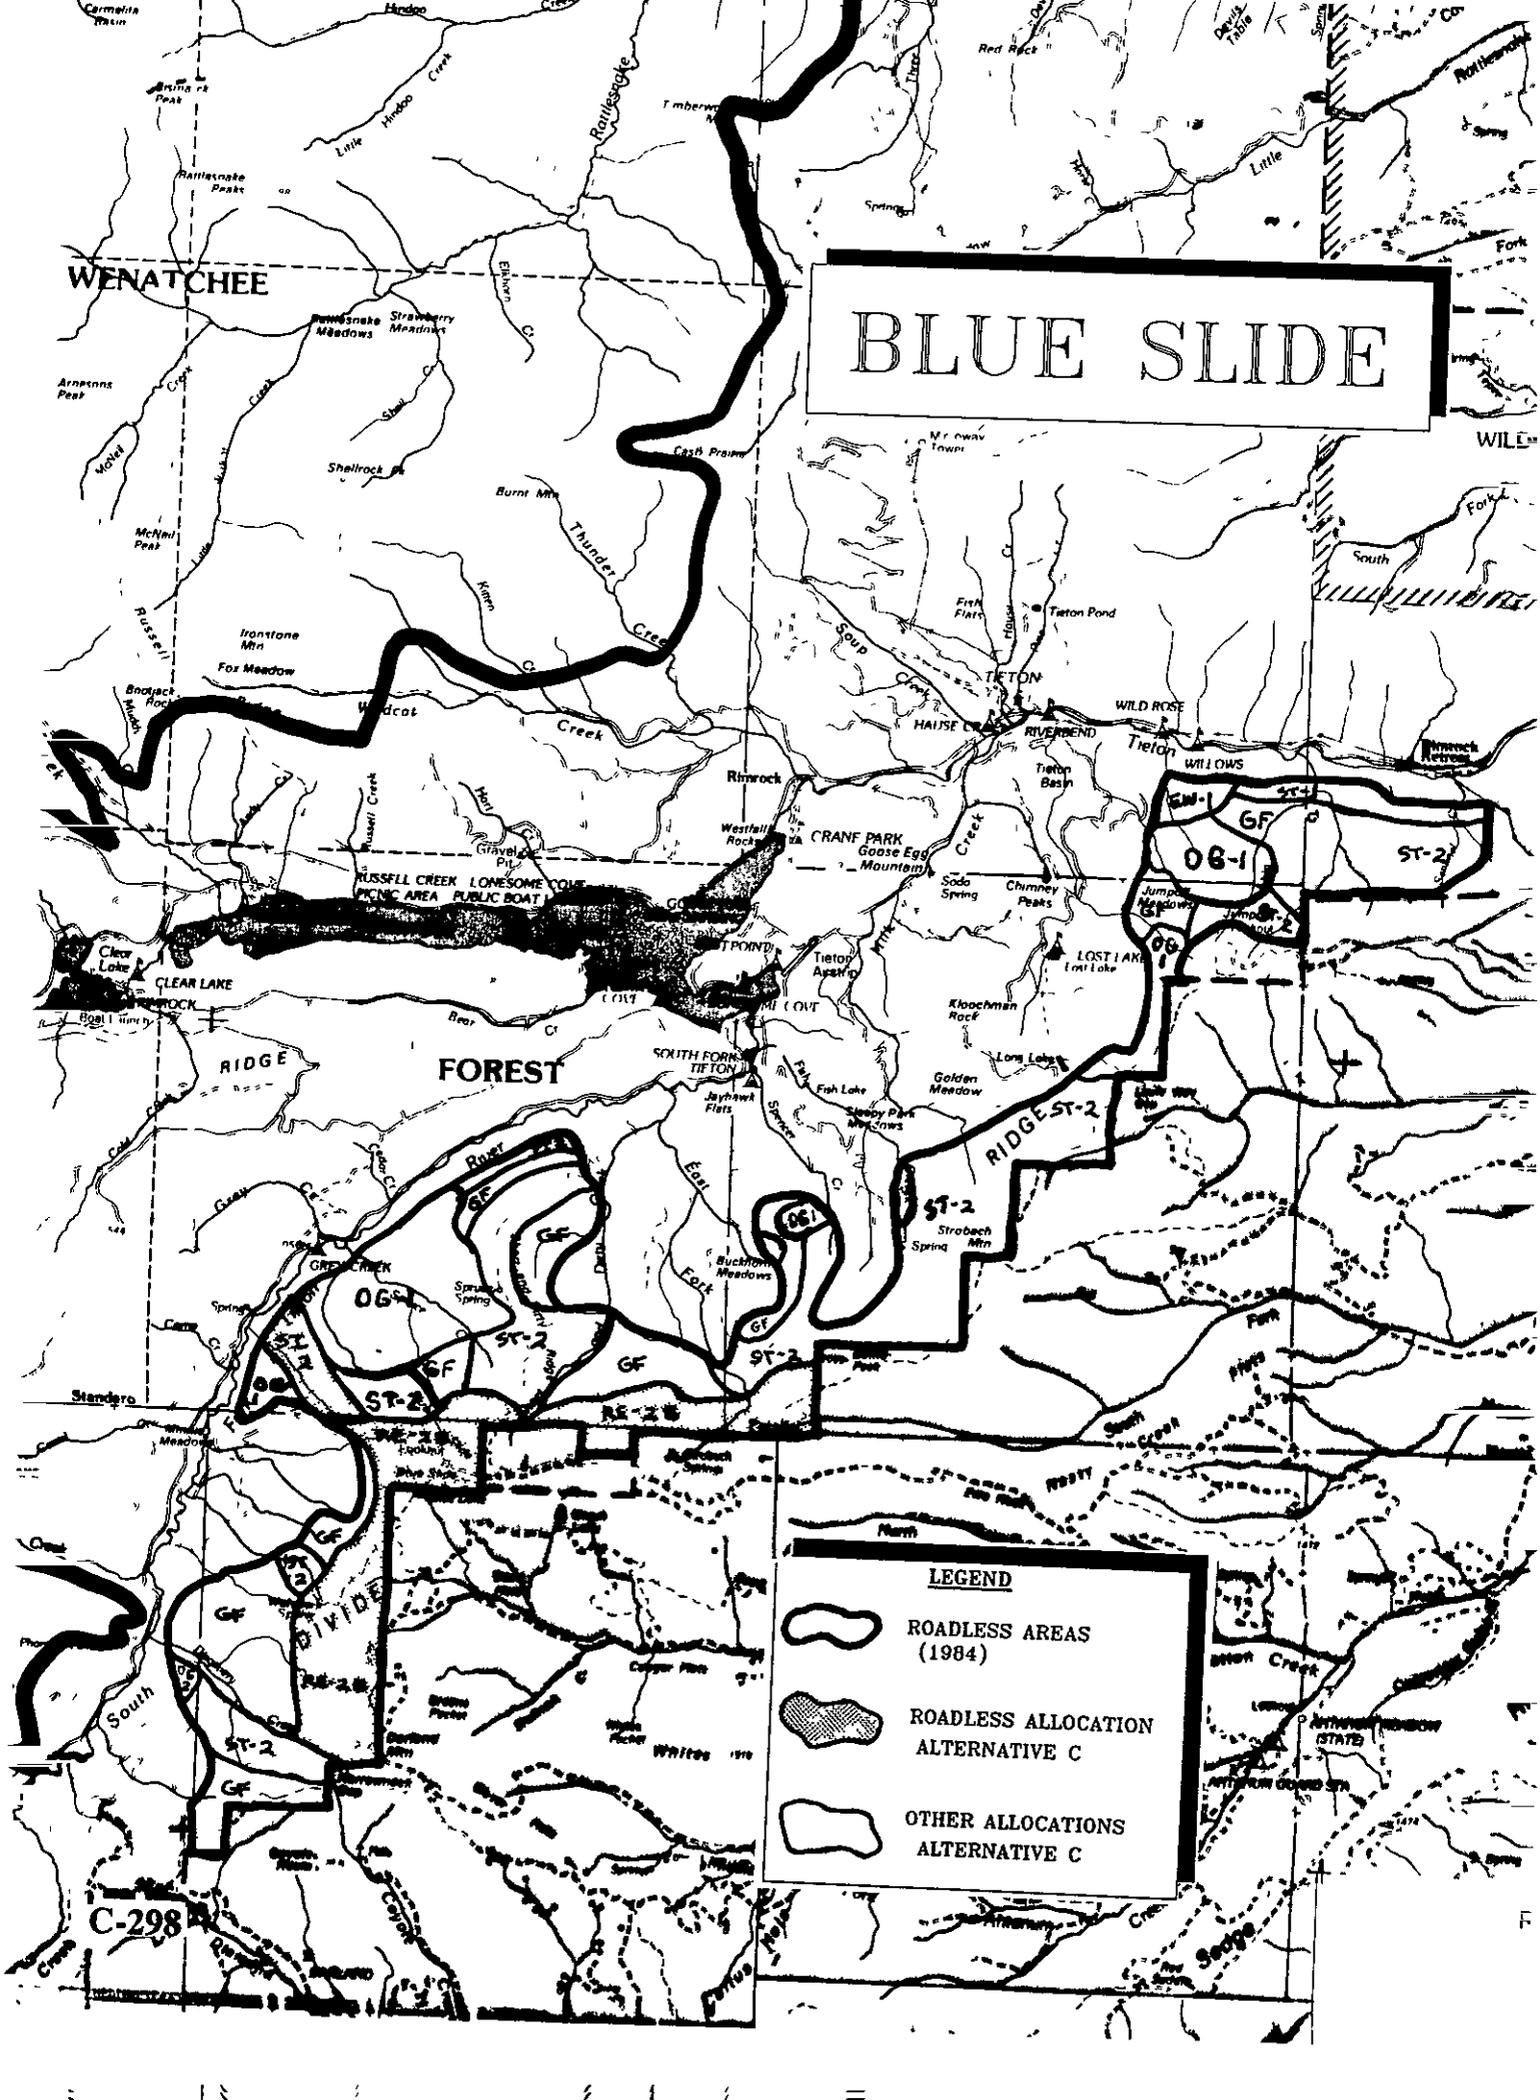

A general measure of timber oriented economic impacts can be made using the same table referenced above showing the amount of unroaded allocation. The larger the unroaded area, the greater the impact on timber oriented jobs. If all of the estimated long-term sustained yield per year for this area were available, it would support 53.8 jobs.

14. Wilderness Potential

This roadless area has very limited potential for wilderness. This area is composed of unroaded segments not included in the William O. Douglas Wilderness during the analysis of that area as wilderness. The only potential for these segments would be as additions to the William O. Douglas Wilderness.

Alternative E prescribes unroaded allocation to 100 percent of the area which retains the wilderness attributes of the area. The remainder of the alternatives prescribe only small acreages to remain unroaded. Alternatives A, H, B, D, and J allocate about 19,000 acres to roaded allocations including General Forest where road construction and timber management activities will occur. Alternatives C and I about 16,000 acres with 5,000 General Forest, to roaded allocations. These alternatives place high emphasis on retention of visual qualities. Alternatives F and G also allocate less acres to roaded prescription with a balance of resource allocations, but with minor emphasis on unroaded allocation.

BLUE SLIDE

WENATCHEE

FOREST

LEGEND

-  ROADLESS AREAS (1984)
-  ROADLESS ALLOCATION ALTERNATIVE C
-  OTHER ALLOCATIONS ALTERNATIVE C

C-298

BLUE SLIDE ROADLESS AREA

Size: Gross Acres: 19,695

Net Acres: 18,571

I. GENERAL INFORMATION

A. History

A portion of this area was allocated to roadless recreation under the multiple use plan. That portion plus some additional area inventoried and analyzed under RARE II as area No. 6035 was not recommended for wilderness. The area was not considered for wilderness under the Washington State Wilderness Act of 1984 legislative process.

B. Location and Access

The area is a short distance east of the Goat Rocks Wilderness in Yakima County on the Naches Ranger District. It is also located on the northern boundary of the Yakima Indian Reservation.

The area is readily accessible by roads and trail but main access is via U.S. Highway 12 and the Tieton and South Fork Tieton roads.

C. Physiography and Soils

This area generally lies below and to the north of the basalt cliffs along Divide Ridge. The basalt cliffs and the massive talus slopes below are very distinct. Below the talus slides the topography is somewhat undulating and bumpy in some places, indicating old landslide activity. There are also some areas with deeply incised canyons that have very steep sideslopes that give strong evidence of rapid downcutting.

Elevations range from 3,600 to 7,000 feet. Forty-seven percent of the soils have developed in basaltic materials, 30 percent in granitic materials, 20 percent in pyroclastic materials, 2 percent in sandstone, and the remainder in alluvial materials. The basaltic, pyroclastic, and sandstone materials tend to become slippery and sticky when wet and are easily compacted when moist. The granitic materials and the alluvium tend to be moderately coarse to coarse textured, so are generally not slippery or sticky when wet. They will compact, but not as easily as the former group.

D. Climate

The area lies within the 20-60 inch rainfall zone with an estimated 50 percent of the annual moisture falling as snow.

E. Vegetation

Forty-six percent of this area is tentatively suitable Forest land. Grand fir is probably the most common species on this predominantly north facing steep area, north of Divide Ridge. Lodgepole pine, western larch, and Douglas-fir are major species at lower elevations.

Most of the non-timbered areas are rock cliffs or active land slides. Some dry, shallow soil meadows and wet areas occur at the base of Divide Ridge. Jumpoff Meadow is one of the larger sedge, water and grass openings.

F. Current Uses

The current use is for dispersed recreation. The major activities and their estimated annual use are as follows:

<u>Activity</u>	<u>Estimated Annual Recreation Visitor Days</u>
Motorized trail riding, including 4x4	2,000
Hunting	4,000
Total	6,000

The area contains the following Recreation Opportunity Spectrum (ROS) class:

<u>ROS Class</u>	<u>Acres</u>
Semiprimitive Motorized (SPM)	18,571

There are 20.5 miles of trail in the area, and all are currently open to motorized use.

G. Appearance and Surroundings

The area has high, visual variety in landforms, moderate to high variety in rockforms and vegetation, and low to moderate variety in waterforms (lakes and streams).

The area has steep rugged ridgetops with sparse vegetation on the upper slopes and a highly textured vegetative pattern throughout. The drainage bottoms are rather densely vegetated. Fall color occurs on parts of the upper slopes. Some basalt formations are present on ridges and ridgetops.

The area is primarily foreground and middleground when viewed from the South Tieton Road, trails that lead from the valley floor to Divide Ridge, and the Divide Ridge Trail. Middleground and backgrounds are viewed from White Pass Highway (Hwy. 12) and Goat Rocks Wilderness.

The Blue Slide area is surrounded by the Yakima Indian Reservation and the upper parts of the South Fork Tieton.

H. Attractions

The area contains many basaltic rock bluffs and talus slopes. There are no major lakes or streams, but there are many springs scattered along the main ridge. Blue Slide, for which the area is named, is a large land slip and is visible from the South Fork of the Tieton drainage.

II. CAPABILITY-WILDERNESS CHARACTERISTICS

A. Manageability and Boundaries

The Blue Slide roadless area is bounded on the southwest by Divide Ridge, northeast by the breaks above the Tieton River, and northwest by the South Fork Tieton River and numerous Forest Service roads and harvest units. Divide Ridge is easy to find but the meandering roads and timber harvest units are somewhat difficult to locate on the ground or on a map. Most of the access roads to the Blue Slide area are graveled and provide easy access. All boundary roads, except the Divide Ridge primitive road, receive logging truck traffic as well as recreation traffic. All existing access roads have an effect on the sights and sounds of human intrusion on the area.

The Yakima Indian Reservation borders the southern section of this area south of Darland Mountain.

B. Natural Integrity

The impact of past human activity in the Blue Slide area has been relatively minor even though past activities have been extensive and motorized in nature. A system of existing roads nearly encircles the area. Several roads intrude into the area leaving less than half a mile wide strip of the roadless area in many places. An extensive trail system, which ties all branch trails to Divide Ridge, provides access to most of the area. All of the trail system and four-wheel-drive routes have had a history of motorized use for over 20 years. Several fire lookouts were built on the edge of this roadless area (Darland Mountain, Blue Slide, and Jumpoff). Only Jumpoff Lookout remains operational today.

C. Natural Appearance

The Blue Slide area is a long slender piece of land that, because of the topography, affords views of the drawdown of Rimrock Reservoir, State Highway 12 and several forest roads and many timber cutting units. Human activity is visible from most viewpoints within the area. The rugged cliffs of Divide Ridge have physically prevented roads to completely dissect the roadless area.

The segment of this area between Blue Slide Lookout and Jumpoff Lookout provides a unique scenic view corridor. Few continuous travelways on the Forest offer such splendid views for this distance. The hiking season on this view corridor is short due to water scarcity, and hikers generally abandon it by June 1. Though bikers do visit this corridor for riding challenges, the main attractions are the unique views.

D. Opportunities for Solitude

The area offers few opportunities for solitude. The 18,571 acres included occur in a fairly uniform northwest facing slope, exposing numerous activities of man to the roadless area visitor. The irregular side ridges of dissected topography with vegetative cover screen people from one another at short distances at the base of Divide Ridge.

E. Opportunities for Primitive Recreation

There are some opportunities for primitive recreation experience although all trails have been heavily impacted by motorbikes and four-wheel-drive activities. Because the area is heavily accessed by roads around the perimeter, big game hunting for elk and deer within the area is traditionally limited to day hunting.

F. Challenging Experiences

The primary challenge of the Blue Slide area is climbing the face of Divide Ridge and traversing Blue Slide itself. This could be very challenging as well as dangerous for the inexperienced.

G. Special Wildlife Features

There are no known threatened, endangered, or sensitive species in this area.

H. Historical and Scientific Study

There are opportunities for outdoor education, and scientific and historic study in the area relating to archeological research and early sheep grazing use.

III. RESOURCES AND POTENTIALS

A. Recreation

The area has potential value for unroaded types of recreation activities.

Estimated carrying capacity by ROS class is as follows:

ROS Class	Capacity in Potential Recreation Visitor Days Per Year
SPM	55,700

B. Wildlife

The area is summer range for several elk and deer herds. Black bear, grouse, and a number of other species utilize the area.

C. Fish

In this roadless area, there are three stream systems with wild populations of native cutthroat trout. Jumpoff Creek and Spruce Creek (and its south tributaries) have populations which could be considered significant, while Discovery Creek probably has only a small population. The population in Discovery Creek has not been field verified.

D. Water

The Bureau of Reclamation was granted 1st Form Withdrawal on portions of Section 28 and 30, T14N, R15E, WM. This granting was a result of an Executive Order dated August 8, 1907, called the Tieton Project. The withdrawn area presumably was considered as a reservoir site since the Project Area traverses the Tieton River in this portion of the roadless area.

Past records for stream discharge are excellent for the area. The gauging station, however, is no longer active. The last period of published record occurred in Water Year 1978. There are no official snow survey sites within the area. Average annual snow packs in the higher elevations are estimated at 150

inches. The majority of water derived from this roadless area and the Goat Rocks Wilderness is utilized for irrigation needs in the Yakima Valley.

E. Livestock

About 90 percent of this roadless area is within the existing Tieton Cattle Allotment. The remaining 10 percent is either part of the Conrad Meadow Cattle Allotment or a part of the South Fork Tieton Recreation Stock Allotment. The grazing resources potential is being realized through existing allotment plans.

F. Timber

The area contains 8,566 acres of tentatively suitable Forest land. Stand volume and other data area as follows:

Ecotype	Stand Size	Acres	Estimated Standing Volume (MMBF)	(MMCF)
Wet	Mature	3,625	102.7	18.9
Wet	Immature	3,541	63.7	11.6
Wet	Seedling-Sapling	170	---	---
Dry	Mature	339	4.2	0.8
Dry	Immature	891	8.7	1.6
	Total	8,566	179.3	32.9

The estimated maximum biological potential contribution to the long-term sustained yield is 2.7 MMBF (0.5 MMCF) per year.

G. Minerals

The geology of this area is dominated by Eocene sedimentary rocks, by Tertiary intrusive rocks, and by landslide or mudflow deposits of recent age. The area is bounded on the east by the Columbia River basalts. The area has not been investigated by the U.S.G.S. or U.S. Bureau of Mines, but available references indicate the only reported mineral occurrence of interest is bentonite which is of poor quality. The southern part of the area is classified "prospectively valuable" for coal resources, the western half of the area is classified "prospectively valuable" for geothermal resources, and the northeast one-third is classified "prospectively valuable" for oil and gas.

Bureau of Land Management mining claim recordation data (1/23/85) indicates there have been no mining claims located within the area; however, the area has been leased for its oil and gas resources under five existing leases. There are no pending applications and apparently little interest in the other two leasable commodities.

H. Cultural-Historical

The Blue Slide unit encompasses a portion of a major travelway, used by ancestors of the Yakima Indians to journey between their village sites in the Yakima Valley to areas in the upper Tieton Basin. One extensive lithic scatter has been inventoried and, considering the major ridgeline location of the unit and its proximity to the Yakima Reservation, Blue Slide has a high potential for the occurrence of other sites.

Historically, the unit was heavily utilized in the grazing of sheep and cattle. Three cabin sites identified in the Cold Creek and Grey Creek areas also indicate possible fur trapping use. In addition, there are two former lookout sites along the south edge of the Unit - Darland Mountain (1925-1966) and Blue Slide (1946-1971) - as well as the existing Jumpoff Lookout (built in 1958). Documents' research and further field study will undoubtedly augment the limited information currently available.

I. Land Use

There are no special land uses within the area.

J. Fire

Annual fire occurrence is low with most fires started by lightning. Fuel loadings are moderate with sparse timber stands and rocky peaks and meadows at higher elevations. Periodic smaller fires of 1 to 20 acres have occurred.

K. Insects and Disease

Mistletoe and root rots are very common to the grand fir and Douglas-fir stands occupying this area. Western spruce budworm is presently causing light defoliation in the eastern portion of this area. Entomologists expect this damage to intensify due to the large area of grand fir which is the preferred host of the budworm.

Following the 1977 drought year, some mature ponderosa pine were killed by the western pine beetle. However, most of these were salvaged along the lower portion of this area east of Jumpoff Meadows by 1979. More normal weather conditions have caused a return to low levels of beetle activity in this area.

L. Private Lands

There are 1,124 acres of private land within the area. The largest acreage belongs to the Burlington Northern Railroad Company and approximately half a section is owned by Ahtanum Irrigation.

Acquisition possibilities are considered fair for the railroad lands and poor for the other.

IV. NEED

A. Nearby Wilderness and Other Roadless Areas

This area is located just east of the 105,633 acre Goat Rocks Wilderness and south of the 167,195 acre William O. Douglas Wilderness.

B. Distance from Population Centers

The area is reachable within two to four hour's driving time from population centers such as Seattle-Tacoma, Yakima, Tri-Cities, and Wenatchee.

C. Need For Ecosystem Representation

There are no special or unique ecosystems within the area in need of representation through wilderness classification.

D. Interest By Proponents, Including Congressional

There has been no interest to date to make this area Wilderness. Local public and political proponents have expressed an interest not to classify the area as Wilderness.

E. Public Input

Of 914 responses to RARE II, 86 percent were for non-wilderness, 3 percent as further planning, and 11 percent for wilderness. The majority of the public users have expressed a desire to continue big game hunting and off-road vehicle use in the Blue Slide area. The Washington State Game Department has expressed the desire to keep the area roadless or at least gate roads after timber harvest on a seasonal basis. Other publics prefer that the roads remain open at all times so they may harvest firewood, mushrooms, Christmas trees, etc., and pursue big game hunting adjacent to the roadway. To date there has not been a large number of people who would prefer either wilderness or unroaded non-motorized classification for the area.

F. Other Public Involvement

There has been no other public involvement scoping outside of RARE II and the forest planning process except Interdisciplinary Team efforts involving proposed timber sales adjacent to the Blue Slide roadless area. This scoping process has included Forest Service specialists and planners, other agency people such as the Washington State Game Department, and specific groups such as the Tieton Recreation Association.

V. ENVIRONMENTAL CONSEQUENCES

A. Environmental Consequences Associated with the Alternatives

1. Recreation

a. Significant Effects

Alternatives A/NFMA, H, and J would not allocate any of the area to unroaded management. Under these alternatives the area would be entered for harvest. The area will lose its pristine character and present a Roaded Modified forest setting to the recreation user. Roadless character will be lost as a result of these management alternatives. All existing trail systems will be left intact but portions of trails will be crossed by roads.

Alternatives B, D, E, F, and G would allocate varying portions of the Blue Slide roadless area to Roadless Management objectives. Alternatives B and D would include 1,823 acres in Semi-primitive, Motorized. Only portions of the Divide Ridge four-wheel-drive route would be included in these alternatives.

Alternatives E, F, and G would allocate over 14,800 acres to Semi-primitive, Motorized use. These alternatives provide the most opportunities to develop Semi-primitive, Motorized recreation. Under all alternatives, Semi-primitive, Motorized recreation use would be at least maintained at current levels.

Alternatives C and I retain 2,947 acres for unroaded motorized recreation while maintaining a balance in other resource values including an emphasis on partial retention of scenic values.

Under Alternatives C and I the portion of the Trail System in the roadless area is allocated as follows:

Trail Name	Trail Number	Unroaded Non-Motorized	Unroaded Motorized	Roaded Motorized
Short and Dirty	1121	--	--	5.7
S. Divide Ridge	1136	--	--	3.0
Darland Mtn.	1137	--	--	2.8
Butcher Knife	1138	--	--	4.0
Blue Slide	1139	--	--	4.0
Long Lake	1145	--	--	1 0
Totals		--	--	20 5

b. Summary

The following tables indicate, by alternative, the degree to which this area will be allocated to roadless management and, of the roadless management acres, what percent is Motorized and Non-motorized. These represent the Semi-primitive, Motorized and Semi-primitive, Non-motorized Recreation Opportunity Spectrum (ROS) Classes. The area being allocated to roaded types of management activities will become Roaded Natural or Roaded Modified ROS opportunities depending on the intensity of development.

Percent of the Area Having Unroaded Allocation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	0	10	16	10	100	80	80	0	16	0

Percent of the Unroaded Allocation Area
In Terms of Motorized/Non-Motorized Recreation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	0/0	100/0	0/0	100/0	81/19	100/0	100/0	0/0	0/0	0/0

The area being allocated to roaded management activities will have increased dispersed roaded recreation opportunities and the possible opening of access to potential developed recreation sites. The trail miles within the area allocated to roading may provide a less semi-primitive recreation experience with a more roaded natural or roaded modified setting.

2. Wild, Scenic, and Recreational Rivers

There are none associated with this roadless area.

3. Cultural Resources

Consideration of cultural resource values are required by a special set of historic preservation laws, regulations and policies. Particular efforts will be made in every alternative to inventory, evaluate, and provide for significant cultural resources in areas where Forest management activities are planned.

4. Scenery

Alternatives A/NFMA and H will allocate four-fifths of the area to Retention and Partial Retention VQO. The Middleground viewshed from White Pass will be allocated as Partial Retention VQO. The south fork of the Tieton travel route will have visual protection. Most areas outside of the foreground will be Maximum Modification. Much of the area will not be visible except from the South Fork Tieton viewshed. Some views from Goat Rocks will be altered to heavily altered.

Alternatives B, D and J will allocate much of the land to Maximum Modification. High visual impacts will be from the White Pass viewshed middleground, South Fork Tieton, Middleground views from trails, and the view from the Goat Rocks Wilderness looking into the South Fork Tieton Basin will be Maximum Modification. A heavily altered condition will dominate the landscape. The Divide Ridge trails, the Blue Slide natural slides, and most foreground trails will have Partial Retention VQO.

Alternatives C and I will allocate approximately two-thirds of the area to Retention and Partial Retention VQO. Most of the foreground of trails and roads, and the Divide Ridge Trail will have Partial Retention VQO.

The middleground views from trails, the South Fork Tieton, and the view from the Goat Rocks Wilderness road looking into the South Fork Tieton will be altered. The Middleground view from White Pass (Highway 12) viewshed as viewed across the Rimrock Lake will have slightly to some altered visual condition. Maximum Modification VQO will be allocated to most areas outside of the above areas.

Alternative E will allocate most areas to Retention. Natural appearing landscape will dominate all lands

Alternative F will allocate all lands to Retention and Partial Retention VQO. Most areas will have high visual quality. The middleground views will have a Partial Retention VQO. A slightly altered condition will be the general landscape condition in the middleground.

Alternative G allocates the majority of the lands to Retention and Partial Retention VQO. A very small area will be allocated to Maximum Modification VQO. All viewsheds will have high visual quality.

The following table summarizes the Scenic component of this area by alternative in acres of Visual Quality Objective (VQO).

VQO	A/NFMA	B	Alternative							
			C PREFERRED	D	E	F	G	H	I	J
Preservation	--	--	--	--	--	--	--	--	--	--
Retention	8,098	5,957	7,992	5,957	18,401	14,447	17,468	8,098	7,992	4,134
Partial Retention	7,950	1,335	5,788	1,335	--	954	763	7,950	5,788	1,357
Modification	--	--	148	--	170	170	170	--	148	148
Maximum Modification	2,523	11,279	4,643	11,279	--	--	170	2,523	4,643	12,932
<u>Total Acres</u>	<u>18,571</u>	<u>18,571</u>	<u>18,571</u>	<u>18,571</u>	<u>18,571</u>	<u>18,571</u>	<u>18,571</u>	<u>18,571</u>	<u>18,571</u>	<u>18,571</u>

Preservation indicates that only natural ecological changes will occur.

Retention indicates an essentially natural appearing landscape will be present.

Partial Retention indicates the landscape will be slightly altered.

Modification indicates a moderately altered landscape will be present.

Maximum Modification indicates a heavily altered landscape may be present.

5. Wildlife

Alternatives A/NFMA and H would road all of the area and allow for timber harvest emphasis on about 18 percent of the area. Alternatives B and D would road 90 percent of the area. Alternative J would allocate 97 percent to roaded prescriptions. Alternatives A and H would have one-third the effect on wildlife resources that B, D and J would have. Alternatives C and I would road all of the area and allow for timber harvest emphasis on 39 percent of the area. Alternatives C and I would have slightly more than one-half the impact to wildlife that B and D would have. Alternative E would have minimal effect on wildlife. Alternatives F and G would have considerably more impact than E due to the roading, but less impact than A and H.

6. Fisheries

a. Significant Effects

In this roadless area, Jumpoff, Spruce, and Discovery Creeks are the only stream systems with known fish populations. With implementation of Alternatives E, F, or G, all these areas would remain roadless. With implementation of Alternatives B, C, D, or I, all the stream areas would be managed for intensive timber production. In Alternatives A and H, the Jumpoff and South Fork of Spruce Creek areas would be managed for intensive timber production while the main fork of the Spruce Creek and Discovery Creek areas would be managed with an extended shelterwood timber prescription which would be executed primarily to meet visual objectives.

Roading these areas could change the recreational fishing opportunities. Since about two-thirds of the Forest's fishing occurs in roaded areas, it is expected that recreational fishing would increase. This would help to meet a portion of the fishing demand, but also could result in overfishing and reduction in both numbers and size of fish using the habitat.

It is also possible that roading the unroaded areas could result in environmental degradation to streams due to timber harvest and road construction in the basins. Some of these possible effects are also addressed in the soil and water environmental effects.

b. Mitigation Measures

In the alternatives that could road presently unroaded areas, the riparian protection zone prescription, the Wenatchee National Forest's Best Management Practices (September, 1980 and revised October, 1982), and all standards and guidelines common throughout riparian areas of the Forest would be applied in stream zones. This treatment should adequately protect the streams from a reduction in fish habitat capability.

If the areas are roaded, road closures could be implemented to reduce the impact of enhanced access on the native fish populations.

7a. Vegetation: Trees

Current management direction under Alternatives A/NFMA and H does not preclude roading or vegetative manipulations through timber sales on any of this area except in dedicated old growth. Timber emphasis is allocated on 2,523 acres or 14 percent of the area under these alternatives. The remaining area is zoned special resource management area where timber sales will be used to manipulate the existing vegetation.

Alternative E allocates the entire roadless area to unroaded recreation where no timber sales are scheduled. Alternative F is similar with 80 percent or 14,861 acres, allocated to roadless recreation with no timber harvest.

Under Alternatives C and I, 8,523 acres, or 46 percent, of the area is suitable for timber harvest.

Alternatives B and D would be similar to Alternatives C and I. However, these would establish a 1,823 acre unroaded motorized zone. Most of the acres suitable under Alternatives B, D and J would be timber emphasis acres. Under Alternative G, the largest block of acres would be established for unroaded motorized dispersed recreation.

Alternative J allocates 12,392 acres (67 percent) to timber harvest emphasis and unlike Alternatives B and D, would leave no areas in roadless prescriptions.

7b. Vegetation: Forage

This roadless area contains portions of one or more livestock allotments. (See the Livestock write-up under General Information for this area.) With the proposed vegetation manipulation in some alternatives, adequate forage will be produced for big game and livestock. This will offset the loss of forage due to natural succession and the exclusion of fire. Alternatives C, H, and I will contribute adequate forage. Forage in excess of expected needs will be produced in Alternatives A/NFMA, B, D and J. Needs for forage in the fourth and fifth decades will not be met for livestock in Alternatives E, F and G.

8. Soil and Water

a. Significant Effects

The environmental consequences of allocating the Blue Slide area to General Forest or Roadless Management are discussed by alternative below. No significant soil and water consequences are associated with Alternative E because soil and water disturbing activities occurring would be minimal. Alternatives F and G could allocate up to 20 percent to timber harvest and road building, up to 87 percent for Alternatives B, C, D and I, and the entire area could be allocated to timber harvest activities in Alternatives A, H and J. The environmental effects of timber harvest and road building on soil and water are discussed in Chapter IV - Soil and Water sections.

The risk of degrading the soil and water resource in this area increases with more timber harvest and road building activities, particularly if these activities enter the zone of instability of the landslides. Alternatives A and H pose more risk of degrading the soil and water resource than Alternatives B, C, D and I, and Alternatives F and G, respectively. Intensive timber management and road building in the zone of instability could result in significant loss in long-term site productivity if the slide were triggered to erode more area. However, since Wenatchee National Forest Best Management Practices (1982) and Forest Plan Standards and Guidelines will be employed, no unique soil and water effects are expected to occur because of forest management in this area.

b. Mitigation Measures

The mitigation measures that will be used in this area are the same as those discussed in Chapter IV - Soil and Water sections.

9. Air

The additional prescribed burning generated in the Blue Slide roadless area as a result of the alternative would not have a significant effect on air quality beyond the impacts discussed in Chapter IV.

10. Minerals

As the previous discussion indicates, the area is not encumbered by mining claims, but it has been leased for oil and gas, and it is considered to be prospectively valuable for oil and gas, coal, and geothermal resources. Based upon currently available information, the area appears to have a low potential for the occurrence of mineral resources and, therefore, the consequences on mineral resources do not appear to be extremely significant nor do they vary appreciably by alternative. However, the management prescriptions under which the area would be managed in each alternative do restrict mineral activities to varying degrees (i.e., special stipulations in leases and in approved operating plans). For example, a withdrawal precludes all mineral related activities except those authorized by prior existing rights; and a designation as a Roadless Non-motorized area or as a Developed Recreation site, Special Area or as a Wild and Scenic River calls for the area to be managed under highly restrictive management prescriptions. The effects of these restrictions cannot be quantified, but the negative influence they would have on interest in conducting exploration within the area does vary slightly by alternative and will, therefore, affect the potential for discovering and/or developing any unknown mineral resources of the area.

This relative variation between alternatives is depicted on the following table.

Consequences on Mineral Resources

Restrictive Nature of Management Prescriptions	Acres Restricted by Management Prescriptions									
	A/NFMA	B	C PREFERRED	Alternative D	E	F	G	H	I	J
Withdrawn from Mineral Entry (valid existing rights will be determined and recognized)	0	0	0	0	0	0	0	0	0	0
Highly Restrictive	3,562	5,808	6,658	5,808	18,401	15,709	15,794	3,562	6,658	4,134
Moderately Restrictive	12,486	1,484	7,270	1,484	170	2,862	2,607	12,486	7,270	1,505
Relatively Few Restrictions	2,523	11,279	4,643	11,279	0	0	170	2,523	4,643	12,932

11. Roads

The miles of local roads shown below for each alternative are those that are expected to be constructed to permit timber harvest. They are included in the totals for the various alternatives shown in Chapter IV of the FEIS. It is assumed that the bulk of these roads will be constructed within the next 20 years. An analysis of the road development in unroaded areas during the past ten years indicates that for every acre harvested approximately 5.5 acres are accessed. It is assumed that 50 percent of these roads will be closed to public traffic, and that the remainder will be suitable for travel by high clearance vehicles only.

These mileages are estimates based upon typical road densities necessary to harvest timber on different slope classes. The actual road miles that will result from the implementation of the various alternatives will be determined during project planning, design, and environmental analysis. The assumptions made for this analysis will be monitored. The construction of any road will be subject to the appropriate environmental analysis. That analysis will address the effects on resources that are dependent upon a roadless setting, including

any adjacent roadless area or wilderness. The decision to close any road will be made on a case-by-case basis, according to the Forest Road Closure Policy found in the Forest-wide Standards and Guidelines.

	<u>Alternative</u>									
	A	B	C	D	E	F	G	H	I	J
			PREFERRED							
Miles	25	21	21	21	0	5	5	25	21	25

12. Fire

The fire management workload generated in the Blue Slide roadless area as a result of the alternatives will not have a significant effect beyond the effects already described in Chapter IV.

A slight increase in risk of recreation related fires would occur in Alternatives E, F, and G. Additional road access due to increased timber harvest activity would also increase the risk of fire under Alternatives A/NFMA, B, D, H and J.

The cost efficiency of fire suppression activities would be slightly increased in Alternatives A, B, D, H and J as road access would allow more area to be covered by ground based suppression resources. Cost efficiency levels in Alternatives E, F, and G would be less due to slower initial attack by ground forces or the use of more expensive aerial delivered resources such as helitak or smokejumpers.

The impacts generated by slash disposal activities are discussed in Chapter IV.

13. Social/Economic

To measure this area in terms of its social value, a basic assumption is being made. That is, because of the expressed interest in keeping as much of the inventoried roadless areas as possible in an unroaded condition, the more that condition is reflected, the higher the social value.

This condition is reflected for each alternative in the summary chart under item 1, Recreation, at the beginning of this section (Section V), which indicates the acres of unroaded management.

Also, as there is varying opinion as to the mode of transportation allowed, individuals must judge for themselves which alternative best meets that aspect of the social setting. There is also a summary table reflecting this condition for each alternative as referenced above which indicates the amount of motorized versus non-motorized use within the unroaded allocation.

A general measure of timber oriented economic impacts can be made using the same table referenced above showing the amount of unroaded allocation. The larger the unroaded area, the greater the impact on timber oriented jobs. If all of the estimated long-term sustained yield per year for this area were available, it would support 33.6 jobs.

14. Wilderness Potential

This roadless area has limited potential as wilderness due to the evidence of human activity that is spread throughout the area. Motorized use of the area has been extensive.

Alternatives A/NFMA, C, H and I allocated some of the area to unroaded prescriptions. Alternative E at 100 percent, and F and G at 80 percent, provide high level allocations to unroaded conditions. Alternatives B, D and J allocate 13 percent of the area to unroaded allocations, and about 14,000 acres to roaded allocations. Alternatives C and I allocate a balance of resource allocations with about 9,000 acres allocated to roaded allocations. Alternatives E, F and G provide the greatest retention of unroaded attributes.

GOAT ROCKS ADJACENT ROADLESS AREA

Size: Gross Acres: 7,548

Net Acres: 7,357

I. GENERAL INFORMATION

A. History

The original area was analyzed and studied under RARE II as D6036 and was recommended for further planning. It was reanalyzed as part of the 1984 Washington State Wilderness Act of 1984 legislative activity, and 11,173 acres were added to the existing Goat Rocks Wilderness under that act.

B. Location and Access

These areas are immediately adjacent to the eastern boundary of the Goat Rocks Wilderness in Yakima County on the Naches Ranger District.

Access is by way of U.S. Highway 12 and the North Fork, South Fork and main Tieton River roads in addition to the Pinegrass road.

C. Physiography and Soils

There are six separate areas in this unit; however, all are similar. The slopes are mostly convex and reasonably uniform. The units all occur in the middle to lower slope positions.

Elevations range from 3,300 to 6,200 feet. About 80 percent of the area is made up of soils that have formed in basaltic materials, about 15 percent of soils that have formed in pyroclastic materials, and the remainder in either granitic material or glacial till. The basaltic and pyroclastic soils tend to be slippery and sticky when wet and easily compacted when moist. Soil depths for the basaltic soils generally range from 20 to about 40 inches, and soil depths for the pyroclastic soils usually range from about 30 to about 60 inches. The granitic and glacial till soils, on the other hand, are coarser textured so are usually not slippery or sticky when wet. Soil compaction is also less of a problem with these soils. Soil depths for both the granitic soils and the glacial till soils usually range from about 24 to about 36 inches.

D. Climate

Annual precipitation ranges from 45 to 70 inches, mostly as snow. Snow depths can range to 15 feet.

E. Vegetation

Fifty-six percent of this area is tentatively suitable forest land. The major species at high elevation, such as the area west of Section 3 Lake, is mountain hemlock, lodgepole pine, whitebark pine, and alpine fir. Western larch, Douglas-fir, western hemlock, and western red cedar occupy lower elevation areas.

False azalea, sedges, and huckleberry species are common understory plants. Pine grass occurs in association with sedges on lower Pinegrass Ridge.

F. Current Uses

Most current use is dispersed recreation. The major activity and its estimated annual use are as follows:

Activity Estimated Annual Recreation Visitor Days

Hunting 1,000

The area contains the following kinds and amounts of Recreation Opportunity Spectrum (ROS) Classes.

<u>ROS Class</u>	<u>Acres</u>
Semi-primitive Non-Motorized (SPNM)	3,880
Semi-primitive Motorized (SPM)	3,477
Total	7,357

There is only 0.5 of a mile of trail within the area which is open for motorized travel.

G. Appearance and Surroundings

The area has low to moderate visual variety in landforms and vegetation, and low variety in rockforms and waterforms (lakes and streams).

The area has highly textured sideslopes and is flat in topography. Rock formations and prominent landforms throughout the area are not dominant. The vegetation is a mixture of patterns with some fall colors occurring.

The area is primarily viewed as middleground from the North and South Fork Tieton roads and background from the Goat Rocks Wilderness.

The Goat Rocks roadless area is surrounded by the Goat Rocks Wilderness, the upper end of the South Fork of the Tieton River, and the North Fork of the Tieton River.

II. CAPABILITY-WILDERNESS CHARACTERISTICS

A. Manageability and Boundaries

The Goat Rock roadless areas are found adjacent to the existing Goat Rocks Wilderness near Round Mountain, Pinegrass Ridge, south of Bear Creek near Phantom Lake, and west of Cirque Lake. Most of these areas are adjacent to forest roads and timber harvest units. Some of the boundaries would be difficult to find because there are few topographic or legal features to follow.

The south unit borders the Yakima Indian Reservation.

B. Natural Integrity

The impact of past human activity in Goat Rocks Adjacent roadless areas has been relatively minor even though those activities have been extensive. Existing roads border the area on the east. This roadless area is made up of scattered parcels of land that are joined together by the Goat Rocks Wilderness established on July 3, 1984. Because of the add-on effect, there are no trails serving the Goat Rocks Wilderness Adjacent roadless areas. There are no signs of motorized vehicle use in the additional areas except on the rim of Pinegrass Ridge overlooking the North Fork Tieton River. Two lookouts (Bear Creek Mountain and Round Top Mountain) were constructed in the area, but foundations are all that remain. Both sites lie within the existing Wilderness.

C. Natural Appearance

The Goat Rocks Adjacent roadless areas are not too different from the classified Wilderness except they protrude outward and are encircled by activities of man.

Even with the adjacent wilderness lands, persons visiting the area would not feel they were very far from human activity. Most of the roadless areas look out to harvested units and constructed roads. The rugged cliffs of Pinegrass Ridge offer the most significant feeling of naturalness of the Goat Rocks Adjacent roadless areas.

D. Opportunities for Solitude

The additional roadless areas offer little in the way of solitude by themselves. Without the adjacent wilderness to the west, there would be few opportunities for solitude. The 7,357 acres included in the 5 areas protrude outward from the classified Goat Rocks Wilderness providing little screening from man's activities except for short distances on Pinegrass Ridge.

E. Opportunities for Primitive Recreation

Considering the adjacent classified Wilderness, opportunities for primitive recreation experiences are moderately high.

F. Challenging Experiences

With only game trails for access, the add-on roadless areas would be challenging to travel in. The rugged cliffs west of Pinegrass Ridge would be challenging and dangerous for all but the most experienced mountaineer.

G. Special Wildlife Features

There have been sightings of peregrine falcon reported but no nesting sites have been located. No other threatened or endangered species have been located in the area, though there is a bald eagle nest at nearby Rimrock Lake. The extent of use of the area by sensitive species is unknown.

H. Historical and Scientific Study

There are no special or unique opportunities for outdoor education and scientific or historic study in the area which cannot already be found in the existing wilderness on the Forest.

III. RESOURCES AND POTENTIALS

A. Recreation

The area has potential value for unroaded types of recreation activities.

Estimated carrying capacity by ROS Class is as follows:

ROS Capacity In Potential Recreation Visitor Days Per Year

SPNM	3,900
SPM	10,000
Total	13,900

B. Wildlife

Wildlife populations in the area include deer, elk, and black bear. Game birds such as blue, ruffed, and spruce grouse are present.

C. Fish

No special features regarding fish are known in this area. Cold Creek (Pinegrass Ridge) is known to have a very small population of native cutthroat trout.

D. Water

There are no water related encumbrances or planned projects within the area.

E. Livestock

This roadless area is now made up of five small areas along the edge of the Goat Rocks Wilderness. The three areas lie within portions of the North Fork and South Fork Recreation Stock Allotments. These may be potential for sheep grazing when combined with adjacent developed roaded areas.

F. Timber

The area contains 4,091 acres of tentatively suitable forest land. Stand, volume, and other data are as follows:

Ecotype	Stand Size	Acres	Estimated Standing Volume (MMBF)	(MMCF)
Wet	Mature	3,032	85.9	15.8
Wet	Immature	741	13.3	2.4
Wet	Seedling-Sapling	106	---	---
Dry	Mature	149	1.6	0.3
Dry	Immature	63	0.6	0.1
	Total	4,091	101.4	18.6

The estimated maximum biological potential contribution to the long-term sustained yield is 1.1 MMBF (0.2 MMCF) per year.

G. Minerals

This area is primarily underlain by volcanic and intrusive rocks of Quaternary and Pliocene age. The Goat Rocks Wilderness and adjacent roadless areas have been investigated by the U.S. Geological Survey and U.S. Bureau of Mines (Church, S.E. and others, Map MF-1653-A). As a result of their study, it does not appear that the subject land has any known mineral potential. The area has, however, been classified "prospectively valuable" for geothermal resources, and a small part has been classified "prospectively valuable" for coal. In addition, based upon magnetotellurics and gravity surveys, there is a possibility for the occurrence of oil and gas in the sedimentary rocks lying east of the Goat Rocks pluton

According to Bureau of Land Management claim recordation data (1/23/85), there are no mining claims located within the area. There are, however, two geothermal lease applications pending for area R-1, and R-2 is included in an existing oil and gas lease.

H. Cultural-Historical

The lands within the proposed Goat Rocks addition were marginal to most historic events and developments of the Naches and Yakima Valleys. Probable uses were confined to livestock grazing and sporadic trapping. Tribal groups now included within the Yakima Indian Nation are known to have regularly used the Goat Rocks Wilderness Area for resource collection, travel, and, possibly, religious observances. However, this unit is peripheral to the areas of known or suspected prehistoric use and consequently has a low to moderate probability for the occurrence of archaeological resources.

I. Land Use

There are no special land uses within the area.

J. Fire

Annual fire occurrence is low with most fires started by lightning. Fuel loadings are moderate with sparse timber stands, and rocky peaks and meadows at higher elevations. Periodic smaller fires, 1 to 20 acres, have occurred.

K. Insects and Disease

Root rots are the most damaging agent in this area. The large plantation on the adjacent Pinegrass Ridge was due to Englemann spruce bark beetle attacks. However, this roadless area has a relatively good mix of species and a less than normal risk of insect epidemic. Mountain pine beetles have, however, killed most of the scattered western white pine in the area.

L. Private Lands

There are 191 acres of private lands within the area. These lands are part of the Herke estates and acquisition possibilities are very poor.

IV. NEED

A. Nearby Wilderness and Other Roadless Areas

This area is located immediately adjacent to the 105,633 acre Goat Rocks wilderness area.

B. Distance From Population Centers

The area is reachable within two to four hour's driving time from population centers such as Seattle-Tacoma, Yakima, Tri-Cities, and Wenatchee.

C. Need for Ecosystem Representation

There are no special or unique ecosystems within the area in need of representation through wilderness classification.

D. Interest by Proponents, Including Congressional

The interest in the original Goat Rocks Wilderness additions was very high by proponents of wilderness and by Congressman Morrison; however, the establishment of the new 1984 Wilderness boundary concluded their interest for the most part. The remaining add-on roadless areas have not had strong support for either Wilderness or roadless non-motorized classification. An exception is the Washington State Department of Wildlife which prefers all unroaded areas to remain unroaded or at least prohibit vehicle use seasonally on roads.

E. Public Input

In the original RARE II public input, there was significant interest in adding the original Goat Rocks additions to the existing Wilderness, however, there has been little input on the add-on roadless areas as to the public's preference.

Of the 4,279 responses under RARE II, 67 percent were for non-wilderness, 1 percent further planning, 21 percent for wilderness with boundary adjustment, and 11 percent for wilderness as inventoried.

F. Other Public Involvement

The only scoping process in the area has been on adjacent areas outside of the roadless areas on timber sale plans. The scoping process has included outside agency people such as Washington State Department of Wildlife and specific user groups affected by the timber sale.

V. ENVIRONMENTAL CONSEQUENCES

A. Environmental Consequences Associated with the Alternatives

1. Recreation

a. Significant Effects

The Goat Rocks adjacent area consists of 7,357 acres located in pieces and adjacent to the east boundary of the Goat Rocks Wilderness in the southern portion of the Naches Ranger District. Approximately 4,091 acres of the area are inventoried as suitable for Timber Management, General Forest. The majority of the remaining land is concentrated along the northwest edge of Pinegrass Ridge. It is capable of offering unroaded, non-motorized, dispersed recreation, due to its steep terrain and proximity to existing Goat Rocks Wilderness.

Due to the proposed expansion of the adjacent developed ski area at White Pass, and accommodating terrain, 212 acres have been determined suitable for that purpose under Alternatives B, C, D, F, G, I and J.

The roadless character of the Cirque Lake area and depth of the Goat Rocks Wilderness at Surprise Lake will be lost as a result of Alternatives B, C, D, F, G, and I. Ski area development allocated by all alternatives may affect the wilderness experience at Shoe Lake which already has an over-use problem associated with day use. These alternatives may also reduce the quality of present cross-country ski use along Hogback Ridge and increase conflicts with Pacific Crest Trail hiker use.

Alternatives A/NFMA and H would allocate 5,598 acres for Dispersed Recreation, Non-motorized. Alternative F resembles Alternatives A and H but reduces the amount of Dispersed Recreation, Non-motorized setting.

Alternative E quite simply favors Dispersed Recreation, Non-motorized over all other uses. There are no system trails in this roadless area other than a portion of the Tandy 4x4 route (0.5 miles) Under Alternatives C and I this route will be retained.

b. Summary

The following tables indicate, by alternative, the degree to which this area will be allocated to roadless management and, of the roadless management acres, what percent is motorized and non-motorized. These represent the Semiprimitive Motorized and Semiprimitive Non-Motorized Recreation Opportunity Spectrum (ROS) Classes. The area being allocated to roaded types of management activities will become Roaded Natural or Roaded Modified ROS opportunities depending on the intensity of development.

In Terms of Motorized/Non-Motorized Recreation

Alternative	A/NFMA	B	C PREFERRED	D	E	F	G	H	I	J
	0/100	0/0	100/0	0/0	0/100	0/100	0/100	0/100	100/0	0/0

The area being allocated to roaded management activities will have increased dispersed roaded recreation opportunities and the possible opening of access to potential developed recreation sites. The trail miles within the area allocated to roading may provide a less semi-primitive recreation experience with more roaded natural or roaded modified setting.

2. Wild, Scenic, and Recreational Rivers

There are none associated with this roadless area.

3. Cultural Resources

Consideration of cultural resource values are required by a special set of historic preservation laws, regulations and policies. Particular efforts will be made in every alternative to inventory, evaluate, and provide for significant cultural resources in areas where Forest management activities are planned.

4. Scenery

Alternatives A/NFMA and H allocate much of the land to Retention VQO. The North Fork of the Tieton middleground view will be allocated to Partial Retention VQO. The Maximum Modification allocation will be in areas not visible from important recreation viewsheds.

Alternatives B, D and J allocate the majority of the area to Maximum Modification. Most areas adjacent to the Wilderness will be heavily altered. The Pinegrass area and the middleground view from the North Fork Tieton viewshed will be altered. The visual impression of the landscape will be a heavily altered one.

Alternatives C and I will allocate approximately one-half of the area to Retention and Partial Retention VQO. The North Fork Tieton middleground will be allocated to Partial Retention. The Pinegrass area will be allocated to Maximum Modification VQO.

Alternative E will allocate all lands to Retention VQO. The natural appearing landscape will be preserved. Scenic quality will dominate the landscape.

Alternative F will allocate most lands to Retention and Partial Retention VQO. A small area will be heavily altered. The Partial Retention of the middleground of the North Fork Tieton will keep the viewshed in a high visual quality.

Alternative G will allocate lands mostly to Retention and Maximum Modification. The recreational routes will be in a high visual quality. More lands in the middleground and the Pinegrass area will be Maximum Modification. A slightly altered condition will be the general landscape impression in most areas.

The following table summarizes the Scenic component of this area by alternative in acres of Visual Quality Objective (VQO).

VQO	A/NFMA	B	Alternative							
			C PREFERRED	D	E	F	G	H	I	J
Preservation	--	--	--	--	--	--	--	--	--	--
Retention	6,361	657	4,411	657	7,357	5,661	4,559	6,361	4,411	636
Partial Retention	530	191	1,823	191	--	297	530	530	1,823	191
Modification	--	--	--	--	--	--	--	--	--	--
Maximum Modification	466	6,509	2,588	6,509	--	1,399	2,268	466	2,588	6,530
Total Acres	7,357	7,357	7,357	7,357	7,357	7,357	7,357	7,357	7,357	7,357

Preservation indicates that only natural ecological changes will occur.

Retention indicates an essentially natural appearing landscape will be present.

Partial Retention indicates the landscape will be slightly altered.

Modification indicates a moderately altered landscape will be present.

Maximum Modification indicates a heavily altered landscape may be present.

5. Wildlife

Alternatives A/NFMA and H would road 24 percent and allow timber harvest emphasis on 6 percent of the area. Alternatives B, D and J would allow for timber harvest emphasis on 89 percent, and would road 97 percent of the area. Alternatives B and D would have 15 times the impact on wildlife habitat that A and H would have. Alternatives C and I would road 82 percent of the area and allow for timber harvest emphasis on 35 percent of the area. Alternatives C and I would have approximately one-third the impact on wildlife of B, D and J. Alternative E would have no effect on the wildlife resources in the area. Alternative F would road 50 percent of the area and allow for timber harvest emphasis on 19 percent of the area. Alternative G would road 69 percent and emphasize timber harvest emphasis on 31 percent of the area. Alternatives F and G would have the second and third least effect on wildlife habitat, respectively.

6. Fisheries

a. Significant Effects

Only a very small section of Cold Creek (less than one-half mile) is included in this roadless area, and it is the only stream with known fish populations. In Alternative E, the Cold Creek area would remain roadless, while in Alternatives A, C, F, G, H, and I the area would be managed with an extended shelter-wood timber harvest strategy, primarily to meet visual objectives. In Alternatives B, D and J, the area would be managed with a timber management emphasis. Since Cold Creek is very small, and is known to have very low numbers of resident fish, it is unlikely that implementation of any alternative would have a particular effect on the fisheries habitat capability of the stream.

b. Mitigation Measures

In the alternatives that could road the Cold Creek area, the riparian protection zone prescription, the Wenatchee National Forest's Best Management Practices (September 1980 and revised October 1982), and all standards and guidelines common throughout riparian areas of the Forest would be applied in stream zones. This treatment should adequately protect the streams from a reduction in fish habitat capability.

If the areas are roaded, road closures could be implemented to reduce the impact of enhanced access on the native fish populations.

7a. Vegetation: Trees

Vegetation manipulation is not currently planned on 5,598 acres (76 percent) of this area under Alternatives A/NFMA and H. This classification would increase to the total area under Alternative E.

Increased vegetative manipulation through timber sales would be expected under all other alternatives. Under Alternatives C, G, and I, it is expected that uneven-aged management would be used in the mountain hemlock type to achieve the increased scenic travel retention and partial retention.

Under Alternatives B, D and J, it is expected that with most of the acres in General Forest even-aged management would be used wherever possible.

7b. Vegetation: Forage

This roadless area contains portions of one or more livestock allotments. (See the Livestock writeup under General Information for this area.) With the proposed vegetation manipulation in some alternatives, adequate forage will be produced for big game and livestock. This will offset the loss of forage due to natural succession and the exclusion of fire. Alternatives C, H, and I will contribute adequate forage. Forage in excess of expected needs will be produced in Alternatives A/NFMA, B, D, and J. Needs for forage in the fourth and fifth decades will not be met for livestock in Alternatives E, F, and G.

8. Soil and Water

a. Significant Effects

The environmental consequences of allocating the Goat Rocks Adjacent roadless area to General Forest or Roadless Management are discussed by alternative below. No significant soil and water consequences are associated with Alternative E because soil and water disturbing activities occurring would be minimal. Alternatives A/NFMA, F, and H could allocate up to 49 percent to timber harvest and road building, Alternative G about 69 percent, Alternatives C and I about 82 percent, while Alternatives B, D, and J could allocate the entire area to timber activities. The environmental effects of timber harvest and road building on soil and water are discussed in Chapter IV - Soil and Water sections.

The risk of degrading the soil and water resource increases with more timber harvest and road building activity. Alternatives B, C, D, G, I and J pose more risk than Alternatives F, A, H, and E, respectively, due to the intensity of activity. However, since Wenatchee National Forest Best Management Practices (1982) and Forest Plan Standards and Guidelines will be employed, no unique soil and water effects are anticipated because of forest management in this area.

b. Mitigation Measures

The mitigation measures that will be used in this area are the same as those discussed in Chapter IV - Soil and Water sections.

9. Air

Any additional prescribed burning generated in the Goat Rocks Adjacent roadless area as a result of the alternatives would not have a significant effect on air quality beyond the impacts discussed in Chapter IV.

10. Minerals

Since this area appears to have a low potential for the occurrence of mineral resources, the consequences on mineral resources do not appear to be extremely significant nor do they appear to vary appreciably by alternative. However, the management prescriptions under which the area would be managed in each alternative would restrict mineral activities to varying degrees (i.e., special stipulations in leases and in approved operating plans). The effects of these restrictions cannot be quantified, but the negative influence they would have on interest in conducting exploration activities within the area does vary by alternative and will, therefore, affect the potential for discovering and/or developing any unknown mineral resources of the area. This relative variation between alternatives is depicted on the following table.

Consequences on Mineral Resources

Restrictive Nature of Management Prescriptions	Acres Restricted by Management Prescriptions									
	A/NFMA	B	C PREFERRED	Alternative D	E	F	G	H	I	J
Withdrawn from Mineral Entry (valid existing rights will be determined and recognized)	0	0	0	0	0	0	0	0	0	0
Highly Restrictive	5,640	212	1,505	212	7,357	4,410	2,460	5,640	1,505	212
Moderately Restrictive	1,251	636	3,264	636	0	1,548	2,629	1,251	3,264	1,526
Relatively Few Restrictions	466	6,509	2,588	6,509	0	1,399	2,268	466	2,588	6,530

11. Roads

The miles of local roads shown below for each alternative are those that are expected to be constructed to permit timber harvest. They are included in the totals for the various alternatives shown in Chapter IV of the FEIS. It is assumed that the bulk of these roads will be constructed within the next 20 years. An analysis of the road development in unroaded areas during the past ten years indicates that for every acre harvested approximately 5.5 acres are accessed. It is assumed that 50 percent of these roads will be closed to public traffic, and that the remainder will be suitable for travel by high clearance vehicles only.

These mileages are estimates based upon typical road densities necessary to harvest timber on different slope classes. The actual road miles that will result from the implementation of the various alternatives will be determined during project planning, design, and environmental analysis. The assumptions made for this analysis will be monitored. The construction of any road will be subject to the appropriate environmental analysis. That analysis will address the effects on resources that are dependent upon a roadless setting, including any adjacent roadless area or wilderness. The decision to close any road will be made on a case-by-case basis, according to the Forest Road Closure Policy found in the Forest-wide Standards and Guidelines.

Alternative

	A/NFMA	B	C	D	E	F	G	H	I	J
			PREFERRED							
Miles	6	14	14	14	0	8	12	6	14	14

12. Fire

The fire management workload generated in the Goat Rocks Adjacent roadless area as a result of the alternatives will not have a significant effect beyond the effects already described in Chapter IV.

A slight increase in risk of recreation related fires would occur in Alternatives A, E, F, and H.

The cost efficiency of fire suppression activities would be slightly decreased in Alternatives A, E, F, and H due to less access for ground force initial attack or the use of more expensive aerial delivered resources such as helitack or smokejumpers.

The impacts generated by slash disposal activities are discussed in Chapter IV.

13. Social/Economic

To measure this area in terms of its social value, a basic assumption is being made. That is, because of the expressed interest in keeping as much of the inventoried roadless areas as possible in an unroaded condition, the more that condition is reflected, the higher the social value.

This condition is reflected for each alternative in the summary chart under item 1, Recreation, at the beginning of this section (Section V), which indicates the acres of unroaded management.

Also, as there is varying opinion as to the mode of transportation allowed, individuals must judge for themselves which alternative best meets that aspect of the social setting. There is also a summary table reflecting this condition for each alternative as referenced above which indicates the amount of motorized versus non-motorized use within the unroaded allocation.

A general measure of timber oriented economic impacts can be made using the same table referenced above showing the amount of unroaded allocation. The larger the unroaded area, the greater the impact on timber oriented jobs. If all of the estimated long-term sustained yield per year for this area were available, it would support 13.4 jobs.

14. Wilderness Potential

The small segments of land that make up this roadless area are relatively undisturbed, unroaded areas that have good potential as wilderness. This potential only exists as additions to the Goat Rocks Wilderness. Alternatives B, D and J allocate more of the area to unroaded condition and 6,700 acres to roaded, timber harvest allocation. In these alternatives, wilderness characteristics would be foregone. Alternative E is 100 percent unroaded and would retain the wilderness attributes. Alternatives A and H allocate the percent of the area to unroaded prescriptions with only 1,611 acres in roaded, timber harvest allocations. Alternatives C and I allocate a balance resource emphasis with 5,407 acres allocated to roaded, timber harvest allocations.

NASON RIDGE ROADLESS AREA

Size: Gross Acres: 19,567

Net Acres: 19,123

I. GENERAL INFORMATION

A. History

This area was inventoried and allocated to various management categories during the Alpine Lakes management planning. It was not recommended for wilderness and is not being managed as such. It is being managed according to the Alpine Lakes Management Plan.

B. Location and Access

The area is located entirely in Chelan County on the Lake Wenatchee Ranger District just east of Stevens Pass. Access is via U.S. Highway 2 (Stevens Pass) and the Smith Brook-Rainy Creek Road #6700.

C. Physiography and Soils

This area is characterized by steep rock slopes and is highly visible from U.S. Highway #2 and from Lake Wenatchee. The ridge includes several prominent peaks, Round Mountain on the east, Alpine lookout, Mt. Mastiff, Mt. Howard, and Rock Mountain. The bedrock is mostly mezozoic granitic in origin, which includes granite, gneiss, schist, and some diorites. The lower slopes have been glaciated, but the upper slopes have not, so most of the outcroppings are angular and rugged. About 20 percent of the area is made up of cliffs and talus. There are several small lakes along the ridgetop.

Elevations range from about 3,300 to about 7,100 feet, and the precipitation ranges from 55 to 65 inches per year. About 70 percent of the soils have formed in granitic residuum, and about 20 percent formed in glacial till. The glacial till soils are generally located on the lower slopes. In general, neither of these materials become slippery when wet. Both have fairly high rock contents and both have good bearing strength. The remainder of the area is composed of several different parent materials. The glacial till soils tend to be more productive than the soils formed in granitic residuum. The surface layers of most of the soils have some volcanic ash in them.

D. Climate

The area lies within the 50-80 inch precipitation zone, with over half in the form of snow. There are no snow courses in the area but average snow depths are over 80 inches

E. Vegetation

Thirty-nine percent of this area is tentatively suitable forest land. This consists of a ridge area between Nason Creek and Lake Wenatchee. All but 254 acres of the area is wet ecotype with grand fir and Douglas-fir stands predominating at lowest elevations, and Pacific silver fir, western hemlock, and western red cedar the main species at mid-elevation. Upper slope species are subalpine fir, whitebark pine, lodgepole pine, and Englemann spruce.

Avalanche paths containing willow, mountain ash, mountain maple, and Sitka alder are common. These periodic avalanches also stimulate forbs and grasses important to the mountain goat herd that is often photographed and studied on Nason Ridge.

Present proposals are to let prescribed fire from slash treatment on adjacent timber sales burn up into this roadless area for goat habitat enhancement. Such burning releases nitrogen from existing vegetative growth for new higher protein forage.

F. Current Uses

The current use is all dispersed recreation. The major activities and their estimated annual use are as follows:

<u>Activity</u>	<u>Annual Recreation Visitor Days</u>
Motorcycle	400
Hiker	1,500
Horse	100
Total	2,000

The area contains the following Recreation Opportunities (ROS) class:

<u>ROS Class</u>	<u>Acres</u>
Semi-Primitive, Motorized	19,123

There are 39 miles of trail within the area of which 10 miles are currently open to motorcycle use. The other miles are closed administratively.

G. Appearance and Surroundings

The area has a great deal of visual variety of landform, vegetation, rock formation, and water.

The area is steep with a rounded ridgetop and highly textured hillside, sparse vegetation on ridgetops and a broken, open, mixed-conifer vegetation pattern on most of the sideslopes. Fall colors are present along the mid and upper slopes of the ridge.

The area is viewed as foreground and middle ground from:

<u>Trails</u>	<u>Roads</u>
Nason Ridge	U.S. Highway 2
Round Mountain	State Highways 209 and 207
Merritt Lake	Little Wenatchee Road #6500
Rock Lake	Smithbrook - Rainy Creek Road #6700
Snowy Creek	Lake Wenatchee
Hidden Lake	Fish Lake
Dirty Face	

Attractions

The ridgetop and spectacular, panoramic views obtained from it are a drawing card. It is readily accessible from Highway 2. It is suitable for both day and overnight use. Alpine Lookout, Merritt Lake, and Rock Mountain Lake are focal points.

II. CAPABILITY-WILDERNESS CHARACTERISTICS

A. Manageability and Boundaries

The roadless area boundaries are somewhat difficult to locate. They appear to follow timber type lines rather than readily definable topographic boundaries.

The heavily used major highways, with adjacent railroad and powerline corridors, bring sights and sounds of human intrusion all the way to the ridgetops.

B. Natural Integrity

This area was considered for wilderness during the Alpine Lakes Plan Development and was not selected. There are obvious signs of human activity within this area. The trail system is well developed and there is a fire lookout occupied during fire season. Development along Stevens Pass Highway to the south and towards Lake Wenatchee to the north can be readily seen from the ridge. Motorized (motorcycle) use is allowed along the eastern portion of the ridge.

C. Natural Appearance

The area is large enough and visitors are far enough away from major roads in some places that they get the feeling they are in a natural area relatively distant from human activity and development even though such activity is readily apparent in the valley bottoms. The sweeping panoramic views of the distant Pacific Crest give a feeling that the area has much greater depth than it actually has.

D. Opportunities for Solitude

The area offers limited opportunities for solitude. Use is confined to a few major access trails and the ridgetop due to the cliffy nature of the side slopes. Extensive overnight use is confined to a relatively few locations due to scarceness of water.

E. Opportunities for Primitive Recreation

Opportunities for primitive recreation are moderate. The size and access to the area are such that it is possible to visit any single location in a single day.

There are opportunities for limited goat and deer hunting, horseback riding, motorcycle riding, hiking, and camping.

F. Challenging Experiences

Some challenging experiences exist but have limited attraction. It would be very challenging to select bee-line routes from the valley floor straight up to the ridgetop but few if any would choose this means of access in favor of the trail system. No long distance hikes for Boy Scouts or other groups can be obtained in this area.

G. Special Wildlife Features

There is a herd of about 120 mountain goats which use the area as winter range.

There are no grizzly bear in the area.

Golden eagles have been observed and there are probably some nests in the cliffs.

H. Historical and Scientific Study

Game Department and University officials have been trapping and tagging goats for study.

No other special studies are in progress.

III. RESOURCES AND POTENTIALS

A. Recreation

The area has potential for unroaded types of recreation. Estimated carrying capacity by ROS Class are:

<u>ROS</u>	<u>Capacity in Potential Recreation Visitor Days/Per/Year</u>
Semi-Primitive Motorized	57,369

B. Wildlife

Goat winter and summer range is provided in the area. The cliffs and talus provide excellent habitat for species dependent on this type of habitat.

C. Fish

High lakes, including Lost and Hidden Lakes, provide habitat for native trout. Many are periodically stocked and fished. There are no anadromous fish streams in the area although the streams in this area feed Nason Creek, the Little Wenatchee River, and Lake Wenatchee which do support an anadromous fishery. These latter streams provide abundant anadromous fish habitat.

D. Water

There are no water related encumbrances or planned activities within this area.

E. Livestock

There are no allotments within this area although in years past there has been some sheep grazing.

F. Timber

This area contains 7,441 acres of tentatively suitable forest land. The most common tree species is subalpine fir. Pacific silver fir, lodgepole pine, western hemlock, western white pine, Douglas-fir, noble-fir, and whitebark pine are also present. Other data on the existing suitable forest stands are as follows:

Ecotype	Stand Size	Acres	Estimated Standing	
			Volume MMBF	MMCF
Dry	Mature	254	3.2	.6
Wet	Mature	3,625	102.7	18.9
Wet	Immature	3,371	60.6	11.1
Wet	Seedlings and	191		
Wet	Saplings			
		7,441	166.5	30.6

The estimated maximum biological potential contribution to the long-term sustained yield is 2.5 MM Bd. Ft., or 0.4 MM Cu. Ft., per year.

G. Minerals

This area is underlain by pre-Tertiary metamorphic rocks and Mesozoic granitic rocks. Even though the area has not been studied in detail by the U.S. Geological Survey, available information indicates that the area has reported occurrences of molybdenum, graphite, garnet, asbestos, and quartz. None, however, are known to be deposits of a significant nature. Bureau of Land Management mining claim recordation data indicates that only nine mining claims have been located within the area, none of which have a reported history of production. The eastern two miles of the area have been classified "prospectively valuable" for coal resources, but available information indicates that any deposits would not be of commercial value. The area is not classified "prospectively valuable" for any other leasable commodity, and it is not encumbered by any mineral leases or pending lease applications.

H. Cultural-Historical

The Nason Ridge Roadless Area was marginal to most cultural activities in the Lake Wenatchee country, although it would have been an attractive travelway considering the high elevation and scenic vistas. There has been a negligible level of cultural resource survey conducted to verify the presence or absence of sites here. Historic uses are associated with early twentieth century sheep grazing, with the former site of the Rock Mountain Lookout (1933-1973), and with the original Alpine Lookout (1936-1975, after which it was replaced by the present structure).

I. Land Use

There is no special land use within the area. Some water transmission permits get water from streams originating in the area.

J. Fire

Annual fire occurrence is low. Fuel loadings are heavier at lower elevations. There is a fire history in the area. Mountain goat winter range was enhanced by the fire.

K. Insects and Disease

Dwarf mistletoe and root rots are common in the lower elevation Douglas-fir and grand fir stands. Mountain pine beetles are active in white pine and lodgepole pine. Whitebark pine is severely damaged by white pine blister rust.

L. Private Lands

There are 444 acres of land owned by the Longview Fibre Company within the area.

IV. NEED

A. Nearby Wilderness and Other Roadless Areas

The area is in very close proximity to the Henry M. Jackson Wilderness and the Alpine Lakes Wilderness. It is near the Glacier Peak Wilderness.

B. Distance from Population Centers

The distance from population centers is within 2-3 hours driving time from the Seattle-Puget Sound area which comprises 60 percent of the State's population.

C. Need for Ecosystem Representation

There is no need for the ecosystem representation.

D. Interest by Proponents, Including Congressional

E. Public Input

F. Other Public Involvement

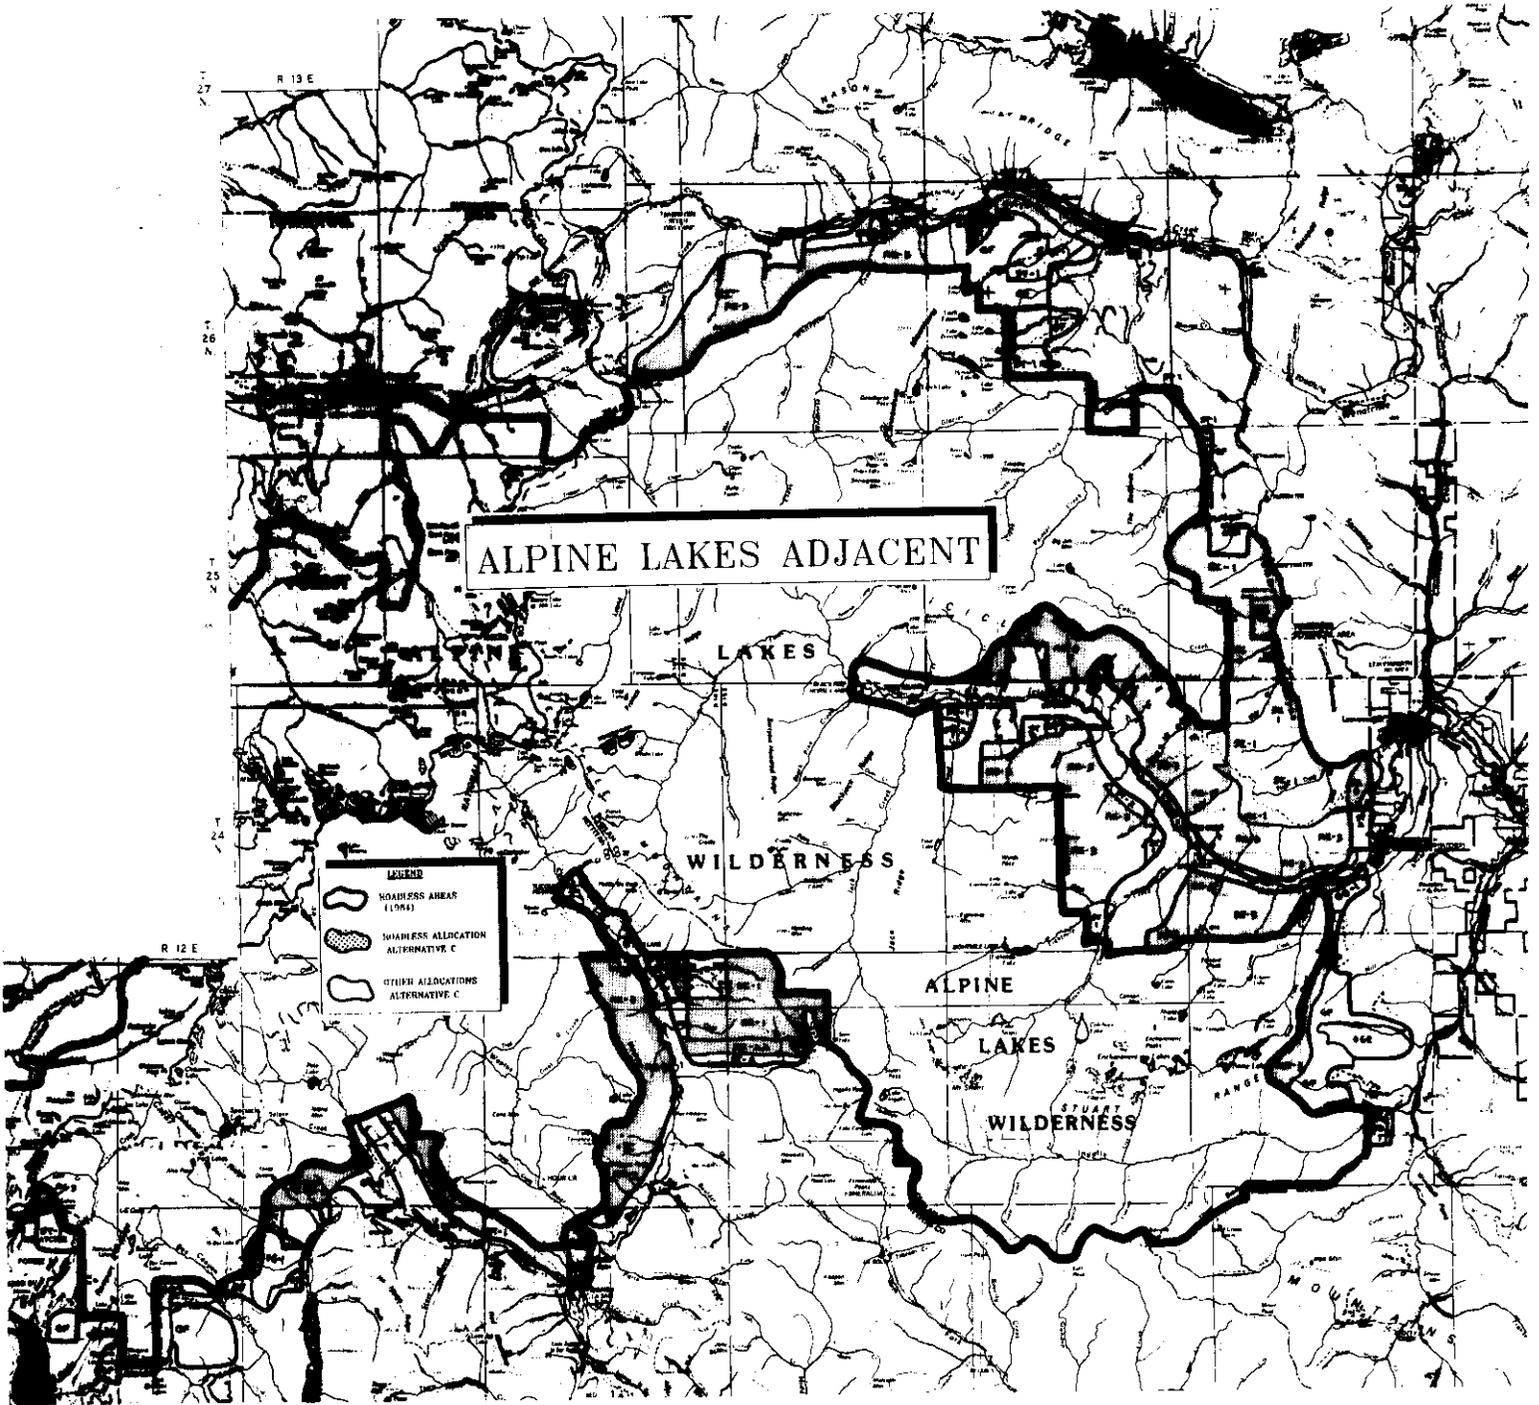

Interest by proponents, public input, and other public involvement are discussed on pages 113 through 119 in the 1980 Final Environmental Impact Statement for the Alpine Lakes Management Plan which is available for review in the Wenatchee National Forest Supervisor's Office. Comments covered a broad range of subjects including more restrictive management, four-wheel-drive use, road construction, timber sales, campground development, and land allocations. The Land allocation was the only subject mentioned for this area.

V. ENVIRONMENTAL CONSEQUENCES

A. Environmental Consequences Associated with the Alternatives

As the management of this area will be that directed by the Alpine Lakes Management Plan and will not change by the alternatives being considered under this planning process, a full analysis is not being made here.

The environmental effects associated with the implementation of the selected plan for the Alpine Lakes Management Area are discussed by resource on pages 86 through 90 of the 1980 Final Environmental Impact Statement which is available for review in the Wenatchee National Forest Supervisor's Office.

ALPINE LAKES ADJACENT ROADLESS AREAS

Size: Gross Acres: 64,363

Net Acres: 44,393

I. GENERAL INFORMATION

A. History

The area was inventoried under the Alpine Lakes Management Plan. These are fragments left between the wilderness boundary and roaded development. These pieces were not considered for wilderness as part of the Washington State Wilderness Act of 1984 program.

B. Location and Access

The areas lie in Kittitas and Chelan Counties on the Lake Wenatchee, Leavenworth and Cle Elum Ranger Districts. They all border the Alpine Lakes Wilderness. Access is provided by three major highways (I-90, U.S. 97, and U.S. 2) and a network of county and National Forest system roads. Trails provide access through most of the larger units.

C. Physiography and Soils

This area is made up of five separate areas, two of which are very small (less than 150 acres), two are about 300 acres in size, and the fifth is fairly large (several sections). Most of the bedrock is granitic and the valleys have all been glaciated. The soils along the lower slopes have formed in glacial till. Most of the slopes are steep to very steep. The upper areas are poorly vegetated and rock outcrops are common.

Elevations range from about 1,300 to 7,000 feet. The soils that have formed in glacial till are moderately deep and are moderately productive. The till soils account for about 20 percent of the soils. Nearly 70 percent of the soils have formed in granitic materials. These soils occupy the upper slopes. They range in depth from a few inches to about 50 inches; the mean being about 33 inches. These soils are moderately productive. The balance of the area is made up of several different rock types, but their extent is small. Most of these soils have a thin cap of volcanic ash on them.

D. Climate

These lands lie within a range of 30 to 80 inch precipitation zone with an estimated 65 percent of the moisture falling as snow.

E. Vegetation

As this includes scattered parcels all around the east side of the Alpine Lakes Wilderness, vegetation is variable. Low elevation areas in such places as Tumwater Canyon and Icicle Creek are characterized by scattered ponderosa pine, Douglas-fir, and grand fir pockets interspersed with granitic rock boulders. Denser stands of Douglas-fir, grand fir, and western larch are typical of mid-elevation areas. Upper elevations are typified by alpine fir and lodgepole pine. Bigleaf maple is a very common hardwood species in the driest locations with black cottonwood and quaking aspen characteristic of wet areas.

Recent fires, such as the Eightmile fire, were seeded to grasses and provide abundant forage for wildlife. Tentatively suitable acres for timber management are 34 percent of the total area.

F. Current Uses

The current use is for dispersed recreation. The major activities are hunting, hiking, and mountain climbing.

The area contains the following kinds and amounts of Recreation Opportunity Spectrum (ROS) Classes:

<u>ROS Class</u>	<u>Acres</u>
Semi-Primitive Non-Motorized (SPNM)	32,818
Semi-Primitive Motorized (SPM)	11,575

There are approximately 40 miles of trail in the areas all closed to motorized use.

G. Appearance and Surroundings

The area has moderate visual variety of land form, vegetation, rockform, and waterforms (lakes and streams). Most of the areas are steep sideslopes with moderate to heavy timber, especially stream bottoms and north aspects.

The area is primarily viewed as foreground and middleground views from trails and forest roads and in some areas Interstate and cross-state highways. Views from most major highways and forest roads are middle ground.

The areas are all bounded by Alpine Lakes Wilderness on one side.

H. Attractions

There are few unique features in the area, although there are several areas that have striking scenic qualities such as Tumwater Canyon and Icicle Canyon.

II. CAPABILITY-WILDERNESS CHARACTERISTICS

A. Manageability and Boundaries

As mentioned before, all of these areas border the existing Alpine Lakes Wilderness. Some of the smaller pieces would be hard to define with boundaries and maps; however, some of the larger blocks such as Icicle Ridge would be easy to locate on a map and easy to manage.

B. Natural Integrity

These roadless area blocks were not considered for wilderness in 1984. Most of the smaller blocks have forest roads and timber harvest units adjacent to them. Trail systems run through most of the larger units; however, motorized use is not allowed on any of the trails currently.

C. Natural Appearance

Sights and sounds of human habitation are evident from most of the units; however, some of the larger units do have enough land base to provide a feeling of naturalness and a departure from human development and activity.

D. Opportunities for Solitude

Opportunities for solitude are good in the larger blocks. There are lesser opportunities in the smaller units, due to closeness to roaded areas in most instances.

E. Opportunities for Primitive Recreation

Opportunities for primitive recreation experiences are good in most areas, again based on size of unit and nearness to roaded segments. There are excellent opportunities for big game hunting, hiking, horse camping, and mountain climbing.

F. Challenging Experiences

Some of the units offer excellent opportunities for mountain climbing on some of the best rock in the Cascade range. Many of the popular climbing routes are within these units, especially Icicle and Tumwater Canyons.

G. Special Wildlife Features

There are no known bald eagle or peregrine falcon nest sites or grizzly bear dens within the areas.

H. Historical and Scientific Study

There are no special or unique opportunities for outdoor education and scientific or historic study in the area which cannot already be found in the existing wilderness on the Forest.

II. RESOURCES AND POTENTIALS

A. Recreation

The area has potential value for unroaded types of recreation activities. Estimated carrying capacity by ROS Class is as follows:

ROS Class	Capacity in Potential Recreation Visitor Days Per Year
SPM	34,700
SPNM	32,800
TOTAL	67,500

B. Wildlife

Big game species such as elk, mule and black tail deer, and black bear are found, as well as occasional mountain goat on some of the units. Blue grouse, ruffed grouse, and fool hen are among the game birds found in the area.

C. Fish

These units encompass only small portions of stream systems. There are native cutthroat and rainbow trout in some of the larger streams. No anadromous fish use these streams although there is anadromous fish activity downstream.

D. Water

Water is of prime importance from these lands as well as from wilderness. Water for irrigation is much more significant on the east side of the Cascades. The critical source of the water is a narrow band along the east side of the Cascade Range above 4,500 feet in the 30-inch average precipitation range within which most of these units lie. Domestic water is also partially provided from these lands along with wilderness lands.

E. Livestock

These roadless area units have no commercial livestock grazing at present. One segment near Jim Hill Mountain on the Lake Wenatchee Ranger District lies within the Whitepine Grazing Allotment and a portion of Canal-Fortune Creek Allotment in the Cle Elum River drainage. Several of the parcels lie within Recreation Stock Allotment boundaries.

F. Timber

This areas contains 14,968 acres of tentatively suitable forest land. Stand volume and other data are as follows:

Ecotype	Stand Size	Acres	Estimated Standing Volume	
			MMBF	MMCF
Wet	Mature	6,127	173.6	31.9
Wet	Immature	6,404	115.2	21.1
Wet	Seedlings and Saplings	954	---	---
Wet	Bare Ground	127	---	---
Dry	Mature	551	6.9	1.3
Wet	Immature	741	7.3	1.3
Wet	Seedlings and Saplings	64	---	---
Wet		14,968	303.0	55.6

The estimated maximum biological potential contribution to the long-term sustained yield is 4.9 MM Bd. Ft., or 0.9 MM cubic feet, per year.

G. Minerals

Because of the widespread location of these parcels, their geology varies considerably. Primarily it consists of Tertiary sedimentary and volcanic rocks, pre-Tertiary metamorphic rocks and granitic rocks of Mesozoic age. Based upon the evaluation of the Alpine Lakes area itself, which was conducted by the U.S. Geological Survey and U.S. Bureau of Mines, it is surmised that portions of the area do have a "probable" potential for the occurrence of copper, gold, silver, and molybdenum resources. A large portion of the area lies within the Blewett, Cle Elum, and Mineral Creek mining districts. These districts have a long history of gold, silver, and lead production, and have a potential for the future production of nickel. The Northwest Mining Association indicates that the area has, in addition to numerous small occurrences, the following reported occurrences of a significant nature:

Mineral Creek, copper (T.22N.,R.13E., Section 5)

Cle Elum River, iron-nickel (T.22N.,R.16E., Section 8)

Pickwick, copper (T.23N.,R.15E., Sections 9 and 16)

Bureau of Land Management mining claim recordation data indicates that 231 mining claims have been located and recorded for lands lying within or immediately adjacent to the subject lands. The majority of these claims, however, have been located within T23N.,R.14E. to R.17E., which is generally within the Blewett mining district. The degree to which these claims have been explored, developed, and mined is not known.

Only a small southeast portion of the area has been classified "prospectively valuable" for coal and geothermal resources. However, little is known about the geothermal resource potential, and based upon available information any coal resources would not be of commercial value. Even though none of the area is classified "prospectively valuable" for oil and gas, the area is encumbered by four oil and gas leases. Based upon available information, it is surmised that these applications were filed in speculative response to oil and gas exploration activities being conducted on lands lying south and east of the Wenatchee N.F.

Most of the parent material is granite in these units and have had little interest from the mining segment. There are a few mining claims recorded in these areas but little actual mining is being done. The U.S. Geological Survey and the U.S. Bureau of Mines completed a geologic and mineral study of the lands within the Alpine Lakes Management Unit. The report was made available for public inspection in October 1973.

H. Cultural-Historical

Few cultural resources are known within any of the Alpine Lakes adjacent roadless areas, and the potential for the identification of new sites is moderate to low. A more complete discussion of the cultural resources, including suggestions for management direction, is presented within the Alpine Lakes Management Plan. This direction would apply to all cultural sites identified within the Alpine Lakes adjacent roadless areas.

I. Land Use

There are no special land uses in these areas.

J. Fire

Annual fire occurrence is low to moderate. Fuel loadings are heavy at lower elevations and within scattered meadows and alpine clumps of trees at higher elevations. Fire history indicates mostly small, isolated fires have occurred with some periodic large fires.

K. Insects and Disease

Heavy spruce budworm damage occurred in much of this area from 1974-1977. Aerial spray treatment was completed in 1977 and no evidence of defoliation has appeared since.

A recent biological survey in portions of the Icicle adjacent to the Alpine Lakes found pest damage in this area "well above average for the region." (Goheen, 1985)

Phellinus weirii, root rot, Douglas-fir mistletoe, and beetles have combined with the spruce budworm to kill up to 75 percent of the trees in some stands. These pest problems are posing danger to immediately adjacent stands. Removal of the high pest problem species of grand fir and Douglas-fir through clearcutting harvests is recommended. Replanting with pines should reduce the problems present.

L. Private Lands

Most of the large parcels have private lands involved, such as the lands in Icicle, Nason Creek, Cle Elum, and Kachess drainages. In some instances, these blocks are checkerboard with every other section being private. Private lands total 19,970 acres.

IV. NEED

A. Nearby Wilderness and Other Roadless Areas

All of these units border the Alpine Lakes Wilderness.

B. Distance from Population Centers

The areas are reachable within one to three hours from population centers such as Seattle-Tacoma, Yakima, Tri-Cities, and Wenatchee.

C. Need for Ecosystem Representation

There are no special or unique ecosystems within these areas that are not already represented in the Alpine Lakes Wilderness.

D. Interest by Proponents, Including Congressional

E. Public Input

F. Other Public Involvement

Interest by proponents, public input, and other public involvement are discussed on pages 113 through 119 in the 1980 Final Environmental Impact Statement for the Alpine Lakes Management Plan which is available for review in the Wenatchee National Forest Supervisor's Office. Comments covered a broad range of subjects including more restrictive management, four-wheel-drive use, road construction, timber sales, campground development, and land allocations. There were no comments addressed specifically to this area.

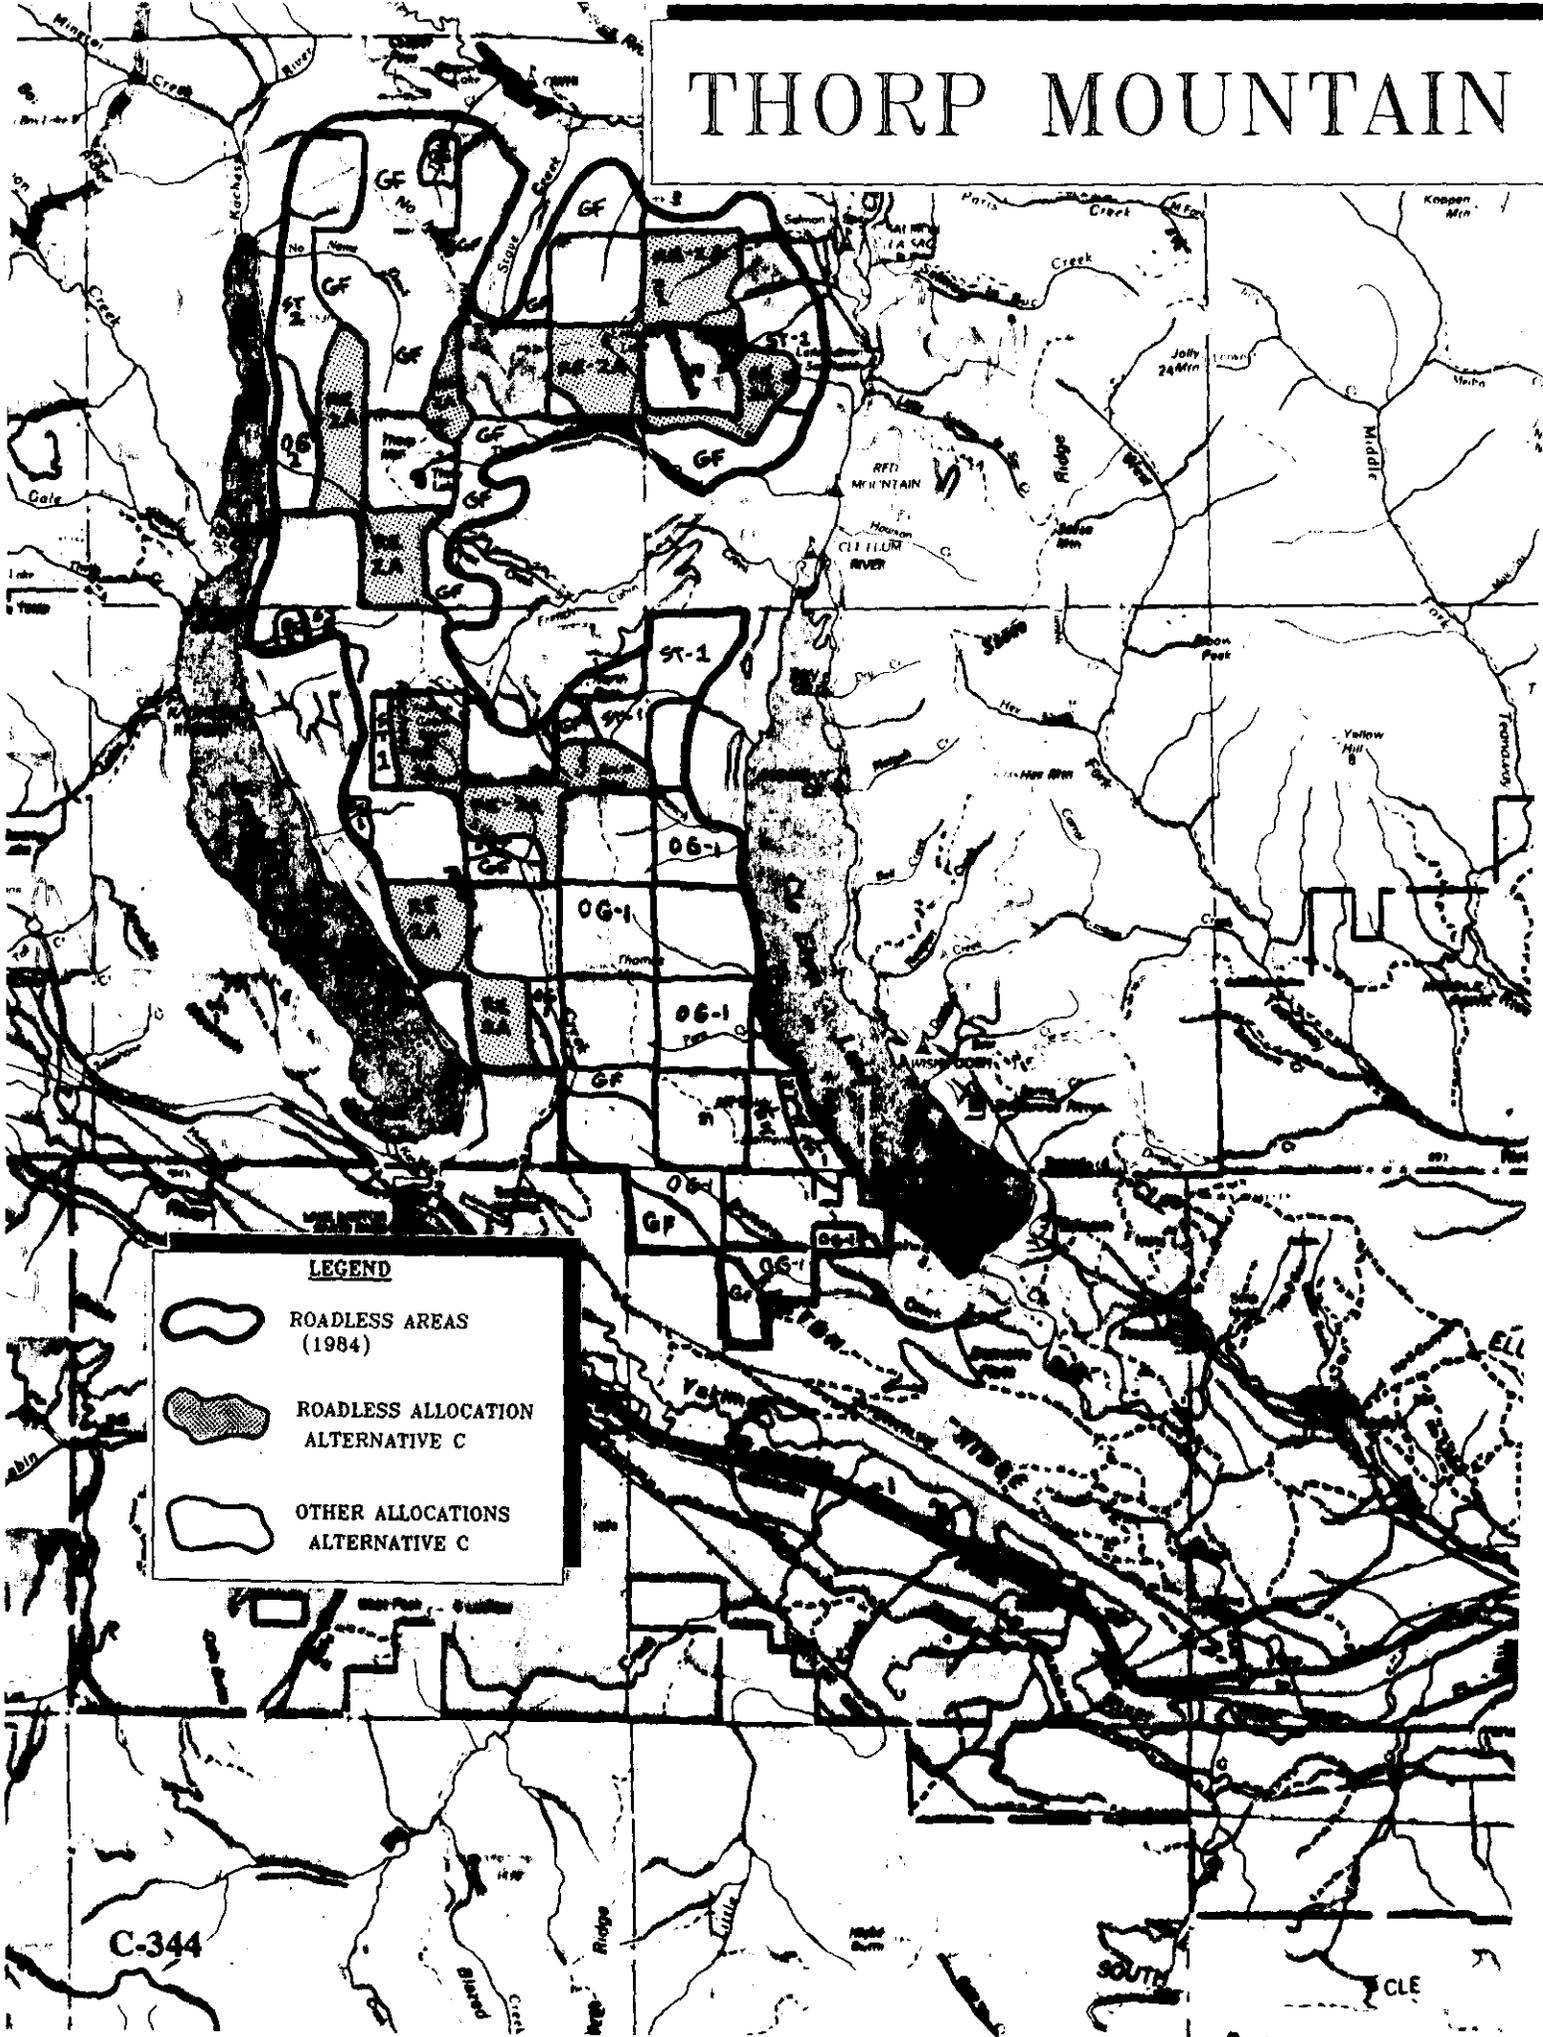

V. ENVIRONMENTAL CONSEQUENCES

A. Environmental Consequences Associated with the Alternatives

As the management of this area will be that directed by the Alpine Lakes Management Plan and will not change by the alternatives being considered under this planning process, a full analysis is not being made here.

The environmental effects associated with the implementation of the selected plan for the Alpine Lakes Management Area are discussed by resource on pages 86 through 90 of the 1980 Final Environmental Impact Statement which is available for review in the Wenatchee National Forest Supervisor's Office.

-  OTHER ALLOCATIONS ALTERNATIVE C

C-344

SOUTH

CLE

THORP MOUNTAIN ROADLESS AREA

Gross Acres: 27,857

Net Acres: 15,667

I. GENERAL INFORMATION

A. History

This area was analyzed under the Alpine Lakes Planning Process.

It is being addressed due to new criteria of public interest expressed in the roadless areas remaining roadless. Management direction for this area is currently directed by the Alpine Lakes Management Plan.

B. Location and Access

This area is within Kittitas County and lies within the Cle Elum Ranger District, between Lake Cle Elum and Lake Kachess. It lies adjacent to the Alpine Lakes Wilderness. Access is primarily via the Cle Elum Valley, French Cabin Creek, and Cooper Pass road systems.

C. Physiography and Soils

This area is characterized by steep slopes and hard bedrock materials. Glaciation has had a major role in shaping the surrounding areas, as well as part of this roadless area itself.

Elevations range from 2,400 to almost 6,000 feet. About 60 percent of the soils have formed in very hard sandstone and granitic parent materials. Glacial till soils account for about 30 percent of the area, and about 20 percent of the area soils have formed in schist materials. There are also a few areas of pyroclastic soils. Most of these soils are non-sticky and non-plastic and generally have a high bearing strength. They are all moderately productive and about 70 percent of the area is well suited to timber production. Most of the forested soils are moderately deep and well drained.

D. Climate

Annual precipitation in this area is estimated to be 45 inches, with approximately 50 percent falling as snow. Snow depth is estimated to average 80 inches.

E. Vegetation

Sixty-five percent of this area is tentatively suitable forest land, which consists of the ridge between Lake Cle Elum and Lake Kachess. It has a mostly dense conifer cover with Douglas-fir, Pacific silver fir, noble fir, and western hemlock the most common species. Lodgepole pine and western white pine occupy rocky areas such as Red Mountain.

Recent prescribed burning on the Nanny timber sale has demonstrated the potential of using fire to stimulate new browse vegetation for deer, elk, and mountain goats. Mountain maple sprouts were heavily used by big game immediately after burning on this sale on the boundary of this roadless area.

F. Current Uses

The current use is for dispersed recreation on National Forest lands and commercial timber harvest on private lands.

The area contains the following kinds and amounts of Recreation Opportunity Spectrum (ROS) Classes:

<u>ROS Class</u>	<u>Acres</u>
Semi-Primitive Non-Motorized (SPNM)	3,329
Semi-Primitive Motorized (SPM)	12,338

There are 32 miles of trail in the area, 28 miles of which are open to motorized travel. Trail management on the area is made difficult due to the checkerboard ownership.

G. Appearance and Surroundings

The area has moderate visual variety of land form, vegetation, rock form, and water form (lakes and streams). The ridgetops have moderate to high visual variety.

The area is steep, with tree covered mid and lower slopes, and open grassy or rocky upper slopes and peaks. Vegetation is sparse on the upper slopes.

The area is primarily viewed as foreground and middleground from Lake Kachess and Lake Cle Elum. The ridgetops and higher peaks are also viewed as background from trails on the upper slopes and ridges.

The Thorp Mountain area is bounded by the Kachess River Valley and Lake Kachess on the west. It is bounded by the Cooper River Valley on the north, and by the Cle Elum River Valley and Lake Cle Elum on the east. The southern tip of this area extends to Domerie Flats and within 1-1/2 miles of the I-90 highway.

H. Attractions

Major attractions within the area are Thorp Mountain and Thorp Mountain Lookout, Thorp Lake, Red Mountain, Little Joe Lake, French Cabin Basin, and Domerie Peak.

II. CAPABILITY-WILDERNESS CHARACTERISTIC

A. Manageability and Boundaries

The west boundary is parallel to Kachess Lake and River; the north and east boundaries meander somewhere parallel to the Cooper and Cle Elum Rivers with the south ends of the west and east lines pinching together on Easton Ridge.

Most of the boundaries do not follow clearly defined physical features.

B. Natural Integrity

There are plans that will increase the impact from human activity along the northern portions of the area from road building, logging, and mining. The logging would be on both private and National Forest land. The mining is small in scale but proposals are for a road and larger scale ore removal.

There are six trails within the area. There is a lookout on Thorp Mountain and a lookout site on Red Mountain.

C. Natural Appearance

The area is long and narrow and nearly broken into two segments. The southern third of the area is the only place a person could be out of sight and sound of human activities.

D. Opportunities for Solitude

For the most part there are few chances for solitude in this area. The only area would be along Silver Creek which receives light use, except during hunting season.

E. Opportunities for Primitive Recreation

There are approximately 32 miles of trail within this area. Although about one-half of these trails are within sight and sound of other human activities, there are many opportunities for primitive recreation. Some of these are hiking, horseback riding, camping, hunting, and viewing scenery. There are lesser opportunities for fishing and berry picking.

F. Challenging Experiences

There are trailless areas that offer opportunities for cross country hiking challenges. The winter season offers opportunities for snow camping, snowshoeing, skiing, and other winter survival pursuits.

G. Special Wildlife Features

Spotted owls have been sighted near the north boundary of the area. It is not known if any are nesting within the area.

Sensitive wildlife species are listed in Chapter III. Their specific population and distribution are presently unknown.

H. Historical and Scientific Study

There are no special or unique opportunities for outdoor education and scientific or historic study in the area which cannot already be found in the existing wilderness of the Forest.

III. RESOURCES AND POTENTIALS

A. Recreation

The area has potential value for unroaded types of recreation activities. Estimated carrying capacity by ROS Class is as follows:

ROS Class	Capacity in Potential Recreation Visitor Days per year
Semi-Primitive Non-Motorized (SPNM)	3,300
Semi-Primitive Motorized (SPM)	37,000
TOTAL	40,300

B. Wildlife

The area serves as summer habitat for deer and elk, and provides habitat for a variety of non-migratory game and non-game animals.

C. Fish

There are two streams in this area that support trout: Domerie Creek and Silver Creek. Both streams are small and the amount of fish taken is small. Fishing is a minor activity.

The streams in this area include some of the headwaters for the Yakima River and, therefore, are of some importance to anadromous fish production.

D. Water

Domerie Creek is the water source for the town of Roslyn. Silver Creek is the water source for the town of Easton. Three applications to study hydropower potential have been submitted to the Federal Energy Regulatory Commission for streams that headwater within this area. They are Silver Creek, French Cabin Creek, and Thorp Creek.

E. Livestock

A portion of the Cooper-French Sheep and Goat allotment is within this area. This allotment is for 681 AUM's of sheep.

There is little potential for expansion of this allotment within the area.

F. Timber

This area contains 10,218 acres of tentatively suitable forest land. Other data on the existing suitable forest land is:

Ecotype	Stand Size	Acres	Estimated Standing	
			Volume MMBF	MMCF
Wet	Mature	5,809	164.6	30.2
Wet	Immature	3,456	62.2	11.4
Wet	Seedlings and	254		
Wet	Saplings			
Wet	Bare Ground	339		
Dry	Mature	360	4.5	.8
		10,218	231.3	42.4

The estimated maximum biological potential contribution to the long-term sustained yield is 3.3 MM Bd. Ft., or 0.6 MM Cu. Ft., per year.

G. Minerals

This area is primarily underlain by pre-Tertiary and Tertiary metamorphic and volcanic rocks; however, a small portion of the area near South Peak is underlain by Tertiary-aged sedimentary rocks. The area has not been investigated in detail by the U.S.G.S. or the U.S.B.M., but available references indicate the area has reported occurrences of copper, nickel, molybdenum, gold, and silver. Based on studies conducted on adjacent lands, the subject area can be inferred to have a "probable" mineral resource potential.

According to the Northwest Mining Association, Sections 29 and 30, T. 22N., R.14E. appear to have a porphyry copper deposit which they feel could have a "major" potential for future development. The deposit has not been thoroughly explored, and its production would require major multi-year exploration and development efforts. In the absence of a national emergency or a substantial change in the present economic conditions, however, it is unlikely that the deposit would be brought into production within the next 10 to 20 years.

The entire area is classified prospectively valuable for coal resources by the U.S.G.S., but the area is not known to contain a deposit of commercial value. Even though the area is encumbered by an oil and gas lease, it has not been classified prospectively valuable for oil and gas, nor has it been classified prospectively valuable for any other leasable commodity. Bureau of Land Management mining claim records indicate that 28 mining claims have been located within the area, mainly around the Red Mountain mineralized zone. It is assumed that these claims have been located for the copper and gold resource potential of the area, however, the degree to which these claims have been explored, developed, and mined is not known.

H. Cultural-Historical

Thorp Mountain lies between two areas of concentrated prehistoric use (Salmon La Sac to the east and Lake Kachess to the west), and probably experienced at least some transient use as a consequence. There are no known archaeological sites in the area, however, and surveys conducted on adjacent lands to the south have failed to locate any.

Historic uses include trapping; historic sites are the Red Mountain Lookout (1932-abandoned 1948), the existing Thorp Mountain Lookout (on private land), and the faint remains of one mining-related cabin. The entire locality was included within sheep allotments from the late 1800's until the 1920's, and some remnants of this use may still exist.

I. Land Uses

There are no special use permits in effect in this area.

J. Fire

Annual fire occurrence is low to moderate, generally ignited by lightning. Fuel loadings are light to heavy but broken by openings such as bare ridgetops.

K. Insects and Disease

Heavy western spruce budworm damage occurred in Thorp Creek and Domerie Creek drainages from 1974-1977. Aerial spray treatment for budworm was accomplished in 1977 and no evidence of damage has been apparent since then. Western white pine blister rust and mountain pine beetles are scattered through the area. Dwarf mistletoe is locally heavy in Douglas-fir. Grand firs and Douglas-fir stands are infected by root rots, especially in the Branch Creek area.

L. Private Lands

There are 12,190 acres of private land within the area, belonging to Burlington Northern Railroad Company. Exchange possibilities are excellent as these lands are included in a master exchange agreement with Burlington Northern.

IV. NEEDS

A. Nearby Wilderness and Other Roadless Areas

The Alpine Lakes Wilderness is one to two miles north of the Thorp Roadless area. The Teanaway Roadless area boundary is across the Cle Elum Valley approximately two miles to the east.

B. Need for Ecosystem Representation

There are no unique or special ecosystems within the area in need of representation through roadless classification.

C. Distance from Population Centers

The area is one to three hours driving time from population centers such as Seattle, Ellensburg, and Yakima.

D. Interest by Proponents, Including Congressional

E. Public Input

F. Other Public Involvement

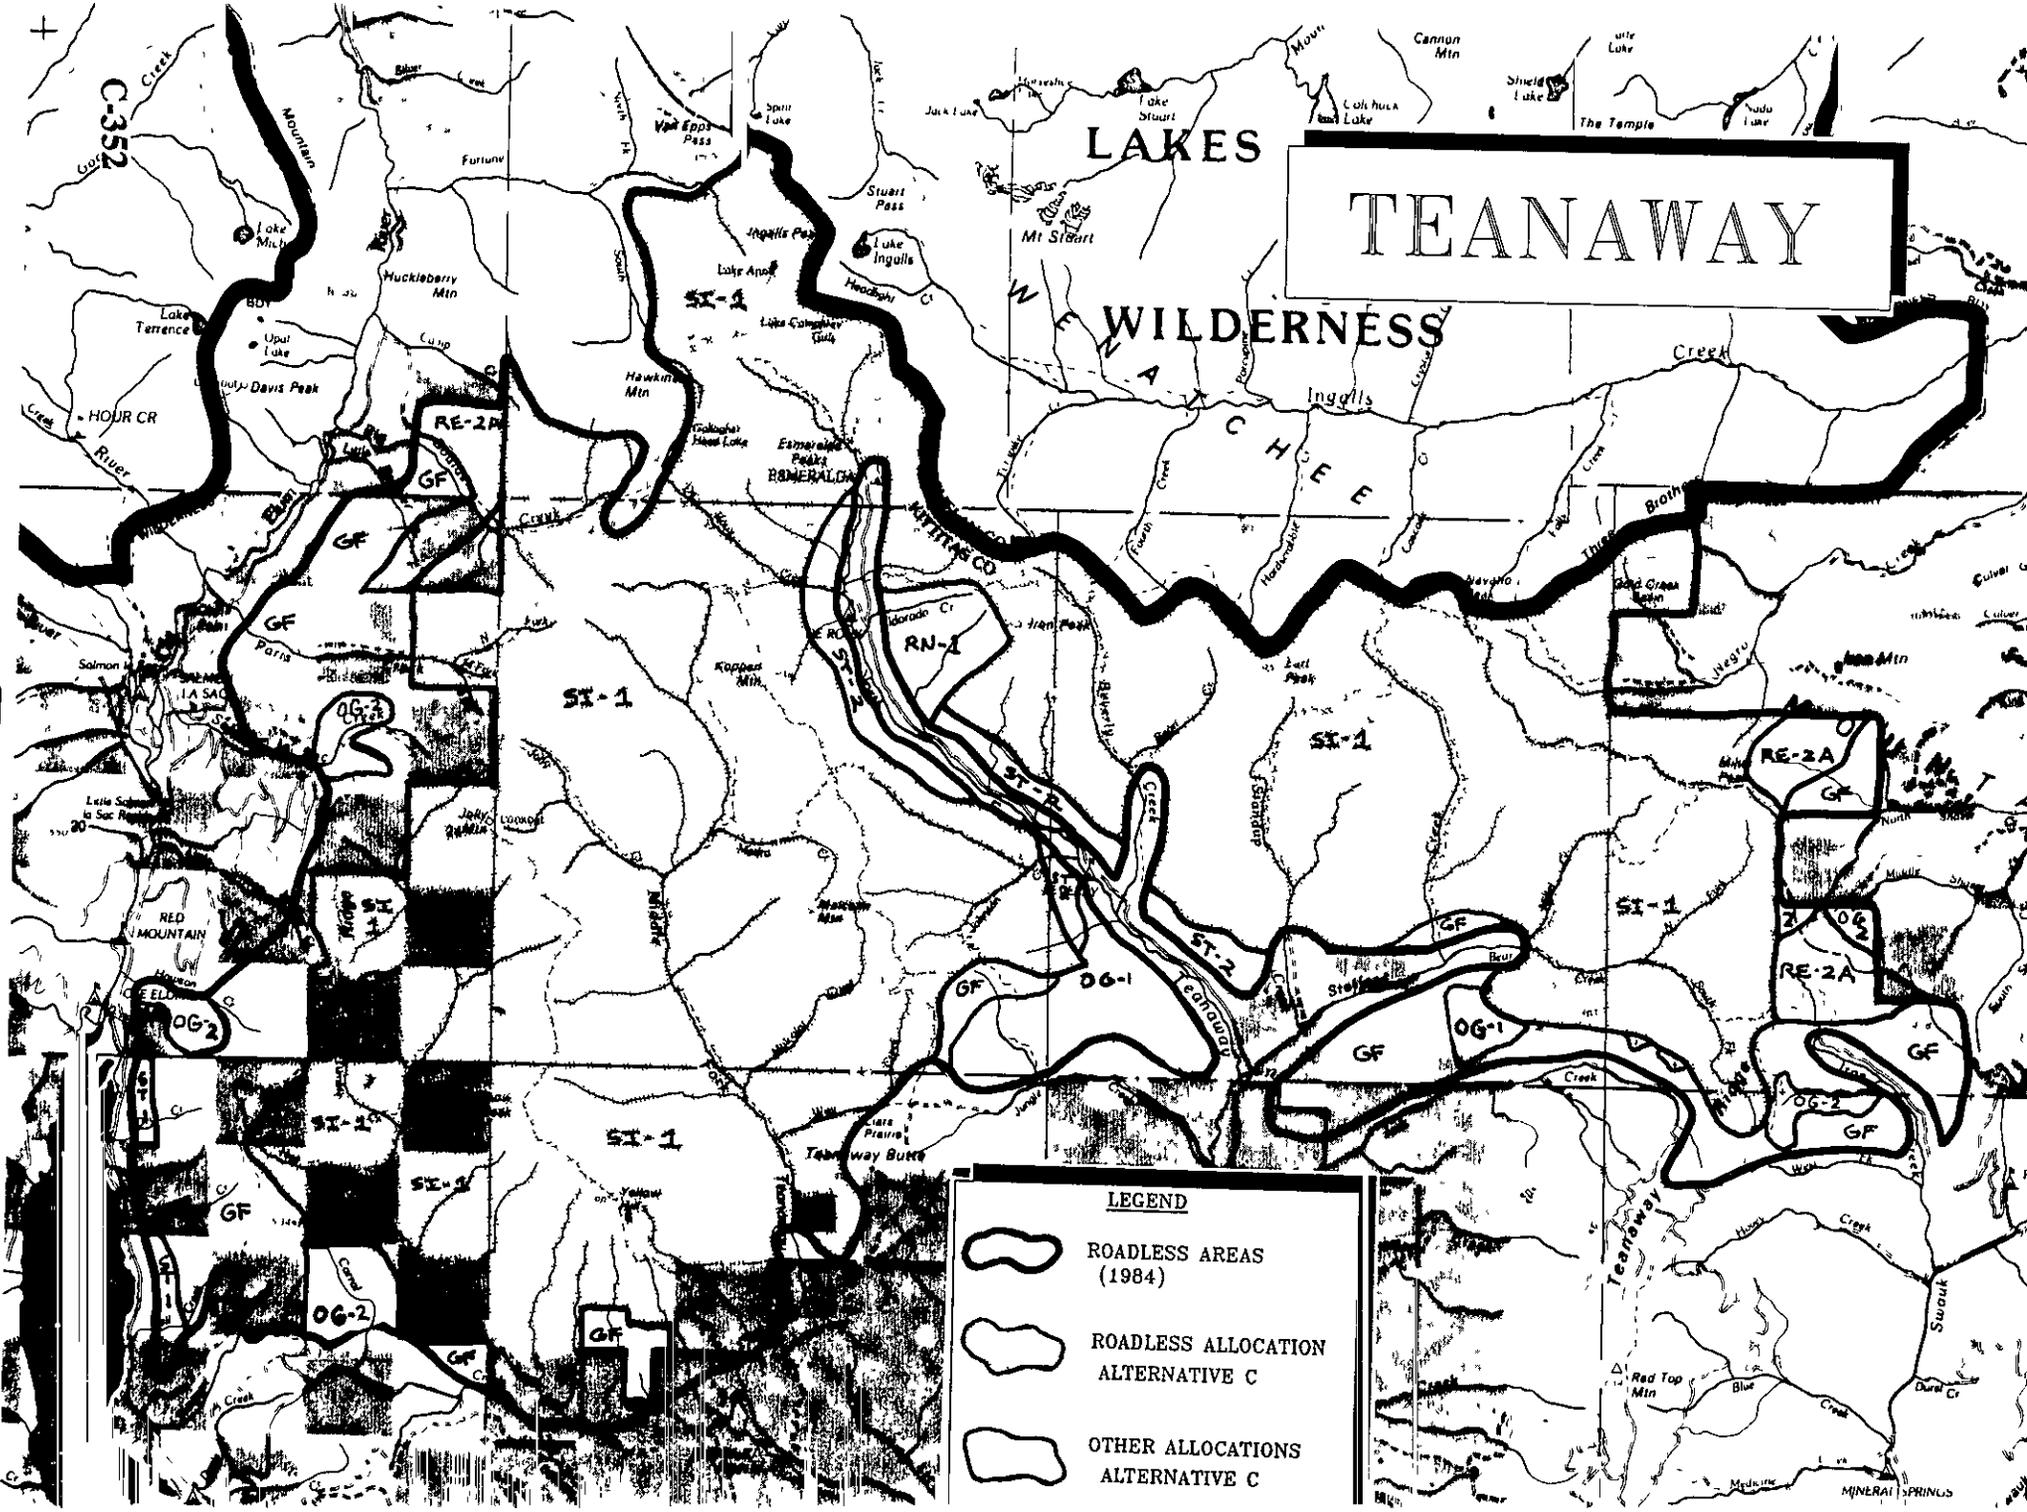

Interest by proponents, public input, and other public involvement are discussed on pages 113 through 119 in the 1980 Final Environmental Impact Statement for the Alpine Lakes Management Plan which is available for review in the Wenatchee National Forest Supervisor's Office. Overall comments covered a broad range of subjects including more restrictive management, four-wheel-drive use, road building, timber sales, campground development, and land allocations. There were no comments addressed specifically to this area.

V. ENVIRONMENTAL CONSEQUENCES

A. Environmental Consequences Associated with the Alternatives

As the management of this area will be that directed by the Alpine Lakes Management Plan and will not change by the alternatives being considered under this planning process, a full analysis is not being made here.

The environmental effects associated with the implementation of the selected plan for the Alpine Lakes Management Area are discussed by resource on pages 86 through 90 of the 1980 Final Environmental Impact Statement which is available for review in the Wenatchee National Forest Supervisor's Office.

-  OTHER ALLOCATIONS ALTERNATIVE C

TEANAWAY ROADLESS AREA

Gross Acres: 77,466

Net Acres: 66,293

I. GENERAL INFORMATION

A. History

The area was inventoried and analyzed under the Alpine Lakes planning process. It is currently being addressed due to the new criteria of public interest being expressed in roadless areas. Management direction for this area is currently being directed by the Alpine Lakes Management Plan.

B. Location and Access

The area is within Kittitas County and lies within the Cle Elum Ranger District. It is adjacent to the Alpine Lakes Wilderness. The primary access is by the North Fork Teanaway Road which bisects the area and terminates within three-quarter mile of the wilderness boundary. Other roads access the perimeter of the area: from the Cle Elum Valley, from the West and the Middle Forks of the Teanaway, and from The Stafford Creek, Iron Creek, and Jack Creek Roads. The area is crisscrossed by numerous trails including Westfork and Middle Fork Teanaway Trails, Yellow Hill Trail, Johnson Medra Trail, Boulder De Roux Trail, Beverly Bean, Standup, Miller Bear, and County Line Trails, plus several shorter trails.

C. Physiography and Soils

This area is characterized by a complex geologic pattern. The higher slopes bordering Ingalls Creek are made up mostly of serpentine materials and much of the area has bare exposed slopes (none or little vegetative cover). Between Lake Cle Elum and the North Fork Teanaway River, the high ridges are made up of very hard sandstone and granitic rock types. Below these rock types, the topography tends to broaden out. Here the area is dominated by Chumstick sandstone materials that have many pyroclastic and basalt dikes intermixed.

Elevations range from about 2,400 to more than 7,000 feet. Roughly 60 percent of the area is composed of soils that have formed in the Chumstick sandstone parent materials. These soils range in texture from sandy loam to sandy clay loam. They usually become sticky and plastic when wet, and the surface often becomes very slippery even during light rains. About 15 percent of the area is made up of the very hard sandstone and granitic parent materials. Soils that have formed in these materials tend to be non-sticky and non-plastic. They usually are not slippery and have good bearing strength. Serpentine soils make up about 11 percent of the area. They are chemically unbalanced, so most vegetative types do not do well on them. These soils tend to be very erosive. Except for the serpentine soils, they are all moderately productive. Most are well drained and moderately deep.

D. Climate

The Teanaway Roadless Area lies within the 40 to 80 inch precipitation zone with an estimated 60 percent of the moisture occurring as snow. Snow depths are estimated to range from 4-15 feet.

E. Vegetation

This area contains 40 percent tentatively suitable forest land. Most of the timbered area is along stream bottoms and north slopes. Past fires and shallow soils contribute to the open areas dominated by shrubs including ceanothus, bitter cherry, willow, and numerous forbs and grasses. Many of these open areas are gradually being encroached upon, primarily by Douglas-fir and grand fir. Subalpine fir and lodgepole pine are common at higher elevations.

F. Current Uses

This area is used for dispersed recreation. It is predominantly classified as the Teanaway Special Area which is protected for its unique and natural conditions. The Eldorado Research Natural Area is also located in this roadless area.

The area contains the following kinds and amounts of Recreation Opportunity Spectrum (ROS) Classes:

<u>ROS Classes</u>	<u>Acres</u>
Semi-Primitive Non-Motorized (SPNM)	22,790
Semi-Primitive Motorized (SPM)	43,503

There are approximately 147 miles of trail, 70 of which are open to motorized use.

G. Appearance and Surroundings

The area has a high variety of landforms, vegetation, and rockforms. The area ranges from rounded, broad ridgetops to steep, rocky rugged ridges. The hillsides and side slopes are steeply broken. The streams have dendritic patterns of drainage. Stream bottom vegetation is dense. Vegetation is sparse near the ridgetops with a broken, open mixed conifer vegetation pattern on the side slopes.

The area is primarily viewed as background except from the trails that pass through it. From trails the area is viewed as foreground and middle ground. The Teanaway River Corridor is classified scenic forest in the foreground and middle ground.

H. Attractions

The main features of this area are Engles Peak, Lake Ann, Gallagher Lake, and the line of peaks in the Wenatchee Mountains which makes up the county line between Kittitas and Chelan Counties. These include Iron, Earl, Navaho, and Miller peaks.

II. CAPABILITY-WILDERNESS CHARACTERISTICS

A. Manageability and Boundaries

The north boundary is the south boundary of the Alpine Lakes Wilderness on the crest of the Wenatchee Mountains. The remainder of the boundary is a meander line that takes in the Teanaway drainage and the southeastern portion of the Cle Elum drainage, excluding road corridors.

Except for the wilderness boundary, the boundaries do not follow clearly defined physical features.

B. Natural Integrity

The impact of past human use is evidenced by 147 miles of trail, 15 miles of abandoned mining roads, 3 mining complexes, 6 cabin sites, and 3 lookout sites. About 70 miles of trail are open to motorcycle use. The mining complexes and mining related cabins have been abandoned for many years. The lookouts were burned during the mid 1960's.

C. Natural Appearance

The Teanaway Roadless Area is large enough and the topography is such that persons visiting the area may seek out areas that appear natural and away from ordinary human activity and development.

It is, however, possible to view distant roads and timber harvest activities from the ridge and mountain tops.

D. Opportunities for Solitude

This area offers many opportunities, with the exception of the North Fork Teanaway Road; the area is essentially a trapezoid, 19 miles wide (east-west) and 13 miles deep (north-south). Two principal drainages are roadless (West and Middle Forks of the Teanaway) while the North Fork of the Teanaway has a road along the river. Most of the drainages and ridges have trails.

E. Opportunities for Primitive Recreation

There are many opportunities, such as hiking, horseback riding, camping, hunting, fishing, viewing scenery, and mountain climbing.

F. Challenging Experiences

There are several peaks and rock cliffs to offer challenges to rock climbers. There are trailless areas for cross-country enthusiasts. There are also opportunities for winter survival and other wilderness challenges.

G. Special Wildlife Features

Spotted owls have been sighted in Jungle Creek near the boundary of the area. It is not known if any are nesting within the area.

Sensitive wildlife species are listed in Chapter III. Their specific population and distribution are presently unknown.

H. Historical and Scientific Study

Most of the proposed Eldorado Research Natural Area is within this area. It contains unique combinations of plant groups and geology.

There are no other special or unique opportunities for outdoor education and scientific or historical study that cannot already be found in the existing wilderness on the Forest.

III. RESOURCES AND POTENTIALS

A. Recreation

The area has potential value for unroaded types of recreation activities. Estimated carrying capacity by ROS Class is as follows:

ROS Class	Capacity in Potential Recreation Visitor Days Per Year
SPNM	22,800
SPM	103,500
TOTAL	126,300

B. Wildlife

The area serves as summer habitat for deer and elk and provides habitat for a variety of non-migratory game and non-game animals.

C. Fish

There are six streams in this area that support trout: the West and Middle Fork Teanaway Rivers, Startup, Stafford, Miller and Bear Creeks. The two forks of the Teanaway River are the largest of these streams and present the only consistent fishing potential. The fish are mostly Eastern Brook Trout.

D. Water

There are no water related encumbrances or planned activities within the area.

E. Livestock

Portions of the Corral-Fortune Sheep and Goat, and the Stafford Cattle and Horse allotments are within this area. The Stafford allotment is for 70 AUM's of cattle every other year. The Corral-Fortune allotment is for 1,044 AUM's of sheep. There is no potential for expansion of these allotments.

F. Timber

This area contains 26,775 acres of tentatively suitable forest lands. Other data on the existing suitable forest stands is:

Ecotype	Stand Size	Acres	Estimated Standing	
			Volume MMBF	MMCF
Dry	Mature	2,629	33 0	6.0
Dry	Immature	3,519	34 5	6.3
Dry	Mature	4,494	127 4	23.4
Wet	Immature	20,309	284 4	52 2
Wet	Seedlings and	297	---	---
Wet	Saplings			
Wet	Bare Ground	21	---	---
	TOTAL	26,775	479.3	87.9

The estimated maximum biological potential contribution of this area to the potential allowable harvest is 8.6 MM Bd. Ft., or 1.6 MM Cu. Ft., per year.

G. Minerals

This area is primarily underlain by Tertiary sedimentary rocks; however, the south 20 percent is also underlain by Tertiary volcanics while the northern 20 percent is underlain by both Mesozoic ultramafic rocks and volcanic rocks of pre-Tertiary age. This area has not been studied in detail by the U.S. Geological Survey and U.S. Bureau of Mines. Available information, however, indicates the area has reported occurrences of copper, iron, nickel, chromium, cobalt, gold, and silver. The area lies within the Cle Elum-Blewett mining districts and within the Blewett nickel-iron province. Under present conditions it appears that any gold related activity would be relatively small scale, and nickel-iron-chromium related activity will depend on improvements in extractive technology and on major changes in the worldwide supply/demand environment for these commodities. Even though present activity appears to be relatively minor, the Northwest Mining Association indicates the area contains, in addition to numerous small occurrences, the following deposits which have a "major" potential for future development:

Cle Elum River iron-nickel deposit (T.22N.,R.14E.,Section 2 and 3)

Negro Creek iron-nickel deposit (T.22N.,R.16E., Section 8)

The area does have a potential for the occurrence of deep-seated deposits, but this resource potential has not been explored. Bureau of Land Management recordation data indicates that 187 mining claims have been located within or immediately adjacent to the subject area. Many may have been located in speculative response to the on-going activity at the Cannon Mine near Wenatchee. The degree to which these claims have been explored, developed, and mined is not known.

A large portion of the area is classified by the U.S. Geological Survey as being "prospectively valuable" for oil and gas resources; however, it is encumbered by only one oil and gas lease. None of the area is classified "prospectively valuable" for any other leasable commodity.

H. Cultural-Historical

Prehistoric use of the Teanaway roadless area was likely. Annual huckleberry picking expeditions were made into the country above Paris Creek and Salmon La Sac as late as the 1920's, and hunting and huckleberry gathering were common in the Teanaway (particularly around Koppen Mountain). Intensive field survey would be required to determine prehistoric site distributions.

Historically, the area encompasses a large portion of the old Cle Elum Mining District as well as some spillover from the Blewett Mining District to the east. Mining sites are numerous and include such diverse components as cabins, campsites, equipment, wagon roads, workings, and three known mill sites. The area was also used for sheep grazing between the late 1800's and the 1920's. Some of the herder's camps from this time period are identifiable by carvings on nearby trees. Finally, the area includes the former sites of the Jolly Mountain Lookout (1936-1968) and the Teanaway Butte Lookout (1935-1968).

I. Land Use

There is a special use permit in effect for the Eldorado Research Natural Area. An Outfitter/Guide is operating in this area under a permit.

J. Fire

Annual fire occurrence is low to moderate; generally ignited by lightning. Fuel loadings are light to heavy but broken by streams and bare ridgetops.

k. Insects and Disease

The low elevation grand fir, Douglas-fir stands in Miller, Standup, and Stafford Creek were heavily defoliated by western spruce budworm in the 1970's. In 1975 a trial aerial spraying was conducted using Fenitrothion in this area. This was unsuccessful in killing the budworms present. However, trees were already weakened and bark beetles have finished killing large areas in several of these drainages. Mistletoe is also common in the Douglas-fir, with root rot killing both grand and Douglas-firs.

L. Private Lands

There are 11,172 acres of private lands within the area belonging to Burlington Northern Railroad. Exchange possibilities are excellent as these lands are included in a master exchange agreement with Burlington Northern.

IV. NEED

A. Nearby Wilderness and Other Roadless Areas

This area shares approximately 16 miles of common boundary with the Alpine Lakes Wilderness.

B. Distance from Population Centers

The area is approximately one to three hours driving time from areas such as Seattle, Yakima, and Wenatchee.

C. Need for Ecosystem Representation

There are no unique or special ecosystems within the area in need of representation through wilderness classification.

D. Interest by Proponents, Including Congressional

E. Public Input

F. Other Public Involvement

Interest by proponents, public input, and other public involvement are discussed on pages 113 through 119 in the 1980 Final Environmental Impact Statement for the Alpine Lakes Management Plan which is available for review in the Wenatchee National Forest Supervisor's Office. Overall comments covered a broad range of subjects including more restrictive management, four-wheel-drive use, road construction, timber sales, campground development, and land allocations. Four-wheel-drive use on this area was specifically commented upon.

V. ENVIRONMENTAL CONSEQUENCES

A. Environmental Consequences Associated with the Alternatives

As the management of this area will be that directed by the Alpine Lakes Management Plan and will not change by the alternatives being considered under this planning process, a full analysis is not being made here.

The environmental effects associated with the implementation of the selected plan for the Alpine Lakes Management Area are discussed by resource on pages 86 through 90 of the 1980 Final Environmental Impact Statement which is available for review in the Wenatchee National Forest Supervisor's Office

APPENDIX D

STANDARDS AND GUIDELINES FOR ALL ALTERNATIVES

A. INTRODUCTION AND PURPOSE

Standards and guidelines were developed to meet resource objectives and to provide for the protection of resources. They were developed concurrently with management strategies and prescriptions. The original standards, guidelines, and prescriptions were prepared before the Alternatives displayed in the DEIS were developed.

Between the DEIS and the FEIS, standards and guidelines were reviewed and revised based on public comment. Also, as a result of public comment, three new prescriptions were developed which include: a Mather Memorial Parkway Prescription, an Unroaded Wildlife Prescription, and an Unroaded Harvest Prescription. The revisions between the DEIS and the FEIS resulted in variations between alternatives that are identified and discussed below. The revised Standards and Guidelines and Management Area Prescriptions are found in Chapter IV of the Forest Plan and apply to Alternative C, the Preferred alternative.

B. SOURCE

The Standards and Guidelines were developed by the Interdisciplinary (ID) Team working as a team and not as individual specialists. The ID team used the Forest Service Manual, various handbooks, the Regional Guide for the Pacific Northwest Region, and research publications as sources of information. The Interdisciplinary Teams working on the Standards and Guidelines included the Wenatchee National Forest Management Group (Forest Supervisor, Staff Specialists, and District Rangers), Ranger District specialists, and biologists from Washington State Departments of Wildlife and Fish.

C. STANDARDS AND GUIDELINES WHICH ARE DIFFERENT FROM THE PREFERRED ALTERNATIVE

The Forest-wide Standards and Guidelines and the Management Area Specific Prescriptions in Chapter IV of the Forest Plan are applicable to all alternatives with the exceptions noted below.

ALTERNATIVE NC (NO CHANGE)

In order to display the no change alternative the only standards and guidelines which could apply without changing outputs and objectives were those contained in existing plans, which include:

The Alpine Lakes Management Plan - 1982

The Chelan Unit Plan - 1976

The Kittitas Unit Plan - 1979

The Naches Ranger District Multiple Use Plan - 1961

The Tieton Ranger District Multiple Use Plan - 1968

The Wenatchee National Forest Timber Management Plan - 1963 as amended

The Snoqualmie National Forest (Naches-Tieton Working Circle) Timber Management Plan - 1969 as amended

ALTERNATIVES B AND D

These alternatives do not contain the following land allocations and therefore the prescriptions do not apply:

EW-3, Unroaded Wildlife which will allow management of Big Game in an unroaded setting.

MP-1, Mather Memorial Parkway which does not allow scheduled timber harvest.

RE-4, Unroaded Timber Harvest which will allow timber harvest without roads, neither temporary nor permanent.

WS-1, Scenic River.

WS-2, Recreational River.

WS-3, Wild River.

ALTERNATIVES A, G AND H

These alternatives do not contain the following land allocations and therefore the prescriptions do not apply:

EW-3, Unroaded Wildlife which will allow management of Big Game in an unroaded setting.

MP-1, Mather Memorial Parkway which does not allow scheduled timber harvest.

RE-4, Unroaded Timber Harvest which will allow timber harvest without roads, neither temporary nor permanent

ALTERNATIVES E AND F

These alternatives do not contain the following land allocations and therefore the prescriptions do not apply:

EW-3, Unroaded Wildlife which will allow management of Big Game in an unroaded setting.

RE-4, Unroaded Timber Harvest which will allow timber harvest without roads, neither temporary nor permanent.

ALTERNATIVE J

This alternative does not contain the following land allocations and therefore the prescriptions do not apply:

EW-3, Unroaded Wildlife which will allow management of Big Game in an unroaded setting.

MP-1, Mather Memorial Parkway which does not allow scheduled timber harvest.

RE-4, Unroaded Timber Harvest which will allow timber harvest without roads, neither temporary nor permanent.

WS-1, Scenic River.

WS-2, Recreational River.

WS-3, Wild River.

The Alpine Lakes Management Area is held constant in all alternatives including this alternative, and prescriptions within that area are the same as other alternatives. The following prescriptions are unique to areas outside of the Alpine Lakes Management Area in Alternative J:

EW, Wildlife Winter Range and RM, Range Management will be combined and managed for deer, elk and mountain goat winter range and livestock summer range. Timber yield tables are similar to the GF, General Forest (shelterwood) Permanent and seasonal road closures will provide wildlife habitat security. Emphasis will be placed on maximizing forage for both livestock and big game benefit.

ST, Scenic Travel Routes outside of the Alpine Lakes Area will be modeled as general forest with a 400 foot zone along all paved county/forest roads and a 200 foot zone along all non-motorized trails with emphasis on a shelterwood or partial retention cutting system.

APPENDIX E

ASSESSMENT OF RIVERS AS TO THEIR ELIGIBILITY AND SUITABILITY FOR DESIGNATION UNDER THE WILD AND SCENIC RIVERS ACT

I. INTRODUCTION

The Wild and Scenic Rivers Act, as amended, was enacted by Congress to provide Federal protection for selected free-flowing rivers within the United States. During the initial preparation of the Draft Environmental Impact Statement (DEIS) and The Proposed Land and Resource Management Plan for the Wenatchee National Forest, a study of certain rivers on the Forest was undertaken to determine their potential eligibility and suitability for inclusion in the Wild and Scenic River System. At that time, the study was confined, with the exception of the Entiat drainage, to those rivers listed on the Nationwide Rivers Inventory, originally published by the Department of Interior in 1980, and updated in 1982. This inventory was developed to identify rivers which would, by virtue of their exceptional natural, cultural, scenic or recreation resources, qualify for further consideration for inclusion in the National Wild and Scenic River System. The Wenatchee, White and Chiwawa Rivers, and Icicle Creek were identified in the inventory as meeting these criteria. The initial Forest planning effort also included the Entiat River and two tributaries, in response to public interest expressed at that time.

As a result of both in-Service review and the analysis of comments received from the public during the comment period for the DEIS, the Forest Supervisor assigned an Interdisciplinary (ID) Team the task of making a reassessment of eligibility for all rivers on the Wenatchee National Forest. An ID Team was also assigned the task of completing a suitability analysis for the resulting eligible rivers. The results of these studies were published in 1988 as a supplement to and correction of the original Appendix E that was distributed with the Wenatchee National Forest DEIS.

The present Appendix E is a modification and expansion of the 1988 Supplement. Based on additional study, new information, and public response to the Supplement, adjustments have been made in the data presented, including changes in certain river segment classifications. One notable modification is in the status of the Waptus River, on the Cle Elum Ranger District, which was reexamined and found to be eligible and suitable for inclusion in the Wild and Scenic River System.

II. ELIGIBILITY PROCESS

Rivers identified for evaluation were included in the eligibility study if they met any of the following criteria:

1. They were identified in the Nationwide Rivers Inventory (NRI), published by the National Park Service in 1982.
2. They were identified by the public, and appeared to meet the criteria outlined in the joint Department of Agriculture/Department of Interior Final Guidelines for Eligibility, Classification and Management of River Areas.
3. They were identified through in-Service study, had characteristics similar to the rivers identified in the NRI, and appeared to meet the criteria of the joint agency guidelines.

The list of rivers meeting the above criteria and a notation as to how they were identified are shown in Table E-1 below.

TABLE E-1
RIVERS CONSIDERED FOR ELIGIBILITY

RIVER	HOW IDENTIFIED
American	Public Interest
Bumping	Public Interest
Chiwawa	Nationwide Rivers Inventory
Cle Elum	Public Interest
Cooper	Forest Inventory
Entiat	Public Interest
Icicle Creek	Nationwide Rivers Inventory
Kachess	Forest Inventory
Little Naches	Public Interest
Little Wenatchee	Public Interest
Mad	Public Interest
Naches	Public Interest
Napeequa	Forest Inventory
North Fork Entiat	Public Interest
Rattlesnake Creek	Public Interest
Teanaway	Public Interest
Tieton	Public Interest
Waptus	Forest Inventory
Wenatchee	Nationwide Rivers Inventory
White	Nationwide Rivers Inventory

Once the list was developed, each river was evaluated to determine its eligibility. In order to be eligible a river must meet both of the following criteria:

- a. The river is free-flowing.
- b. The river or river segment possesses scenic, recreational, geological, fish, wildlife, historical, cultural or ecological values which are judged to be outstandingly remarkable.

The determination of whether a river area contains “outstandingly remarkable” values is a professional judgement. The interdisciplinary evaluation team was made up of specialists that included a Landscape Architect, Recreation Management Specialist(s), Geologist, Fisheries Biologist, Wildlife Biologist, Archaeologist, and individuals with backgrounds in ecology. The fourteen member team included representatives who were considered the most qualified river experts on each Ranger District.

ID team specialists consulted with specialists from other areas, both within the Forest Service and from various Federal, State, and private organizations, in order to develop preliminary evaluations of the “outstandingly remarkable” criteria. In addition to the ID team’s professional judgement, information and ratings from other sources were used, including the Nationwide Rivers Inventory, River Recreation in Washington: An Initial Inventory and Assessment, the Pacific Northwest Rivers Study-Washington, and other similar assessments.

During this phase of the eligibility determination, the ID team looked at both the entire river as well as individual segments, with the assumption that segments might be eligible for classification even if the entire river did not meet the free-flowing criteria.

A separate ID team conducted a suitability determination on all eligible rivers resulting from this effort. The results of the suitability determination is contained later in this Appendix.

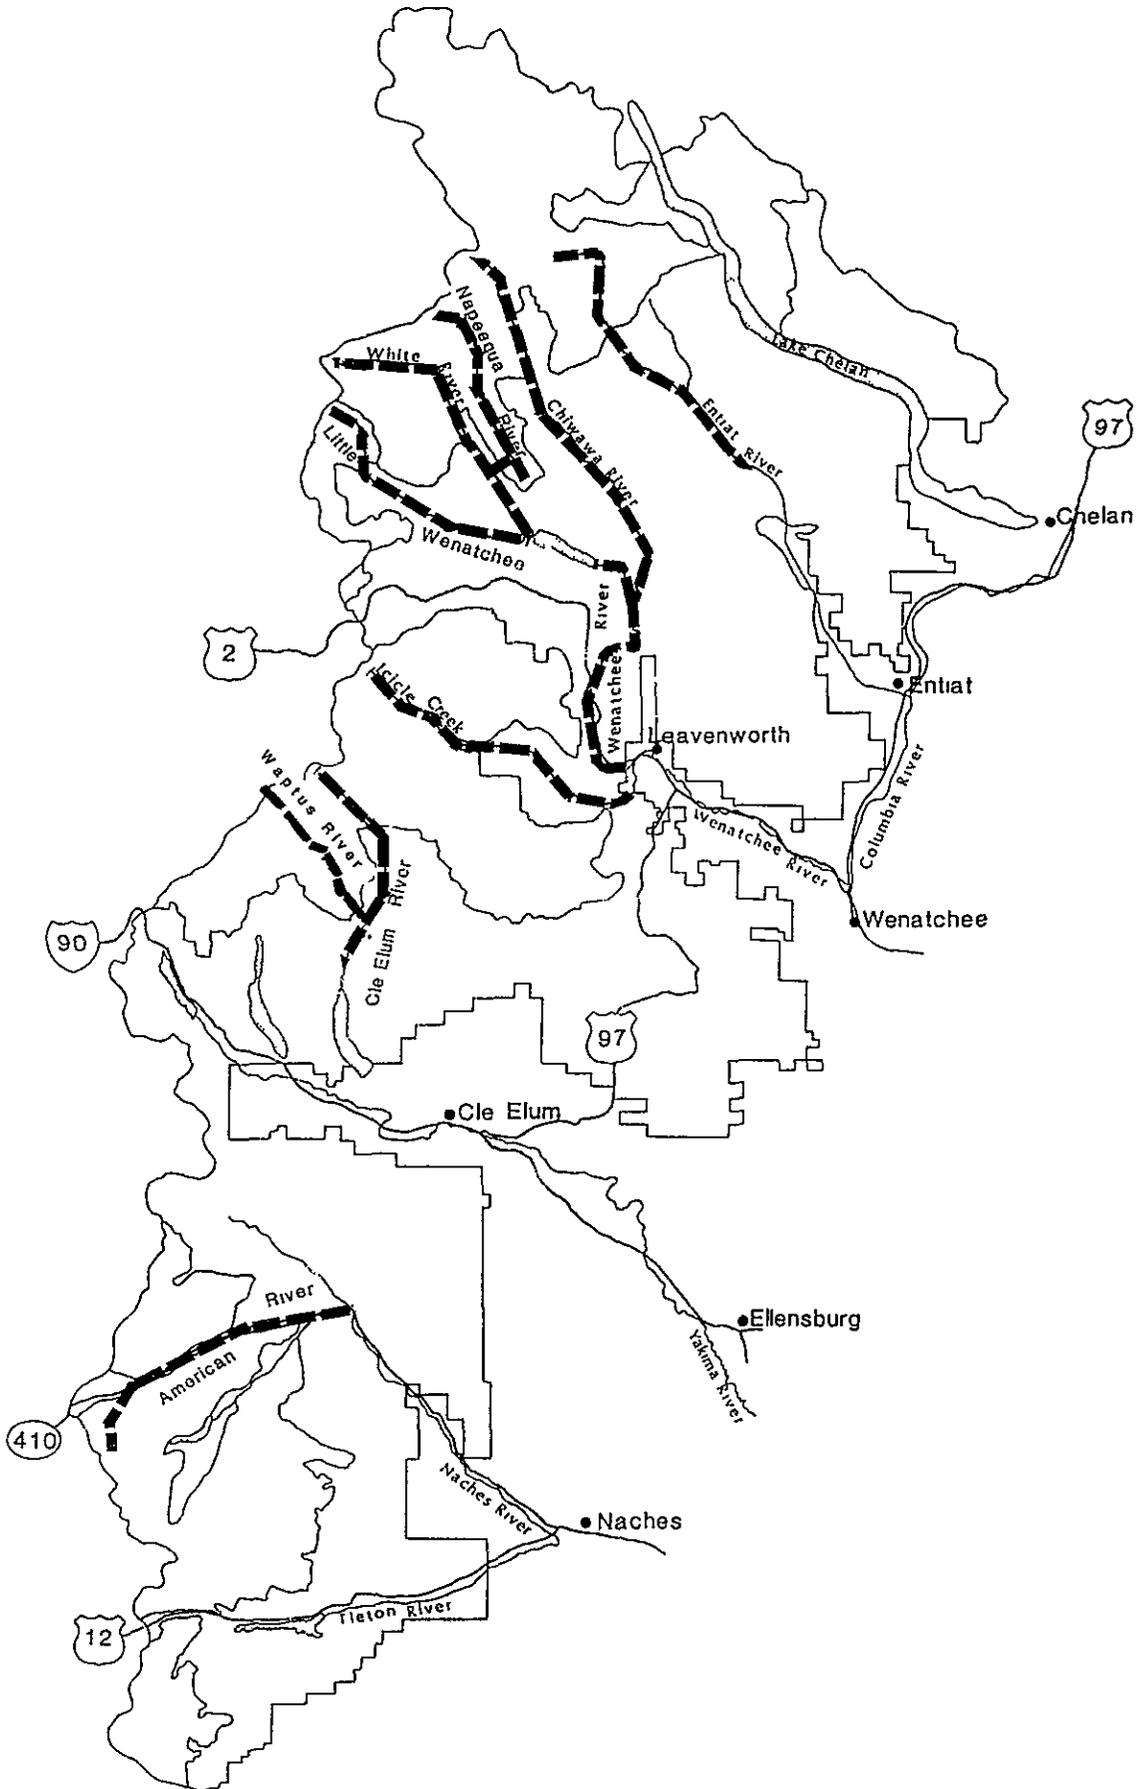

Thirteen rivers in addition to those listed above were also evaluated for potential eligibility as a result of public response to the 1988 Supplement. However, none were found to meet the eligibility criteria. The results of these findings are documented in the analysis file of the Forest Plan, and are further described in the Response to the Public Comments in Appendix K of the FEIS.

The Yakima River was not included in the eligibility determination due to the fact that National Forest lands make up less than one percent of the ownership in the drainage. However, the Yakima is listed as one of 26 rivers presently under consideration as part of the Washington State Scenic River Assessment program.

A. ELIGIBLE RIVERS

This section describes the results of the analysis of those rivers or river segments determined to be eligible for designation under the Wild and Scenic Rivers Act. The ID Team found, using the eligibility process described above, that at least segments of all of the rivers listed below are eligible for designation, and a suitability study was conducted for each. General setting, eligibility values and conclusions are discussed by Ranger District, for each river.

ELIGIBLE RIVERS UNDER THE WILD AND SCENIC RIVERS ACT

CLE ELUM RANGER DISTRICT

CLE ELUM RIVER

The Cle Elum River corridor, from the headwaters to the head of the Lake Cle Elum Reservoir, is being considered for designation as a potential Wild and Scenic River. Below this point, the river has been heavily modified by the Lake Cle Elum Dam, and as a consequence, does not meet the eligibility criteria. The total length of the portion of the corridor under study is 24.5 miles, with 45% of this being in private ownership. The upper four miles are located entirely within the Alpine Lakes Wilderness.

Within the river corridor, the approximate mileage and acreage by ownership is:

Ownership	River Miles	Corridor Acres*
Wenatchee National Forest	13.5	4,320
Private	11.0	3,520
Total	24.5	7,840

*Acres based on an estimated 1/4 mile corridor on each side of the river.

The Cle Elum River originates east of the Cascade Crest in the Alpine Lakes Wilderness. The topography varies from a broad, glaciated, U-shaped valley in the upper reaches, to a predominantly rugged, steep-walled valley midsection, to somewhat rolling, open terrain in the lower reaches. Vegetation is a mixed conifer timber type with frequent meadow openings, including some extensive wetlands. The river flows through Little Hvas, Hvas and Tucquala Lakes, three natural bodies of water within the corridor.

A significant portion of the lower Cle Elum River was heavily modified by the construction of the Lake Cle Elum Dam in 1934. Because of this, neither the impounded area nor the segment below the dam were considered eligible for designation.

A potential water deflection development is under study near the mouth of the Cooper River. The development would consist of a number of large boulders, taken from a nearby rock source, placed in chevron and linear formations within the Cooper and Cle Elum River channels. The purpose of the structures is to deflect the water away from the west bank of the Cle Elum River, in the vicinity of the Salmon La Sac Campground, where the water is badly undercutting the bank and existing facilities. The structures would be natural appearing and would neither impede the free-flowing character of the river nor alter the present channel here. There are no other potential water resource development sites nor existing impoundments along the portion of the corridor under study.

Eligibility Determination - Description and Rating of Values

Scenery The upper Cle Elum corridor is a broad, flat, glaciated valley bottom that offers expansive views of the surrounding Cascade peaks, high alpine glaciers and permanent snowfields. Ribbons of old growth, avalanche chutes, talus and bedrock outcrops mark the slopes. In the valley bottom are situated Hyas and Little Hyas Lakes, which offer a spectacular view of brilliant green marshlands contrasted with the forest green of the surrounding trees. A profusion of wildflowers fill the upland meadows along the corridor in late spring and early summer. Below the wilderness boundary, the river valley narrows. Steep, rugged rock walls enclose the river course, which plunges downward in cascades, rapids waterfalls, and occasional deep pools. In the lowest segment, the valley widens once again, offering vistas of the surrounding terrain. Huge, polished rock outcrops dot a river course that is bordered by stands of large-diameter conifers.

RANKING: Outstandingly remarkable.

Recreational The Cle Elum River corridor provides a great variety of recreation opportunities. Hiking, camping, nature study, fishing, hunting, viewing scenery, bicycling, auto touring, kayaking, summer home use and picnicking draw large numbers of people from both sides of the Cascade Mountains. There is excellent accessibility to the area, with all but the last four miles of river being within 1/4 mile of a road. The corridor also serves as a major route into the Alpine Lakes Wilderness, and intersects the Pacific Crest National Scenic Trail in the upper reaches. Hyas, Little Hyas and Tacquala Lakes provide some boating opportunities, and kayaking and white water canoeing are popular on the river. A national kayak race is held at Salmon La Sac, which attracts over 200 entrants and 1000 spectators each year.

RANKING: Outstandingly remarkable.

Geologic The river originates in seasonal snowfields near the Cascade Crest, flowing from there through glaciated valleys characterized by precipitous rock outcrops, high elevation cirques, mountain peaks, and steep, forested slopes. In the lower reaches, the river channel flows through more gently sloping, terraced glacial deposits.

RANKING: Above average.

Fish Historically, the anadromous fisheries of the Cle Elum River Valley were a major contributor to the fish runs of the Yakima and Columbia River basins. Species using the Cle Elum system were sockeye, steelhead, chinook and coho salmon. The Cle Elum Dam now blocks all passage of anadromous fish into Cle Elum Lake/Reservoir. However, a study by the Northwest Power Planning Council is underway to look at the feasibility of reintroducing anadromous salmonoids into the upper Cle Elum. Initially, sockeye salmon are the main species of study, but eventually other species may also be considered.

There is also a fair resident fishery in the Cle Elum River, including rainbow, cutthroat and Brook trout, as well as the sensitive bull trout.

RANKING: Average.

Wildlife The Cle Elum offers excellent habitat diversity. The area is used by elk, deer, black bear, cougar and bob cat. Spotted owl habitat exists within the corridor, and there is potential bald eagle, lynx and grizzly bear habitat as well. There have also been bald eagle sightings at the upper end of the Lake Cle Elum Reservoir. In addition, the steep cliffs and precipitous outcrops along the middle stretches of the river are frequented by large numbers of mountain goat.

RANKING: Above Average.

Cultural/Historical There was extensive use of the Cle Elum drainage by the Yakima Indians for fishing, hunting, camping, access to huckleberry fields and travel via Deception Pass into the Skykomish country. The area has very high cultural values today for the Yakima Indian Nation. There is also a substantial mining history connected with the corridor. Several older claims, a settlement locality, cabin sites and millsite locations exist along the valley bottom, including the Salmon La Sac Guard Station, which is on the National Register of Historic Places.

RANKING: Outstandingly remarkable.

Other Values There are a large number of ecotypes within the Cle Elum River corridor, including wetlands, avalanche chutes, riparian vegetation, cliffs, old burns and areas of mixed conifer cover. However, no sensitive plant species have been identified within the portion of the river under study.

RANKING: Above Average.

Conclusion

The Cle Elum River, above Cle Elum Lake, meets the eligibility criteria for Wild and Scenic River classification. It has "**OUTSTANDINGLY REMARKABLE**" scenic, recreational, historical and cultural values. This river should be further evaluated for its suitability as an addition to the Wild and Scenic River System.

WAPTUS RIVER

The entire Waptus River, from the headwaters to the confluence with the Cle Elum River, is being considered for designation as a potential Wild and Scenic River. The total length of the corridor is 13.0 miles, with all of the acreage being National Forest. The upper 12.0 miles are located entirely within the Alpine Lakes Wilderness.

Within the river corridor, the approximate mileage and acreage by ownership is:

Ownership	River Miles	Corridor Acres*
Wenatchee National Forest	13.0	4,160
Total	13.0	4,160

*Acres based on an estimated 1/4 mile corridor on each side of the river.

The Waptus River originates just east of the Cascade Crest in the Alpine Lakes Wilderness. Topography consists of a glaciated, U-shaped valley, interrupted by a narrow stretch of steep-walled gorge. Vegetation varies between a mixed conifer timber cover and both wet and dry meadow habitats.

The Waptus River is unmodified and free-flowing throughout its length.

Eligibility Determination - Description and Rating of Values

Scenery At its upper end, near Lake Ivanhoe, the Waptus River flows through a classic, U-shaped valley, offering a spectacular view of the pristine, timbered valley below, and of the surrounding, snow capped peaks. The river tumbles through two sizable mountain lakes and a series of falls, to its confluence with the equally scenic Cle Elum River. Old growth stands, and wet and dry meadow openings offer a diversity of vegetation for viewing, particularly the latter with their profusion of wildflowers and bog-associated plants.

RANKING: Outstandingly remarkable.

Recreational The Waptus River is tremendously popular for backcountry use by both hikers and those with stock. In fact, the Waptus River Trail #1310, an eleven mile long trunk trail that extends into the wilderness via the river corridor, is one of the most heavily used trails in the Pacific Northwest. This trail is also intersected along the way by several tributary trails as well as by the Pacific Crest Trail. Dispersed camping opportunities exist the entire length of the river.

RANKING: Above average.

Geologic The river rises in a glacially-carved, U-shaped valley. The course is typified by oxbow lakes in large, wet meadows, by sheer rock faces, and by numerous examples of glacial striations on the valley walls as well as glacial till, moraines and roches moutonnees. Near the lower reaches is a spectacular gorge, with pools and slabs characterizing the channel through there.

RANKING: Above Average.

Fish Because of the dam below Lake Cle Elum, the habitat in the lower Waptus is currently unavailable to anadromous fish. However, planted rainbow trout and the sensitive bull trout inhabit the river.

RANKING: Below Average.

Wildlife Wildlife in the Waptus corridor includes mule deer, elk, bear, coyote, cougar, spotted and barred owls, eagles, osprey, loons, many songbirds and small mammals. Excellent wildlife viewing opportunities exist in several areas along the river, including frequent mountain goat sightings on the cliffs and bluffs within the corridor.

RANKING: Average.

Cultural/Historical The Yakima Indians made use of the Waptus River corridor for backcountry hunting, plant gathering and travel. At least one prehistoric campsite has been documented within the drainage. Historic use was primarily oriented to low intensity fur trapping, represented today by the remnants of cabin sites, marten sets, and a dug-out canoe. Mining also took place within the corridor, particularly near the headwaters.

RANKING: Average.

Other Values There is a complex variety of ecotypes within the Waptus drainage. Among these are sizable old growth stands, riparian vegetation, cliffs, dry meadows, and wet lands that are characterized by a wealth of bog-associated vegetation, including the carnivorous sundew and bog orchids.

RANKING: Above Average.

Conclusion

The Waptus River meets the eligibility criteria for Wild and Scenic River classification. It has “**OUTSTANDINGLY REMARKABLE**” scenic values. This river should be further evaluated for its suitability as an addition to the Wild and Scenic River System.

ENTIAT RANGER DISTRICT

ENTIAT RIVER

The Entiat River corridor, from the headwaters to the private land boundary above Burns Creek, is being considered for designation as a potential Wild and Scenic River. Below Burns Creek, the Entiat River does not meet the eligibility criteria due to extensive straightening and channeling of the river course. The total length of the portion of the corridor under study is 31.5 miles, with all of the acreage being National Forest. The upper 12.5 miles are located entirely within the Glacier Peak Wilderness.

Within the river corridor, the approximate mileage and acreage by ownership is:

Ownership	River Miles	Corridor Acres*
Wenatchee National Forest	31.5	10,080
Total	31.5	10,080

*Acres based on an estimated 1/4 mile corridor on each side of the river.

The Entiat River originates four and one-half miles east of the Cascade Crest in the Glacier Peak Wilderness. Topography varies from a narrow, steep, glaciated valley in the upper reaches, to a somewhat broader U-shaped valley through the middle and lower stretches. Vegetation is a combination of mixed conifer timber types, with Douglas-fir, ponderosa pine and meadow openings in the lower portion. There has been some modification of the landscape adjacent to the river due to the 1970 Entiat wildfires and as a consequence of timber management activities in the area between Burns Creek and Cottonwood Campground.

There are no shoreline modifications, diversions or impoundments of the Entiat River within the potential Wild and Scenic River corridor.

Eligibility Determination - Description and Rating of Values

Scenery The scenic values of the Entiat are considered to be outstandingly remarkable. Originating in the Glacier Peak Wilderness, this steep glaciated valley is bordered by extensive snowfields and alpine glaciers, high mountain peaks, and rugged slopes with large outcrops of granite and gneiss. The river plunges in cascading rapids, riffles and falls, to a meandering course in the broader valley of the lower reaches. A mixed conifer forest, interspersed with both patches of old growth and with natural openings, contributes to the pristine setting of the river.

RANKING: Outstandingly remarkable.

Recreational Recreation use of the Entiat attracts visitors from both east and west of the Cascades. The drainage serves as an access route to the Glacier Peak Wilderness, as well as for destination camping, fishing, hunting, picnicking, water play and trail bike riding. There is occasional boating and rafting on the lower portion of the river, and in the winter months, some snowmobiling and cross-country skiing.

RANKING: Above average.

Geologic In the upper Entiat, the river plunges from its headwaters at the Entiat Glacier on Mt. Maude, in a series of glacially quarried steps and basins, to the broader floodplain of the lower reaches. Outcrops of metamorphic schist and gneiss, intrusive granodiorite and quartz diorite are blanketed through much of the corridor by glacial till and alluvium. The characteristic U-shaped valley extends through all three segments.

RANKING: Above Average.

Fish Prior to 1898, there were significant runs of chinook and coho salmon, and steelhead trout up the Entiat River. These had become nearly non-existent by the 1930's. However, rehabilitation of the runs has been ongoing for the last 25 years, and today moderate numbers of these anadromous fish run the Entiat as far as Entiat Falls.

RANKING: Average.

Wildlife Wildlife in the corridor includes a large population of mule deer, as well as black bear, coyote and spotted owl. There is wolverine habitat in the upper reaches, and bald eagle roosts near the river.

RANKING: Average.

Cultural/Historical There was modest use of the river for salmon fishing by the Entiat Indians, whose permanent villages extended as far upriver as Ardenvoir. It is also likely that hunting parties camped along the river margins, branching from here into side canyons and tributaries. Historic uses were predominantly trapping (on the upper reaches), homesteading, logging and early Forest Service administration (1920's). Some evidence of these uses are still visible today, including historic Forest Service administrative sites at Silver Falls and Cottonwood.

RANKING: Average.

Other Values There are no known sensitive plants in the portion of the drainage under study. With respect to ecotypes, the corridor is a typical upland Cascade river valley.

RANKING: Average.

Conclusion

The Entiat River meets the eligibility criteria for Wild and Scenic River classification. It has "**OUTSTANDINGLY REMARKABLE**" scenic values. This river should be further evaluated for its suitability as an addition to the Wild and Scenic River System.

LAKE WENATCHEE RANGER DISTRICT

CHIWAHA RIVER

The entire Chiwawa River, from the headwaters to the confluence with the Wenatchee River, was identified as a potential Wild and Scenic River in the Nationwide Rivers Inventory published by the National Park Service in 1982. The total length of the river is 35.0 miles. Of the total Chiwawa drainage, only 11% is in private ownership, with most of this being in the lower 3 1/2 miles of the river. The upper five miles are located entirely within the Glacier Peak Wilderness.

Within the river corridor, the approximate mileage and acreage by ownership is:

Ownership	River Miles	Corridor Acres*
Wenatchee National Forest	30.5	10,240
Private	4.5	1,280
Total	35.0	11,520

*Acres based on an estimated 1/4 mile corridor on each side of the river.

The Chiwawa River originates east of the Cascade Crest in the Glacier Peak Wilderness. Topography consists of a narrow, steep, glaciated valley in the upper reaches, a broader U-shaped corridor through the middle stretch, and rolling to somewhat flat terrain near the mouth. Vegetation is a combination of mixed conifer timber types, with Douglas-fir, ponderosa pine and meadow openings in the lower portion.

Some riprap and a diversion exist along the middle and lower reaches of the river. Approximately 150 to 200 feet of log and rock cribbing has been installed along the bank at Atkinson Flat Campground, in the NW 1/4 of Section 23, T.29N., R.16E. The six foot wide Wenatchee-Chiwawa Irrigation Canal takes off from an intake box on the south side of the Chiwawa in the NW 1/4 of Section 30, T.27N., R.18E., and parallels the west edge of the river corridor for approximately four miles, before diverging to the Wenatchee. Other small irrigation diversions exist along the lower three miles of the river, but none impede the free-flowing character of the Chiwawa.

One other development soon to be constructed by the Chelan County P.U.D. in the NE 1/4 of Section 1, T.26N., R.17E., and the SE 1/4 of Section 36, T.27N., R.17E. is a fish rearing station. The facility will consist of a large slotted concrete intake "box" along the north riverbank, a small stretch of riprap, an outflow pipe, and 200 feet upland of the river, fenced rearing ponds and support facilities. The intake will divert approximately 21 cfs from the Chiwawa to the rearing station. Associated with this will also be a small intake structure and outfall pipe on the Wenatchee River, approximately 1600 feet northwest of the rearing ponds. The development plans for the entire project have been reviewed by the National Park Service, and were determined to be consistent with the criteria established for the Recreational classification of this segment of the Chiwawa.

Eligibility Determination - Description and Rating of Values

Scenery The Chiwawa drainage is typified at its upper end by towering mountain peaks, extensive snowfields and imposing valley walls with numerous rocky areas. The river channel here is narrow and plunges downstream in frequent cascades and small falls, which gradually lessen in intensity as the river enters the broader, U-shaped valley of the mid- and lower segments.

RANKING: Outstandingly remarkable.

Recreational A naturally scenic environment, reasonable access, rustic campground developments, and good fishing, hunting, hiking and white water rafting opportunities attract large numbers of users to the Chiwawa every year. The middle stretches of the river provide one of the most popular recreation destinations in the Lake Wenatchee area. In the winter months, snowmobiling is a frequent activity, with the Trinity townsite serving as a destination location. The Chiwawa is also the most heavily used access route into the Glacier Peak Wilderness east of the Cascades.

RANKING: Outstandingly remarkable.

Geologic The geology of the Chiwawa is typical of the other river systems that are tributary to the upper Wenatchee drainage. The river rises in glaciers, seasonal snowfields, and meadows near the Cascade Crest, plunging from there through a steep-walled glaciated valley. Outcrops of Jurassic gneiss at the upper end are replaced by a mantle of alpine glacial outwash from a point just above Rock Creek down to the confluence of the Chiwawa with the Wenatchee River, where the topography is characteristically more open and rolling.

RANKING: Above Average.

Fish The Chiwawa is fairly unique in the upper Columbia River system because of the high number of wild, unsupplemented runs of spring chinook and steelhead. There is also an excellent resident fishery, and the bull trout, a sensitive species, inhabits the river.

RANKING: Outstandingly remarkable.

Wildlife Common animal life in the Chiwawa include mule deer, black bear, mountain goat, spotted, barred and great horned owl, pine marten, beaver and otter. In the lower Chiwawa are osprey, bald eagle and elk. Grizzly bear habitat has been identified in the drainage as well.

RANKING: Average.

Cultural/Historical There was substantial use of the Chiwawa by Wenatchi Indians for fishing, hunting and access to berry fields. A summer village was reportedly located near Rock Creek, and the Wenatchi people have retained a strong cultural association with the Chiwawa. Historic use of the drainage was directed primarily to mining and trapping. Numerous examples of cabin sites, mining features and a historic townsite remain.

RANKING: Above Average.

Other Values There is a good variety of ecotypes within the Chiwawa River corridor, including wetlands, cottonwood groves, wet site, old growth western red cedar and old growth, mixed conifer forest. No sensitive plant species have been identified within the portion of the river under study.

RANKING: Above Average.

Conclusion

The Chiwawa River meets the eligibility criteria for Wild and Scenic River classification. It has "**OUTSTANDINGLY REMARKABLE**" scenic, recreational and fishery values. This river should be further evaluated for its suitability as an addition to the Wild and Scenic River System.

LITTLE WENATCHEE RIVER

The Little Wenatchee River, from the headwaters to the outlet at Lake Wenatchee, is being considered for designation as a potential Wild and Scenic River. The total length of the river is 27.5 miles. Of the acreage in the corridor, 9% is in private ownership, this being concentrated along the lower reaches of the river. The upper six miles are located entirely within the Henry M. Jackson Wilderness.

Within the river corridor, the approximate mileage and acreage by ownership is:

Ownership	River Miles	Corridor Acres*
Wenatchee National Forest	25 0	8,000
Private	2 5	800
Total	27.5	8,800

*Acres based on an estimated 1/4 mile corridor on each side of the river.

The Little Wenatchee River originates east of the Cascade Crest in the Henry M. Jackson Wilderness. Topography ranges from a broad, hanging valley at the far, upper end, to sections of steep-sided gorges in the upper and middle reaches, to a wide, meandering river channel along the lower eight miles. Vegetative cover also varies from open meadows to a mixed conifer timber cover.

The Little Wenatchee River is free-flowing throughout its length.

Eligibility Determination - Description and Rating of Values

Scenery At its upper end, the Little Wenatchee River meanders across a broad, meadow-filled, hanging valley ringed by sharply incised, snow-capped peaks. The river plunges from this valley in a spectacular falls, tumbling through a series of gorges, to a more sinuous course in the wider valley of the lower reaches.

RANKING: Above average.

Recreational Recreation use along the river is primarily directed to camping, fishing, hiking and hunting. The drainage serves as a popular access route to the Henry M. Jackson and Glacier Peak Wildernesses.

RANKING: Average.

Geologic The river rises in a glacially-carved, hanging valley near the Cascade Crest, tumbling from there through a series of steep-walled gorges characterized by numerous, metamorphic outcrops. In the lower reaches, the river channel is one of slower meanders due to the open, more gently rolling topography near Lake Wenatchee.

RANKING: Above Average.

Fish The Lake Wenatchee system, of which the Little Wenatchee River is a tributary, is one of only two remaining lake/river systems in the Columbia River drainage that still supports a natural run of sockeye salmon. The lower eight miles of the Little Wenatchee provides important spawning habitat for approximately 25% of this run. In addition, there are spring chinook salmon as well as steelhead in this lower eight mile stretch.

RANKING: Outstandingly Remarkable (in the lower, eight mile stretch).

Wildlife The mix of riparian vegetation, cliffs, slide areas, and variety of tree species provide habitat for the black bear, mule deer, spotted owl, osprey, great blue heron, bald eagle and peregrine falcon.

RANKING: Above Average.

Cultural/Historical The Wenatchi Indians made use of the Little Wenatchee drainage for access to the backcountry and as a travelway through the Cascades to what is now western Washington. It is likely that small fishing camps were also established along the lower stretches. Historic use was directed primarily to fur trapping and travel by early exploring expeditions.

RANKING: Average.

Ecological There is a high variety of ecotypes within the Little Wenatchee drainage, including alpine meadows, wetlands, riparian vegetation, cliffs, avalanche chutes, and old growth conifers. However, no sensitive plant species have been identified within the corridor.

RANKING: Above Average.

Conclusion

The lower eight mile segment of the Little Wenatchee River meets the eligibility criteria for Wild and Scenic River classification. It has "**OUTSTANDINGLY REMARKABLE**" fish values. This segment should be further evaluated for its suitability as an addition to the Wild and Scenic River System. Although the remainder of the river has above average values, none are "outstandingly remarkable." Classification of those river segments and determination of suitability is not recommended.

NAPEEQUA RIVER

The entire Napeequa River corridor, from the headwaters to the confluence with the White River, is being considered for designation as a potential Wild and Scenic River. The total length of river is 16.0 miles. Of the total acreage in the corridor, 6% is in private ownership, all of this being in the lowest mile of the river. The upper 15 miles are located within the Glacier Peak Wilderness, and include the main-stem of the Napeequa as well as the Twin Lakes Creek tributary.

Within the river corridor, the approximate mileage and acreage by ownership is:

Ownership	River Miles	Corridor Acres*
Wenatchee National Forest	15.0	4,806
Private	1.0	314
Total	16.0	5,120

*Acres based on an estimated 1/4 mile corridor on each side of the river.

(The confluence of the Napeequa with the White River overlaps with acreage that is also part of the proposed Scenic River corridor of the White.)

The Napeequa River originates east of the Cascade Crest in the Glacier Peak Wilderness. The topography is dominated by a narrow, steep, talus-walled valley. Vegetation is a mixed conifer timber type with frequent natural openings.

There are no impoundments or diversions of the river, but riprap has been installed near the confluence of the Napeequa with the White River, as well as in the vicinity of the Tall Timbers Homeowners Association subdivision. These minor shoreline modifications do not impede the free-flowing characteristics of the river, however.

Eligibility Determination - Description and Rating of Values

Scenery The Napeequa River is noted for its outstanding scenery. The river flows through a high elevation glacial trough that eventually narrows to a steep, talus-walled valley. Towering mountain peaks, impressive alpine glaciers, extensive snowfields, rugged granitic outcrops, and a vegetative cover marked by scattered old growth, hardwoods, and interspersed meadow openings, characterize the corridor. The watercourse tumbles through this valley in a series of waterfalls, cascades and slow meanders.

RANKING: Outstandingly remarkable.

Recreational Most of the recreation use on the Napeequa is in connection with the developments on private land in the lowest stretches. Above this point, recreation use is light, being directed primarily to hiking, dispersed camping, hunting and fishing. The drainage also serves as a minor access route into the Glacier Peak Wilderness. Because of the low density of use, the Napeequa provides a good opportunity for solitude.

RANKING: Below Average.

Geologic The Napeequa River rises in glaciers, snowfields and meadows in the Cascade peaks, flowing through a pronounced, high elevation glacial trough that dramatically changes at midsection to a narrow, talus-walled, U-shaped valley.

RANKING: Outstandingly remarkable.

Fish The Napeequa is one of four rivers in Eastern Washington where a natural sockeye run still exists. However, because of a waterfall, the run is limited to the first few miles only. The bull trout, a sensitive species, also inhabits the river.

RANKING: Above Average.

Wildlife The Napeequa provides summer range for deer, and habitat for black bear, beaver, otter, spotted owl (in the lower reaches) and golden eagle. There is good mountain goat habitat the entire length, and at least one grizzly bear sighting has been reported in the drainage.

RANKING: Average.

Cultural/Historical Prehistoric use of the river is unknown. A Wenatchi Indian fishing camp was reportedly once situated on the White River, near the mouth of the Napeequa. However, no cultural resource survey work has been conducted along this drainage, and there are presently no sites identified. Historic uses are likewise unknown.

RANKING: Below Average.

Other Values There is a complex variety of ecotypes in this drainage, associated with the geologic formation and glacial history of the valley.

RANKING: Average.

Conclusion

The Napeequa River meets the eligibility criteria for Wild and Scenic River classification. It has "**OUTSTANDINGLY REMARKABLE**" scenic and geologic values. This river should be further evaluated for its suitability as an addition to the Wild and Scenic River System.

WENATCHEE RIVER

The Wenatchee River, from the outlet of Lake Wenatchee to the confluence with Icicle Creek, was identified as a potential Wild and Scenic River in the Nationwide Rivers Inventory published by the National Park Service in 1982. This portion of the river is approximately 30.0 miles in length. Twenty-eight of these miles are within the boundary of the Wenatchee National Forest, and include a mix of National Forest, Washington State and private ownership. The remaining 2.0 miles outside the Forest boundary are entirely private.

Within the river corridor, the approximate mileage and acreage by ownership is:

Ownership	River Miles	Corridor Acres*
Wenatchee National Forest	12.25 miles	3920 acres
Wenatchee NF/Private Mix ^{1/}	5.00 miles	1600 acres
State of Washington	.5 miles	160 acres
State of WA/Private Mix ^{2/}	1.5 miles	480 acres
Private	10.75 miles	3440 acres
Total	30.0 miles	9600 acres

*Acres based on an estimated 1/4 mile corridor on each side of the river.

^{1/} National Forest on one side of the river through this portion of the corridor, private on the other.

^{2/} State of Washington on one side of the river through this portion of the corridor, private on the other.

The Wenatchee River originates at the outlet of Lake Wenatchee. Topography is flat or gently rolling from the Lake to the upper end of Tumwater Canyon. The canyon is well known for its spectacular cliffs, rugged outcrops, steep slopes and plunging river course. Vegetation consists of mixed conifer timber types, Douglas-fir and ponderosa pine, with meadows in the upper portion.

One impoundment and a diversion exist within the Tumwater Canyon portion of the river. The Tumwater Dam, a sixteen foot high concrete structure in the SE 1/4 of Section 33, T.25N., R.17E., was constructed in 1909 by Great Northern Railroad to divert water for power generation in the electrification of their railroad line. The dam resulted in the formation of Lake Jolanda, a pristine, three-quarter mile long reservoir located on private land behind the dam. With the exception of the dam itself, there are no longer any water diversion facilities at the site. The river is essentially unimpeded today (it spills freely over the dam), a fish ladder was recently reconstructed to allow more efficient passage of salmon and steelhead, and the shoreline and lakeshore remain natural and riverine in appearance. Because of its historic associations with Great Northern, whose line once traversed Tumwater Canyon, the dam and former powerhouse site provide an excellent opportunity for interpretation.

About one half mile above the mouth of Tumwater Canyon, on the south side of the river, is an old concrete diversion box and remnants of a canal. These facilities were built by the Leavenworth Fish Hatchery, but are no longer in use.

Near the mouth of the Chiwawa River, planning is under way for the construction of a water intake structure and outflow pipe along the river bank as part of a fish rearing station that is to be built on the Chiwawa. The intake will divert approximately 12 cfs from the Wenatchee River, to be used as warming water to supplement that being taken from the Chiwawa.

Eligibility Determination - Description and Rating of Values

Scenery The Wenatchee drainage ranges from gently rolling, forested terrain interspersed with open meadows in the vicinity of Lake Wenatchee, to spectacular cliffs, enormous boulders, craggy outcrops and cascading rapids through Tumwater Canyon. The canyon is particularly noted for its outstanding scenery viewing.

RANKING: Outstandingly remarkable.

Recreational The Wenatchee River experiences heavy recreation use due to the diverse, all season opportunities available. Camping, picnicking, hiking, driving for pleasure, viewing scenery, rock climbing, fishing, water play, cross country skiing, snowmobiling, horseback riding and photography draw people in steady numbers from both sides of the mountains to the corridor. The entire length of the river is accessible by road, it provides a strong attraction to those who enjoy white water rafting and boating, and the Tumwater Canyon stretch is perhaps one of the most scenic river segments in the State.

RANKING: Outstandingly remarkable.

Geologic The river originates at the outlet of Lake Wenatchee, meandering from there through flat to gently rolling terrain for two-thirds of its length above Tumwater Canyon. The lower third of the potentially eligible portion of the river is dominated by the rugged Tumwater Canyon, with its steep, nearly vertical walls, immense boulders, and plunging rapids.

RANKING: Above Average.

Fish The river is noted for its excellent fishing with high success ratios. There are resident planted fish as well as large runs of steelhead, sockeye salmon, and spring and summer/fall chinook salmon, which spawn or travel through the river. The Wenatchee River system is one of only two remaining river/lake systems in the Columbia River drainage that supports a natural, self-sustaining sockeye run. A sensitive species (bull trout) also inhabits this river.

RANKING: Outstandingly remarkable.

Wildlife There is good diversity in the wildlife habitat available, including an extensive riparian zone, many cliffs and rock outcrops, slide areas, and the variety of ecotypes associated with these. Among the more notable wildlife using the corridor are black bears, mule deer, spotted owls, osprey, great blue herons, bald eagles and peregrin falcons.

RANKING: Above Average.

Cultural/Historical The Wenatchee River corridor falls within the traditional fishing territory of the Wenatchi Indians. There was intensive use of the drainage prehistorically and in early historic times by these people for winter and summer settlements, fishing and as a major travelway to western Washington. This portion of the river drainage contains numerous identified archaeological sites, including the only known petroglyph site on the Wenatchee National Forest. There was early historic settlement of the drainage (beginning in the 1870's below Leavenworth and 1880's above), transportation use (Great Northern Railroad and turn-of-the-century highway development), hydroelectric development (in Tumwater Canyon) and placer mining.

RANKING: Outstandingly Remarkable.

Other Values The Tumwater Canyon portion of the Wenatchee River is exceptional ecologically because of the high variety of ecotypes present: the steep side slopes, rugged cliffs, and unusual soils. This is one of only two locations known where a small population of Hackelia venusta occurs. (This plant is being proposed for listing as an endangered species.) A Special Botanical Area has also been created within the canyon in recognition of the Lewisia tweedyi species that grows here.

RANKING: Outstandingly Remarkable.

Conclusion

The Wenatchee River meets the eligibility criteria for Wild and Scenic River classification. It has "**OUTSTANDINGLY REMARKABLE**" scenic, recreational, fishery, historical, cultural, and ecological values. This river should be further evaluated for its suitability as an addition to the Wild and Scenic River System.

WHITE RIVER

The entire White River corridor, from the headwaters to Lake Wenatchee, was identified as a potential Wild and Scenic River in the Nationwide Rivers Inventory published by the National Park Service in 1982. The total length of river is 34.0 miles. Of the total acreage in the corridor, 22% is in private ownership, all of this being in the lower third of the river. The upper 15 miles are located entirely within the Glacier Peak Wilderness.

Within the river corridor, the approximate mileage and acreage by ownership is:

Ownership	River Miles	Corridor Acres*
Wenatchee National Forest	26.5	8,440
Private	7.5	2,440
Total	34.0	10,880

*Acres based on an estimated 1/4 mile corridor on each side of the river.

The White River originates east of the Cascade Crest in the Glacier Peak Wilderness. Topography varies from a narrow, steep, glaciated valley at the upper end, to somewhat rolling terrain near Lake Wenatchee. Vegetation is a mixed conifer timber type, with extensive meadowlands in the lower portion.

A limited amount of riprap has been installed along the river bank five miles upstream of Lake Wenatchee and at the approaches to the Sears Creek bridge. As mentioned in the Napeequa analysis, there is also riprap along the Napeequa near its confluence with the White River. These are small, unobtrusive alterations, however, and there are no diversions or impoundments to impede the free-flowing character of the river.

Eligibility Determination - Description and Rating of Values

Scenery The White River is noted for its varied and outstanding scenery. Originating high in the Glacier Peak Wilderness, the river takes its name from the glacial silt that gives it a distinct milky appearance. At its upper end, the river plunges through a steep-walled glaciated valley that is bordered by stark mountain peaks, impressive alpine glaciers, precipitous cliffs, and numerous bare rock slopes, into the broader, more gently rolling terrain near Lake Wenatchee. The river corridor is one of cascading riffles and white water rapids, meanders, oxbows and wetlands. Patches of old growth interspersed with lush, green meadows add to the pristine ambience of the corridor.

RANKING: Outstandingly remarkable.

Recreational The White River has high recreation use. Stands of unusually large cottonwood and old growth conifers, quiet, riverside meadows, and a river course that ranges from thundering falls to pastoral meanders, plus opportunities for hiking, picnicking, camping, fishing, hunting, and rafting offer an irresistible attraction to visitors from both east and west of the Cascades. In addition, the drainage serves as an entry point to the Glacier Peak Wilderness. During the winter months, there are good cross-country skiing opportunities, particularly along the established road system.

RANKING: Above Average.

Geologic The river originates in high alpine glaciers and seasonal snowfields near the crest of the Cascade Mountains, tumbling from there through a steep-walled valley that is characterized by numerous metamorphic outcrops. The course is marked at the upper and mid-reaches by vigorous rapids, riffles and falls. The lower stretches, however, are distinctive for their sinuous meanders and oxbows, as the river enters the flatter terrain near Lake Wenatchee.

RANKING: Above Average.

Fish The Lake Wenatchee system, of which the White River is a tributary, is one of only two remaining lake/river systems in the Columbia River drainage that still support a natural run of sockeye salmon. Within the Lake Wenatchee system, the majority of these sockeye spawn in the White River. In addition, there are spring chinook, as well as steelhead runs up the White. The sensitive bull trout also inhabits the river.

RANKING: Outstandingly remarkable.

Wildlife The White River offers a great variety of wildlife habitat. In the lower stretches are such riverine species as osprey, great blue heron, beaver and otter. The area is also an important bald eagle wintering grounds and is currently being used as a bald eagle nesting site. The middle reaches are highly productive black bear habitat, and there has been at least one sighting of moose here. In the upper segment are spotted owl, grizzly bear and wolverine habitat. Mountain goats use the cliffs along the north side of the corridor, and mule deer, elk, cougar and marten can be found throughout the drainage. The White River also has the highest density of pileated woodpeckers on the Lake Wenatchee Ranger District.

RANKING: Above Average.

Cultural/Historical The White River drainage received substantial use by the Wenatchi Indians for fishing, cedar bark collection and access to backcountry berry fields and hunting localities. The drainage also provided a travelway to western Washington, with a connecting route into the Chiwawa drainage as well. There was early homesteading along the lower reaches, and historic fur trapping and sheep grazing use in the upper segment.

RANKING: Above Average.

Other Values The broad valley bottom, mix of vegetation, and presence of cliffs contributes to an above average variety in ecotypes within the river corridor.

RANKING: Above Average.

Conclusion

The White River meets the eligibility criteria for Wild and Scenic River classification. It has "**OUTSTANDINGLY REMARKABLE**" scenic and fishery values. This river should be further evaluated for its suitability as an addition to the Wild and Scenic River System.

LEAVENWORTH RANGER DISTRICT

ICICLE CREEK

Icicle Creek was identified as a potential Wild and Scenic River in Phase I of the Nationwide Rivers Inventory published by the National Park Service. The corridor, from the headwaters to the Forest boundary, is currently being considered for designation as part of the National System. Below the Forest boundary, the Icicle does not meet the eligibility criteria due to impediments to the free-flowing character of the river. The total length of the creek above the Forest boundary is 28.5 miles. Of the acreage in the corridor, 30% is in private ownership. The upper 12 miles are located entirely within the Alpine Lakes Wilderness.

Within the river corridor, the approximate mileage and acreage by ownership is:

Ownership	River Miles	Corridor Acres*
Wenatchee National Forest	20.0	6,400
Private	8.5	2,720
Total	28.5	9,120

*Acres based on an estimated 1/4 mile corridor on each side of the river.

Icicle Creek originates east of the Cascade Crest in the Alpine Lakes Wilderness. Topography consists of a predominantly narrow, steep, glaciated valley, with sections of broader floodplain and more rounded hills. Vegetation varies from a mixed conifer timber type with frequent natural openings, to Douglas-fir and ponderosa pine in the lower elevations.

In midsection, 500 feet of riprap has been installed to protect the river bank and improvements here. The lower stretches have been affected to some degree by three water developments: the Leavenworth National Fish Hatchery diversion, which is located outside the Forest boundary; the Icicle Irrigation District dam and canal in the SE 1/4 of Section 28, T.24N., R.17E.; and the City of Leavenworth water intake, in the same general location.

Although the Fish Hatchery dam is downstream of the eligible segments of the river, it does have some effect on the quality of the upper river corridor in that the dam blocks all upstream fish passage. In addition, both the Fish Hatchery and the Irrigation District have facilities on some of the high mountain lakes that drain into the Icicle near the lower end of the corridor. These facilities allow the storage and release of additional water into the river on an "as needed" basis.

The Icicle Irrigation District dam is a small, spillway type of structure that serves to divert water into a nearby canal. There is no impoundment of the water behind it. The City of Leavenworth water intake, a block-like cement structure set into the river bank, also has no effect on the free-flowing character of the Icicle.

Eligibility Determination - Description and Rating of Values

Scenery The Icicle is a narrow, steep, glaciated valley characterized by a cascading water course that plunges downstream in a series of cataracts, riffles and rapids. Views from the river are of high, open ridges, extensive snowfields, majestic peaks, and rugged slopes with many granite cliffs and outcrops. The mixed conifer cover is interspersed with frequent natural openings.

RANKING: Outstandingly remarkable.

Recreational The Icicle drainage is exceptionally popular because of its easy accessibility to visitors from both the Puget Sound area to the west, and north central Washington and the Columbia Basin to the east. In addition, its proximity to the well known tourist village of Leavenworth substantially contributes to the public use along the corridor. The lower 16 1/2 miles are completely reachable by road, the upper twelve by trail. The valley is noted for several granite outcroppings of special appeal to rock climbers, and the upper drainage serves as an important entry point to the Alpine Lakes Wilderness.

RANKING: Outstandingly remarkable.

Geologic The river originates at Lake Josephine and in seasonal snowfields and meadows near the Cascade Crest, plunging from there through a U-shaped glaciated valley characterized by precipitous granite cliffs and outcrops, and rugged, forested slopes.

RANKING: Average.

Fish Because of the diversion dams on the lower reaches of the creek, the habitat above these is unavailable to anadromous fish. However, there is a fair resident fishery above these facilities.

RANKING: Average.

Wildlife A diversity of ecotypes offers habitat to both the spotted and barred owl, as well as to mule deer, elk and mountain goat.

RANKING: Average.

Cultural/Historical A prehistoric salmon fishery was once situated at the mouth of the Icicle, and the Wenatchi Indians used the upper corridor for the collection of plant materials, for travel into the backcountry and for overland access into the Cle Elum drainage. The corridor also served as a travelway in historic times for miners with claims in the upper Jack Creek and French Creek drainages. And finally, the Chatter Creek Guard Station near the confluence of Chatter Creek with the Icicle, is listed on the National Register of Historic Places.

RANKING: Average.

Other Values There are no known sensitive plants in the Icicle drainage. With respect to ecotypes, the corridor is a typical upland Cascade river valley.

RANKING: Average.

Conclusion

The Icicle Creek meets the eligibility criteria for Wild and Scenic Rivers classification. It has "**OUTSTANDINGLY REMARKABLE**" scenic and recreational values. This river should be further evaluated for its suitability as an addition to the Wild and Scenic River System.

NACHES RANGER DISTRICT

AMERICAN RIVER

The American River corridor, from the headwaters to the confluence with the Bumping River, is being considered for designation as a potential Wild and Scenic River. The total length of river is 22.0 miles, with all of the corridor being National Forest. The upper six miles of the river are located entirely within the William O. Douglas Wilderness.

Within the river corridor, the approximate mileage and acreage by ownership is:

Ownership	River Miles	Corridor Acres*
Wenatchee National Forest	22.0	7,040
Total	22.0	7,040

*Acres based on an estimated 1/4 mile corridor on each side of the river.

The American River originates east of the Cascade Crest at American Lake, in the William O. Douglas Wilderness. This is the only eligible river system on the Wenatchee National Forest occurring within the Recent High Cascades Landscape Type. Topography ranges from a broad, U-shaped, glaciated valley near the headwaters of the river, to a narrow, steep-walled rocky canyon in the lower reaches. Vegetation types likewise vary from mixed conifer forest in the upper end to Douglas-fir and ponderosa pine in the lower stretches.

The river is an important source for downstream irrigation, but there are no known water resource developments or modifications. The American River is free-flowing its entire length.

Eligibility Determination - Description and Rating of Values

Scenery The American River drainage is noted for its varied, outstanding scenery. Originating high in the William O. Douglas Wilderness, the upper course tumbles eastward through a broad, glaciated valley characterized, near the Cascade Crest, by immense, back-to-back cirque basins. At its lower end, the river corridor changes dramatically, as it plunges through a narrow, winding canyon accentuated by precipitous andesite cliffs. The river course is one of cascading rapids, riffles and white water areas throughout the segments under study. Lands adjacent to Highway 410, along the north side of the river, have been designated by the Secretary of Agriculture as the Mather Memorial Parkway "for the use and the enjoyment of the general public for scenic and recreation purposes..."

RANKING: Outstandingly remarkable.

Recreational The American River corridor serves as an access route to Mt. Rainier National Park, attracting both transitory and destination-oriented use. Visitors from the Yakima and Tri-Cities area to the east, and Puget Sound to the west, camp, fish, hunt, picnic, hike and view scenery along the the river. White water kayaking attracts the more adventuresome, and there is some cross-country skiing in the winter months. Trailheads along the river provide entry points into both the Norse Peak and William O. Douglas Wilderness.

RANKING: Above average.

Geologic Glaciation has left a distinctive pattern, at the upper end of the American River, of huge, back-to-back cirques and broad valley bottoms through which the river tumbles. Below Hell's Crossing, the corridor narrows to a winding canyon with steep andesite cliffs.

RANKING: Above Average.

Fish Although the spring chinook and steelhead runs are low at present, the American River has the highest quality fishery in the Naches River system in terms of probable genetic integrity of the species, and quality of the spawning habitat. The potential for enhancement of these species is high. There is also a good resident fishery, and a sensitive species, the bull trout, inhabits the river.

RANKING: Above Average.

Wildlife High quality old growth forest and high elevation wetlands, bogs and meadows in the drainage support a variety of wildlife species. The bald eagle, a threatened species, and the endangered peregrine falcon, both use the American River as a feeding source. The river corridor is also used by the Northern Spotted Owl, Rocky Mountain elk, mule deer and a number of small mammals.

RANKING: Above Average.

Cultural/Historical The American River was formerly within the territory of the Yakima Indians, and was used throughout the spring, summer and fall for hunting, fishing and travel. Archaeological evidence of this use has been identified throughout much of the corridor. Historic mining, livestock grazing and fur trapping occurred in the upper reaches, with occasional remnants still visible in the river corridor.

RANKING: Above Average.

Other Values The American River provides a good variety of ecotypes, including old growth forest, high elevation wetlands, bogs, meadows, riparian vegetation, talus slopes, cliffs and other rock forms. There are no known sensitive plants within the corridor.

RANKING: Above Average.

Conclusion

The American River meets the eligibility criteria for Wild and Scenic River classification. It has "**OUTSTANDINGLY REMARKABLE**" scenic values. This river should be further evaluated for its suitability as an addition to the Wild and Scenic River System.

B. INELIGIBLE RIVERS

This section describes the information and results of the eligibility analysis for the rivers determined to be ineligible for classification under the Wild and Scenic Rivers Act.

Using the eligibility process described earlier, ten of the twenty rivers considered in the Supplement were determined to be ineligible for designation because they did not meet the free-flowing criteria and/or, in the professional judgement of the ID team, they did not appear to have an outstandingly remarkable value. These rivers, and the rationale for their ineligibility, are summarized in Table E-2.

TABLE E-2
RIVERS FOUND INELIGIBLE

RIVER	WHY INELIGIBLE
Bumping	One segment not free-flowing, other segments without one outstandingly remarkable value.
Cooper	No outstandingly remarkable values.
Kachess	Large segment not free-flowing, other segments without one outstandingly remarkable value.
Little Naches	River channel modified for significant part of length.
Mad	No outstandingly remarkable values.
Naches	No outstandingly remarkable values
North Fork Entiat	No outstandingly remarkable values.
Rattlesnake Creek	No outstandingly remarkable values.
Teanaway	Segments not free-flowing; other segments without one outstandingly remarkable value.
Tieton	One segment not free-flowing; other segments without one outstandingly remarkable value.

A more detailed description of the ineligible rivers and their ratings are included below.

In the original Appendix E, distributed with the Wenatchee National Forest DEIS, the North Fork Entiat and the Mad Rivers were identified in an alternative proposed by a coalition of environmental groups, as eligible and recommended for further study. The eligibility of the rivers was based on the fact that they are free-flowing. However, a thorough assessment of their eligibility with respect to "outstandingly remarkable" values was not made. The Supplement completed this eligibility determination, and recommended no further study of the North Fork Entiat and Mad Rivers.

The following is a discussion of the general setting, eligibility values and conclusions for each of the ineligible rivers. With the exception of the reassessment of the Waptus River, and a rearrangement of the sequence in which the rivers are presented, these descriptions are presently unchanged from the 1988 Supplement.

CLE ELUM RANGER DISTRICT

COOPER RIVER

Total miles of river to the confluence with the Cle Elum River is 10.5 miles. All of the 10.5 miles are within the Wenatchee National Forest boundary and 3.0 miles are within the Alpine Lakes Wilderness. Approximately 2.0 miles are on private land.

Within the river corridor, the approximate mileage and acreage by ownership is:

Ownership	River Miles	Corridor Acres*
Wenatchee National Forest	8.5	2,720
Private	2.0	640
Total	10.5	3,360

*Acres based on an estimated 1/4 mile corridor on each side of the river.

The Cooper River originates east of the Cascade Crest within the Alpine Lakes Wilderness, and is free-flowing for most of its length. There is one lake within the mid-portion of the drainage. Topography ranges from a glaciated valley to a somewhat narrow valley at the lower end. Vegetation type is primarily mixed conifer.

The river is paralleled by Forest road #4600 for approximately eighty percent of its length outside of the Wilderness. Some vegetation adjacent to the river is modified through timber harvest and roading. Access to the river is provided by Forest roads and trails.

Recreation is primarily hiking, camping, fishing and hunting. There are two Forest Service developed campgrounds and some undeveloped sites used for camping. There is no known use of the river by boaters. A water falls between Cooper Lake and the Cle Elum River inhibits use by floaters.

Eligibility Determination - Description and Rating of Values

Scenery The landform is dissected by ridges and moderately steep slopes. The river and streams have rapids and cascades with meandering segments. Heavy timber stands occur with frequent natural openings and rock outcrops.

RANKING: Above average.

Recreational Use along the river is primarily camping, fishing, and hunting. Serves as access to the Alpine Lakes Wilderness.

RANKING: Above Average.

Geologic The river rises in seasonal snowfields with mountain meadows and glaciated valleys. It flows through a narrow canyon at the lower end which is typical of many rivers.

RANKING: Average.

Fish The anadromous and resident fish habitat is low.

RANKING: Below Average.

Wildlife There is a large amount of high quality old growth habitat and some marsh habitat in this river bottom. This area is average for wildlife diversity.

RANKING: Average.

Cultural/Historical The drainage provided a travelway and access for acquiring food and household materials prehistorically. There is a known peeled cedar site and there are identified camp sites. Low intensity fur trapping occurred within historic times.

RANKING: Average.

Other Values The area has old growth habitats of Douglas-fir and white fir as well as the marsh land.

RANKING: Average.

Conclusion

While there are above average resource values within the Cooper River and its adjacent forests, none are "outstandingly remarkable." The Cooper River **is not eligible** for Wild and Scenic River consideration. Classification of the river segments and determination of suitability is not necessary.

KACHESS RIVER

Total miles of river to the confluence with the Yakima River at Easton Lake is 2.5 miles. The entire 2.5 miles are within the Wenatchee National Forest boundary of which 1.0 mile is State of Washington or private land. In addition to these miles, there is a significant distance (approximately 10 miles) impounded by the Kachess Dam.

Within the river corridor, the approximate mileage and acreage by ownership is:

Ownership	River Miles	Corridor Acres*
Wenatchee National Forest	1.25	400
State of Washington	0.75	240
Private	0.50	160
Total	2.50	800

*Acres based on an estimated 1/4 mile corridor on each side of the river

The Kachess River originates just outside the Alpine Lakes Wilderness (two of its tributaries extend into the Wilderness for short distances), and flows south to its confluence with the Yakima River. The Kachess is impounded for a significant length. Vegetation consists of mixed conifer timber types with frequent natural openings.

The river is paralleled for only a short distance at its upper end by Forest Road #4600, however, Kachess Lake has roads on the east and west shorelines. There are additional roads near the lake for short distances, and the adjacent landscape has been modified in places through vegetative manipulation during timber harvest.

Recreation in the drainage is primarily camping, fishing, and boating on the lake. There is one major Forest Service developed campground as well as some undeveloped sites used for camping.

Eligibility Determination - Description and Rating of Values

Scenery The landform is dissected by ridges and moderately steep slopes. The river and tributary streams have some rapids and cascades. The drainage contains heavy to scattered timber stands with frequent natural openings and small to medium size rock outcrops.

RANKING: Average.

Recreational Some of the roads in the drainage serve as an access route to the Alpine Lakes Wilderness from Interstate 90. Use along the river and lake is primarily for fishing, boating, camping and hunting.

RANKING: Below Average.

Geologic The glaciated terrain is sloping to rolling with some rock outcrops, which is typical of most east slope Cascade creeks.

RANKING: Below Average.

Fish The anadromous and resident fish habitat is low to moderate. There is low potential for developing new runs and increasing the existing runs of anadromous fish due to the Easton Dam on the Yakima River. This river has been a spawning stream for a sensitive species, bull trout.

RANKING: Average.

Wildlife There is average riparian and old growth habitat as well as average diversity in this drainage. There are spotted owls, Rocky Mountain elk and mule deer.

RANKING: Average.

Cultural/Historical Some prehistoric use was likely (as a hunting, fishing and travel corridor), although there are no known archaeological sites. Historically, there was low intensity mining and trapping.

RANKING: Below average.

Other Values The area has no distinct features and ecotypes are common.

RANKING: Below average.

Conclusion

There are no above average resource values within the Kachess River and its adjacent forests. The occurrence of a dam causes a significant segment of the river to not meet the free-flowing criteria. The Kachess River is **not eligible** for Wild and Scenic River consideration. Classification of the river segments and determination of suitability is not necessary.

TEANAWAY RIVER

Total miles of river, which includes the three forks, is approximately 53.0 miles to the confluence with the Yakima River. There are 24.5 miles within the Wenatchee National Forest boundary of which 6.5 miles flow through private land. The remaining 28.5 miles outside the boundary are private lands. Approximately 0.5 miles inside and outside the Forest boundary flow through scattered tracts of State of Washington land.

Within the river corridor, the approximate mileage and acreage by ownership is:

Ownership	River Miles	Corridor Acres*
Wenatchee National Forest	18.0	5,760
State of Washington	0.5	160
Private	34.5	11,040
Total	53.0	16,960

*Acres based on an estimated 1/4 mile corridor on each side of the river.

The Teanaway River originates on National Forest land south of the Alpine Lakes Wilderness, and is paralleled by highways and roads for much of its length outside of the National Forest boundary. There are no major impoundments, however, there are some irrigation diversions on private land. There is considerable development along the river, with continuous signs of human occupancy below the Forest boundary. Vegetation consists of mixed conifer trees in the upper portions of the three forks; Douglas-fir and ponderosa pine types change to ponderosa pine and grass-shrub types with grasslands and hay meadows in the lower portion.

The river is closely paralleled by State Highway 97, County Road 970, private roads and Forest roads. There are additional roads which follow the river or the three forks for short distances. The Middle and West Forks of the river have only limited roading.

Recreation is primarily camping, fishing, hunting, and scenery viewing from the State Highway and Forest roads. There are three Forest Service developed campgrounds in the North Fork drainage and four non-Forest Service recreation sites outside of the Forest boundary. There are numerous undeveloped sites used for camping.

Eligibility Determination - Description and Rating of Values

Scenery The landform is dissected by ridges with steep to moderate slopes. Rivers and tributary streams have rapids and cascades with a meandering river bottom in the West Fork. The view is one of mixed conifers, scattered timber, with natural openings and some small to medium size rock outcrops.

RANKING: The main Teanaway, Middle and West Forks are rated Average. North Fork is rated Above Average.

Recreational The North Fork serves as an access route to the Alpine Lakes Wilderness from the south. There is both transitory use along the river due to the State Highway, and destination use primarily for camping, fishing, hunting, and boating by users from the Yakima and Tri-Cities area from the east and the Puget Sound area from the west.

RANKING: The main River, Middle and West Forks are rated Average. North Fork is rated Above Average.

Geologic The terrain is gently sloping in the lower portion with some rock outcrops and dissected portions in the upper reaches. This is typical of most east slope Cascade rivers at these elevations.

RANKING: Average.

Fish The anadromous and resident fish habitat is low to moderate.

RANKING: Average.

Wildlife Much of the riparian habitat has been disturbed by private landowners in this high elevation, flat bottomed drainage.

RANKING: The main River and North Fork are rated Average. Middle Fork and West Fork are rated Above Average.

Cultural/Historical There was some use by Yakima Indians for hunting, fishing and berry collecting expeditions. There are historic mining claims along the Middle Fork and North Fork as well as remnants of a Mine-to-Market road along the Middle Fork.

RANKING: Average.

Other Values This area is ecologically common to the Forest.

RANKING: Average.

Conclusion

While there are above average resource values associated with the Teanaway River and its adjacent forests, none are "outstandingly remarkable." The Teanaway River **is not eligible** for Wild and Scenic River consideration. Classification of the river segments and determination of suitability is not necessary.

ENTLAT RANGER DISTRICT

MAD RIVER

Total miles of river to the confluence with the Entiat River is approximately 24.0 miles. All of the 24.0 miles are within the Wenatchee National Forest boundary. Approximately 2.0 miles are on private land.

Within the river corridor, the approximate mileage and acreage by ownership is:

Ownership	River Miles	Corridor Acres*
Wenatchee National Forest	22.0	7,040
Private	2.0	640
Total	24.0	7,680

*Acres based on an estimated 1/4 mile corridor on each side of the river.

The Mad River originates along a divide between the Entiat and Chiwawa Rivers, and is free-flowing for most of its length. There are minor diversions and impoundments in the lower three miles. Topography ranges from a meandering stream at its upper end to a cascading stream in a narrow steep canyon at the lower end. Vegetation type ranges from open high elevation meadows through mixed conifer to Douglas-fir and ponderosa pine types.

The river is paralleled by trail #1409 for most of its length. The lower four miles are paralleled by Forest road #5700 to Pine Flat campground. Some land adjacent to the river has been modified by private land development, the 1970 fires, and timber harvest and roading. Access to the river is provided by Forest roads, spur roads and developed trails.

Recreation is primarily trailbike riding, camping, fishing, hiking and hunting. There is one Forest Service developed campground and several undeveloped sites used for camping. There is no known use of the river by boaters.

Eligibility Determination - Description and Rating of Values

Scenery The drainage has mountain meadows with moderate slopes, to cascades with steep slopes and rock outcrops. There is a mixed conifer river bottom with some hardwoods.

RANKING: Above average.

Recreational Use along the river is primarily trailbike riding, camping, fishing, hiking and hunting.

RANKING: Above average.

Geologic The river rises in meandering meadows and flows through a steep, V-shaped canyon. There are numerous steep, cascading segments with rock outcrops.

RANKING: Above Average.

Fish There are good pool-riffle ratios and the possibility exists that a sensitive species (bull trout) occurs in this drainage. There is average resident trout use and some anadromous fisheries.

RANKING: Above Average.

Wildlife The area along the river is average riparian habitat with clearcuts and large burns of varying ages nearby. Mule deer and grouse are the most common species seen in this area.

RANKING: Average.

Cultural/Historical The upper Mad River country was reportedly used by the Wenatchi Indians, who approached the area via Alder Creek. There was some early recreational use and sheep grazing in historic times.

RANKING: Below average.

Other Values There is at least one sensitive plant species in this drainage. The lower river area has been burned or logged in the last 50 years.

RANKING: Above average.

Conclusion

While there are above average resource values within the Mad River and its adjacent forests, none are “outstandingly remarkable.” The Mad River **is not eligible** for Wild and Scenic River consideration. Classification of the river segments and determination of suitability is not necessary.

NORTH FORK ENTIAT RIVER

Total miles of river to the confluence with the Entiat River is approximately 9.2 miles. All of the 9.2 miles are within the Wenatchee National Forest boundary and all are on National Forest lands.

Within the river corridor, the approximate mileage and acreage by ownership is:

Ownership	River Miles	Corridor Acres*
Wenatchee National Forest	9.2	2,944
Total	9.2	2,944

*Acres based on an estimated 1/4 mile corridor on each side of the river.

The North Fork Entiat River originates east of the Glacier Peak Wilderness in the Entiat Valley and is free-flowing for its entire length. Topography ranges from a glaciated headwall area to a V-shaped valley, and then to a somewhat narrow canyon at the lower end. Vegetation type is primarily high mountain meadows, brushy areas, and mixed conifer.

The river is paralleled by trail #1437 for most of its length, except in the lower two miles where Forest access roads climb on both sides of the drainage. Some land adjacent to the river is modified through timber harvest and roading in the lower two miles. Access to the river is provided by Forest roads, spur roads and developed trails.

Recreation is primarily camping, fishing and hunting. There is one Forest Service developed campground and some undeveloped sites used for camping. There is no known use of the river by boaters.

Eligibility Determination - Description and Rating of Values

Scenery The drainage is characterized by peaks, rocky areas, some cliffs, steep slopes, and meadows. The river has cascades and falls, mixed conifers and some old growth forests.

RANKING: Above average.

Recreational Use along the river is primarily hiking, fishing, and hunting. The drainage serves as an access to the Glacier Peak Wilderness.

RANKING: Average.

Geologic The river rises in seasonal snowfields with mountain meadows and a V-shaped valley. It flows through a narrow canyon at its lower reach.

RANKING: Above Average.

Fish Entiat Falls blocks anadromous fish from using this stream and the use by resident fisheries is limited.

RANKING: Average.

Wildlife The riparian vegetation has some old growth habitat but most of the habitat in the vicinity is about 100 years old as a result of past fires. Woodpeckers and spotted owls frequent this area as do mule deer.

RANKING: Average.

Cultural/Historical No known prehistoric sites have been identified. There was likely some early hunting and other backcountry use by the Entiat Indians. Historic use was minimal, with the exception of some small scale fur trapping.

RANKING: Below Average.

Other Values This area is ecologically common on the Forest.

RANKING: Average.

Conclusion

While there are above average resource values within the North Fork Entiat River and its adjacent forests, none are "outstandingly remarkable." The North Fork Entiat River **is not eligible** for Wild and Scenic River consideration. Classification of the river segments and determination of suitability is not necessary.

NACHES RANGER DISTRICT

BUMPING RIVER

Total miles of river to the confluence with the Naches River is 28 miles. All of the 28 miles are within the Wenatchee National Forest boundary and 0.5 miles pass through private land. Eight of these miles occur above Bumping Lake, and the remainder are below the Bumping Lake dam.

Within the river corridor, the approximate mileage and acreage by ownership is:

Ownership	River Miles	Corridor Acres*
Wenatchee National Forest	24.0	7,680
Private	0.5	120
Total	24.5	7,800

*Acres based on an estimated 1/4 mile corridor on each side of the river.

The Bumping River originates east of the Cascade Crest in the William O. Douglas Wilderness. The river is impounded by the Bumping Lake Dam. It is free-flowing below the dam from Bumping Crossing to its confluence with the Naches River. There is also a free-flowing segment above the lake within the wilderness. Topography below the dam consists of a glaciated valley in the west, narrowing at the east due to volcanic formations. Vegetation consists of Douglas-fir and ponderosa pine types.

The river is closely paralleled by Bumping River Road No. 18 for most of its length. The lower 2.5 miles flows adjacent to the Mather Memorial Highway, while the upper 7 miles are within the wilderness. Access to the river is by State Highway, Forest roads, spur roads, and by trail in the wilderness.

Recreation is primarily camping and fishing. Scenery viewed from the State Highway and Forest roads is rated high. There are five Forest Service developed campgrounds and numerous undeveloped sites used for camping. Boating is limited to intermediate kayaking and rafting.

Eligibility Determination - Description and Rating of Values

Scenery The drainage contains snowfields, peaks rising above 5,000 feet, steep slopes, a meandering river course, cascading water, mixed forest river bottom, and old growth forest.

RANKING: Above average.

Recreational The drainage serves as a major access route to the William O Douglas Wilderness from the east side. Use along the river is primarily for camping, fishing, hunting, and boating by users from the Yakima and Tri-Cities area from the east and the Puget Sound area from the west.

RANKING: Above average.

Geologic The river rises in seasonal snowfields with meadows, similar to most rivers of the Wenatchee Forest; it is a typical narrow, steep river valley with cascading water.

RANKING: Average.

Fish The spring chinook and steelhead runs are low but the potential for these species is high. There is a good resident fishery. The sensitive species (bull trout) inhabits this river.

RANKING: Above average.

Wildlife The mature, old growth and riparian vegetation is average for this area. Some common species are barred owls, Rocky Mountain elk, and mule deer. Bald eagles and peregrine falcons feed along the river.

RANKING: Average.

Cultural/Historical The Yakima Indians used the river for fishing and backcountry access, and there are several known archaeological sites. There were historic water reclamation developments and the drainage was used by miners, loggers, fur trappers, and early settlers and recreationists.

RANKING: Above average.

Other Values This area has some unusually high water tables that contribute to the dominance of western red cedar in the forest stands.

RANKING: Above average.

Conclusion

While there are above average resource values within the Bumping River and its adjacent forests, none are "outstandingly remarkable." The occurrence of a dam causes a significant segment of the river to not meet the free-flowing criteria. The Bumping River is not eligible for Wild and Scenic River consideration. Classification of the river segments and determination of suitability is not necessary.

LITTLE NACHES RIVER

Total miles of river to the confluence with the Naches River is 12.0 miles. All of the 12.0 miles are within the Wenatchee National Forest boundary and 0.75 miles are on private land.

Within the river corridor, the approximate mileage and acreage by ownership is:

Ownership	River Miles	Corridor Acres*
Wenatchee National Forest	11.25	3,600
Private	0.75	240
Total	12.00	3,840

*Acres based on an estimated 1/4 mile corridor on each side of the river.

The Little Naches River originates east of the Cascade Crest and north of Naches Pass. The river has had straightening, riprapping and channeling over a significant portion of its length due to rehabilitation after flooding. Topography ranges from a broad glaciated valley to a narrow steep-walled canyon at the lower end. Vegetation types run from mixed conifer forest in the upper end, to Douglas-fir and ponderosa pine types in the lower reaches.

The river is paralleled for most of its length by the Naches Pass Road #19 which provides access to the river from State Highway 410.

Recreation is primarily camping, fishing and hunting, with many of the trails used by ORV's. There are four Forest Service developed campgrounds and eight undeveloped sites used for camping. There is no known use of the river by boaters.

Eligibility Determination - Description and Rating of Values

Scenery Terrain in the drainage is steep sloping to rolling, a cascading and meandering river course, continuous cover with mixed conifer forest and some old growth adjacent to the river.

RANKING: Above average.

Recreational Use along the river is primarily camping, fishing, and hunting, with off-road vehicle use on adjacent trails.

RANKING: Average.

Geologic The river rises in seasonal snowfields with mountain meadows and glaciated valleys. It flows through a narrow canyon at the lower end which is typical of many rivers.

RANKING: Average.

Fish The spring chinook and steelhead runs are low but the potential for these species is moderate. There is a good resident fishery.

RANKING: Average.

Wildlife There is some use for feeding by bald eagles and peregrine falcons. Mule deer and Rocky Mountain elk commonly use the river and tributaries.

RANKING: Average.

Cultural/Historical There was intensive prehistoric use, with several known archaeological sites, and one identified Indian cultural site. The anadromous fishery is important to the Yakima Indians. The drainage was a major historic travelway to Puget Sound for Indians, explorers, military expeditions, cattle drives and wagon train parties (Naches Trail).

RANKING: Outstandingly remarkable.

Other Values This area is ecologically common to the Forest.

RANKING: Average.

Conclusion

While there are "outstandingly remarkable" values within the Little Naches River and its adjacent forests, the river does not meet the free-flowing criteria due to the extensive flood rehabilitation work. This included straightening and riprap in addition to modification of much of the stream bank. The Little Naches River is not eligible for Wild and Scenic River consideration. Classification of the river segments and determination of suitability is not necessary.

NACHES RIVER

Total miles of river from the confluence of the Little Naches and Bumping Rivers to the confluence with the Tieton River is 24.5 miles. There are 9.0 miles within the Wenatchee National Forest boundary of which 1.0 is private. The remaining 15.5 miles outside the boundary flow through State of Washington and private lands.

Within the river corridor, the approximate mileage and acreage by ownership is:

Ownership	River Miles	Corridor Acres *
Wenatchee National Forest	8.0	2,560
State of Washington	3.0	960
Private	13.5	4,320
Total	24.5	7,840

*Acres based on an estimated 1/4 mile corridor on each side of the river.

The Naches River originates at the confluence of the Little Naches and Bumping Rivers, and follows State Highway 410 for its entire length. There are no major impoundments, however, there are some irrigation diversions and one diversion dam on private land (less than 4 feet high). There is considerable development along the river and there are continuous signs of human occupancy. Vegetation consists of Douglas-fir and ponderosa pine types, changing to Ponderosa pine and grass-shrub types surrounding the lower portion.

The river is closely paralleled by State Highway 410, Nile Road, and the Old River Road. There are additional roads which follow the river for short distances. Access to the river is by State Highway, Forest roads, County road, private roads, spur roads and by trail.

Recreation is primarily camping, fishing and boating. Scenery viewed from the State Highway and Forest roads is rated average. There are four Forest Service developed campgrounds and some undeveloped sites used for camping. Boating includes rafting and kayaking.

Eligibility Determination - Description and Rating of Values

Scenery The drainage is characterized by gently sloping to rolling terrain, rock outcrops and some basalt cliffs, and a meandering river course. Mixed conifer with hardwood types and some scattered old growth forest are found along the river.

RANKING: Average.

Recreational The drainage serves as an access route to Mt. Rainier National Park from the Yakima area. The river receives both transitory use due to the State Highway, and destination use primarily for camping, fishing, hunting, and boating by Yakima and Tri-Cities area residents from the east and the Puget Sound area residents from the west.

RANKING: Above Average.

Geologic The terrain is gently sloping with some rock outcrops and basalt cliffs, which is typical of most east slope Cascade rivers at mid and lower elevations.

RANKING: Average.

Fish The spring chinook and steelhead runs are low but the potential for these species is high. There is a good resident fishery.

RANKING: Above average.

Wildlife There is some use by wintering bald eagles and peregrine falcons. Mule deer and Rocky Mountain elk commonly use the river and tributaries. However, heavy human use and settlement lessens the value of wildlife habitat in the corridor.

RANKING: Below Average.

Cultural/Historical There was intensive prehistoric use, with several known archaeological sites. The river supports a major anadromous fishery. There was early historic settlement and the drainage was a key area during military expeditions of the 1850's, particularly along downstream stretches. An historic CCC camp and National Register-eligible former Ranger Station compound are located within the corridor, although these do not derive significance from, nor contribute directly to, the uniqueness of the Naches River.

RANKING: Above average.

Other Values This area is ecologically common to the Forest.

RANKING: Average.

Conclusion

While there are above average resource values within the Naches River and its adjacent forests, none are "outstandingly remarkable." The Naches River **is not eligible** for Wild and Scenic River consideration. Classification of the river segments and determination of suitability is not necessary.

RATTLESNAKE CREEK

Total miles of creek to the confluence with the Naches River is 21.5 miles. There are 17.0 miles within the Wenatchee National Forest boundary of which 10.0 miles are within the William O. Douglas Wilderness. Of the remaining 4.5 miles outside of the National Forest boundary, 2.25 miles flow through State of Washington lands and 2.25 miles through private lands.

Within the river corridor, the approximate mileage and acreage by ownership is:

Ownership	River Miles	Corridor Acres*
Wenatchee National Forest	17.00	5,440
State of Washington	2.25	720
Private	2.25	720
Total	21.50	6,880

*Based on an estimated 1/4 mile corridor on each side of the river.

Rattlesnake Creek originates within the William O. Douglas Wilderness and flows east to its confluence with the Naches River. The Creek is free-flowing for its entire length. Vegetation consists of mixed conifer, Douglas-fir and ponderosa pine types, changing to ponderosa pine and grass-shrub types at the lower portion.

The creek is paralleled by Forest Road #1500 for part of its length outside of the wilderness. There are additional roads which follow the creek for short distances, and the surrounding landscape is modified in places through vegetative manipulation during timber harvest.

Recreation is primarily hunting and fishing. There is one State of Washington developed campground and some undeveloped sites used for camping.

Eligibility Determination - Description and Rating of Values

Scenery The drainage has steep sloping to rolling terrain, rock outcrops, talus river gorges, and basalt cliffs; with some waterfalls and cascading water through the creek gorges. Vegetation is mixed conifer, with some old growth forest.

RANKING: Above average.

Recreational The drainage serves as an access route to the east side of the William O. Douglas Wilderness from the Yakima area. Use along the creek is primarily for fishing and hunting by local users, with a high opportunity for solitude within the wilderness.

RANKING: Average.

Geologic The terrain is sloping to rolling with some rock outcrops and basalt cliffs, which is typical of most east slope Cascade creeks.

RANKING: Average.

Fish The spring chinook and steelhead runs are low but the potential for these species is high. There is a good resident fishery.

RANKING: Above average.

Wildlife This area has spotted owl, Rocky Mountain elk, and mule deer. There are unique habitats such as cliffs and rims on one side of the river, and some deciduous woodlands habitat.

RANKING: Above Average.

Cultural/Historical The drainage has high cultural values for the Yakima Indians. The major historic use was sheep grazing.

RANKING: Average.

Other Values There is a high variety of ecotypes in this drainage.

RANKING: Above average.

Conclusion

While there are above average resource values within Rattlesnake Creek and its adjacent forests, none are “outstandingly remarkable.” Rattlesnake Creek **is not eligible** for Wild and Scenic River consideration. Classification of the river segments and determination of suitability is not necessary.

TIETON RIVER

The total miles of river from the confluence of the Tieton River and Wildcat Creek to the confluence with the Naches River is 18.75 miles. There are 12.5 miles within the Wenatchee National Forest boundary of which 2.75 miles of the river are private. The remaining 6.25 miles outside the boundary flows through State of Washington and private lands.

Within the river corridor, the approximate mileage and acreage by ownership is:

Ownership	River Miles	Corridor Acres*
Wenatchee National Forest	9.75	3,120
State of Washington	3.25	1,040
Private	5.75	1,840
Total	18.75	6,000

*Acres based on an estimated 1/4 mile corridor on each side of the river.

The Tieton River originates east of the Cascade Crest in the Goat Rocks and the William O. Douglas Wildernesses. The river is impounded by two dams: Clear Lake and Rimrock. Flow is frequently manipulated throughout the year to meet downstream irrigation purposes. Fluctuating water levels detract from the naturalness of the river from Clear Lake to the Naches River. It is free-flowing below Rimrock Dam from Wildcat Creek to its confluence with the Naches River. The topography is a narrow canyon of volcanic formations through which the river has cut its way. Vegetation consists of Douglas-fir and ponderosa pine types.

The river is closely paralleled by State Highway 12 for most of its length. There are additional roads which follow the river for short distances on the south bank. Access to the river is by State Highway, Forest roads, spur roads and by trail in the wilderness areas.

Recreation is primarily camping, fishing and boating. Scenery viewed from the State Highway and Forest roads is rated high. There are five Forest Service developed campgrounds and numerous undeveloped sites used for camping.

Eligibility Determination - Description and Rating of Values

Scenery There are snowfields, mountain meadows, steep slopes to rolling terrain, with old growth forests above the dams. River gorges, and mixed forest river bottom typify the river below the dams.

RANKING: Above average.

Recreational Highway 12 serves as an access route to the White Pass Ski Area from the Yakima area. There is both transitory use along the river from travelers of the State Highway, as well as destination camping, fishing, hunting, and boating by users from the Yakima and Tri-Cities areas from the east and the Puget Sound area from the west.

RANKING: Above average.

Geologic The river flows from snowfields and mountain meadows in glaciated valleys above the dams. The river canyon has some steep rocky walls below the dams.

RANKING: Above average.

Fish Since the building of the Rimrock Lake impoundment the spring chinook and steelhead runs have been small. There is a good resident fishery.

RANKING: Average.

Wildlife The mature, old growth and riparian vegetation is average for this area. The species most commonly seen are Rocky Mountain elk and mule deer.

RANKING: Average.

Cultural/Historical There was intensive prehistoric use of the Tieton with settlements as far upriver as Rimrock. Included are several known archaeological sites and recorded pictograph localities of varying degrees of integrity. There are also historic irrigation and transportation developments of National Register significance within the drainage. Among the historic irrigation developments are the major impoundments of the river. An historic CCC work camp and a National Register-eligible former Ranger Station compound are located within the corridor, although these do not derive their significance from, nor contribute directly to, the uniqueness of the Tieton River.

RANKING: Above average.

Other Values This area is ecologically common to the Forest.

RANKING: Average.

Conclusion

While there are above average resource values within the Tieton River and its adjacent forests, none are “outstandingly remarkable.” The occurrence of dams causes a significant segment of the river to not meet the free-flowing criteria. The Tieton River is not eligible for Wild and Scenic River consideration. Classification of the river segments and determination of suitability is not necessary.

III. CLASSIFICATION AND SUITABILITY ANALYSIS

Based on the assessment of eligibility by an Interdisciplinary team (ID team), ten of the twenty rivers analyzed on the Wenatchee National Forest were considered eligible for designation under the Wild and Scenic Rivers Act. It was determined by the ID team that the ten rivers were essentially free-flowing and had at least one “outstandingly remarkable” value. Ten rivers were determined not to be eligible because they did not meet one or both of the eligibility criteria.

Each eligible river or river segment was assigned to one of three potential classes, based on the condition of the river and the adjacent lands as they presently exist. These classifications are defined in the Wild and Scenic Rivers Act as follows:

1. **Wild River Areas** - Those rivers or sections of rivers that are free of impoundments and are generally inaccessible except by trail, with watersheds or shorelines essentially primitive and waters unpolluted. These represent vestiges of primitive America.
2. **Scenic Rivers Areas** - Those rivers or sections of rivers that are free of impoundments, with shorelines or watersheds still largely primitive and shorelines largely undeveloped, but accessible in places by roads.
3. **Recreational River Areas** - Those rivers or sections of rivers that are readily accessible by road or railroad, that may have some development along their shoreline and that may have undergone some impoundment or diversion in the past.

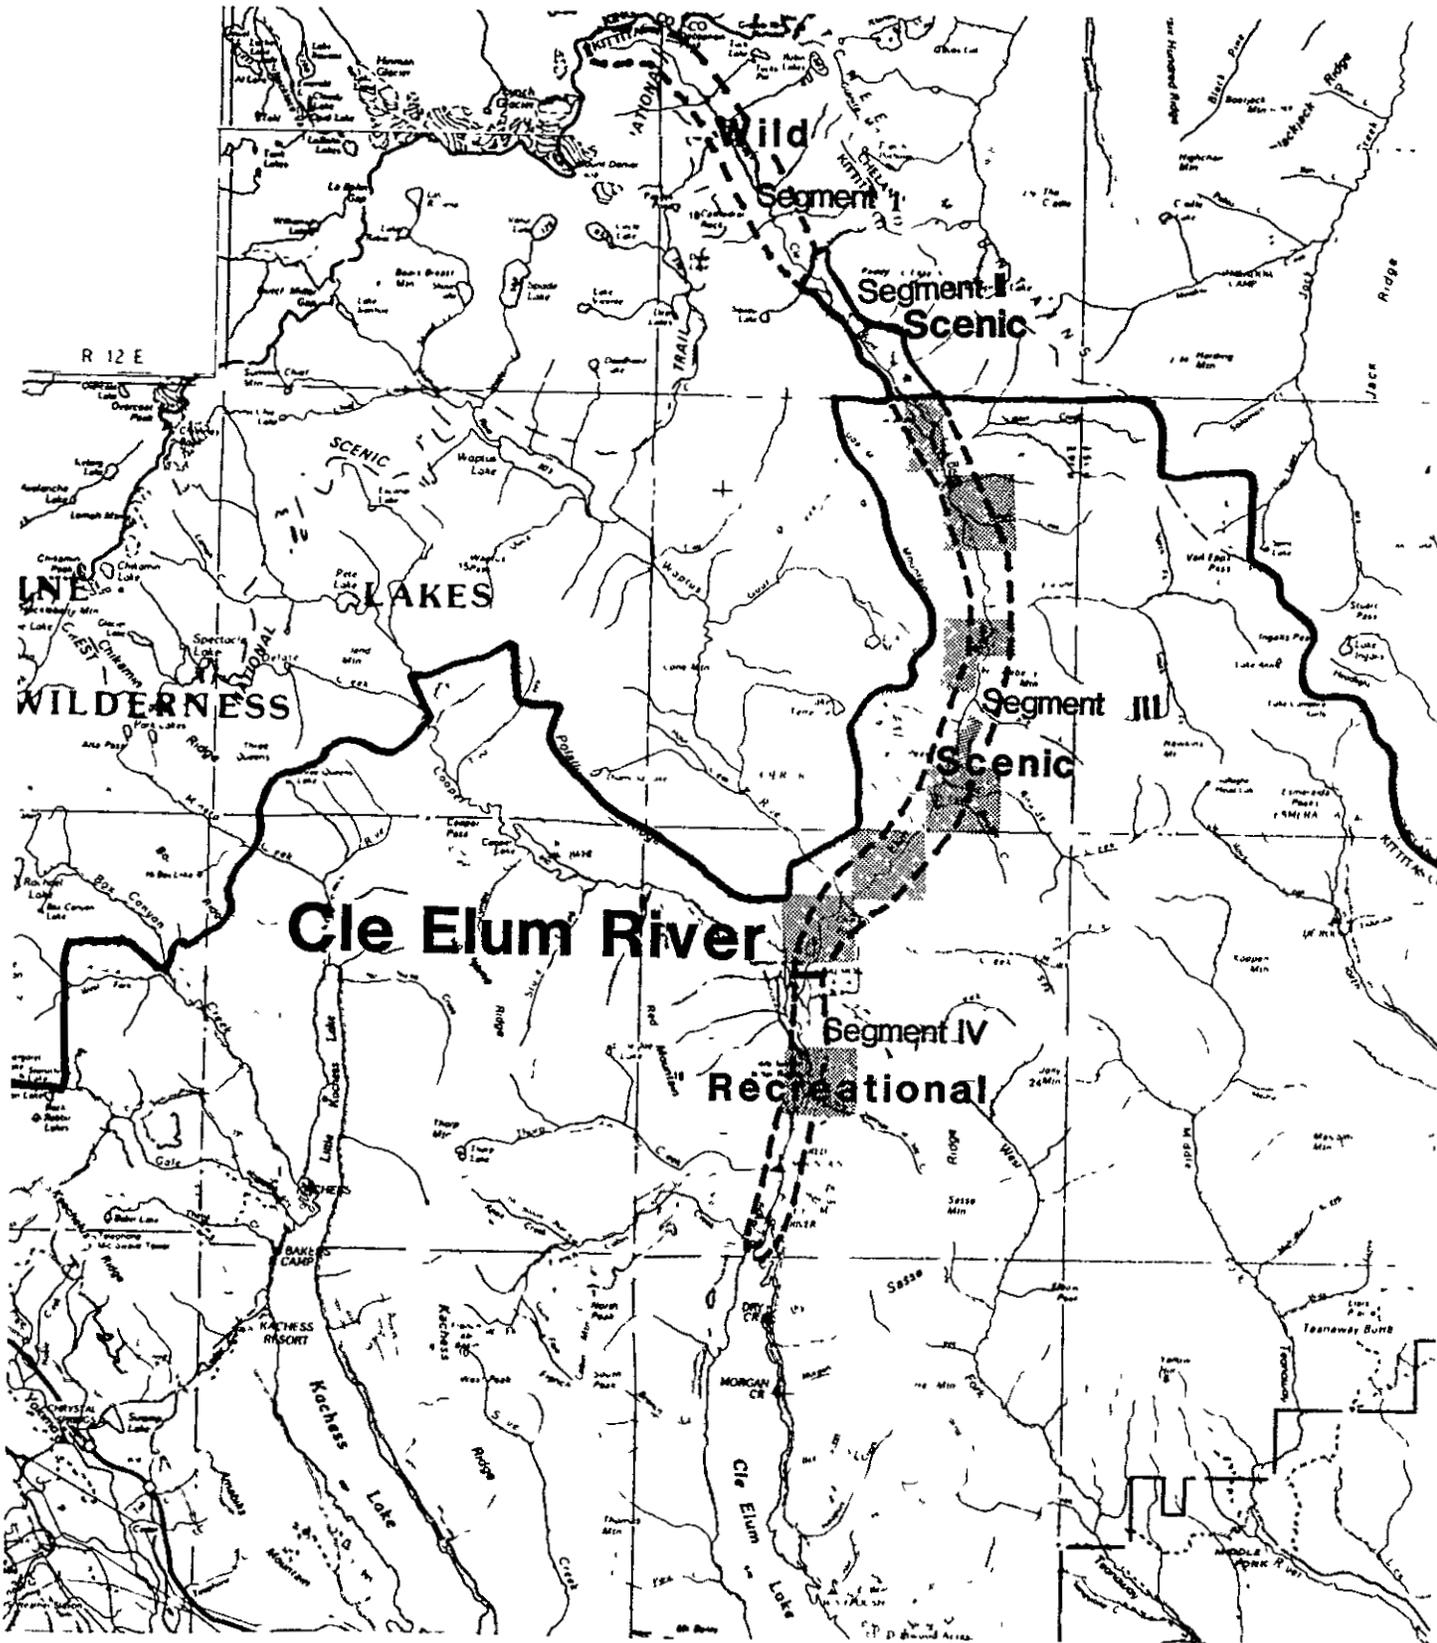

Following classification, a suitability analysis was conducted for each eligible river. This analysis provides the basis for the decision to recommend designation or nondesignation of an eligible river. The factors considered by the ID team in the determination of suitability of the eligible rivers and river segments on the Wenatchee National Forest were:

1. The characteristics that do or do not make the area a worthy addition to the system.
2. The current status of land ownership and use in the area.
3. The reasonably foreseeable potential uses of the land and water which would be enhanced, foreclosed, or curtailed if the area were included in the Wild and Scenic Rivers System, and the values which could be foreclosed or diminished if the area is not protected as part of the System.
4. Public, state, and local governmental interest in designation of the river, including the extent to which the administration of the river, including the costs thereof, may be shared by state and local agencies.
5. The estimated cost of acquiring necessary lands and interests in land and of administering the area if it is added to the System.
6. Other issues and concerns identified during the planning process.

The State of Washington is currently conducting an assessment of eighteen rivers in the State which possess the natural, cultural and recreational values that would make them suitable additions to the Washington State Scenic Rivers System. Among these eighteen is the Wenatchee River, from its outlet at Lake Wenatchee to its confluence with the Columbia River. The Forest Service study of the Wenatchee River is confined to those segments of the corridor located within the Wenatchee National Forest boundary. These segments were determined to be eligible for inclusion in the Wild and Scenic River System, and were recommended for further evaluation.

The results of the suitability analysis for each of the eligible rivers or river segments on the Forest are presented below, by Ranger District. In addition, a series of administrative and management guidelines are presented at the conclusion of the Appendix. These guidelines are proposed to guide the development of detailed management plans for those rivers on the Wenatchee National Forest that are Congressionally designated as Wild and Scenic Rivers.

CLE ELUM RIVER

Private Land 

CLE ELUM RANGER DISTRICT

CLE ELUM RIVER

Classification:

The Cle Elum River, from the headwaters to the head of the Lake Cle Elum Reservoir, is considered to be eligible for inclusion in the Wild and Scenic River system. In the course of determining eligibility, four distinct segments of the river were identified, based on a combination of physical changes in the river character, and differences in landownership and development along the river corridor. These segments consist of an upper section (Segment 1) extending from the headwaters in the NW 1/4 of Section 12, T.24N., R.13E. to the Alpine Lakes Wilderness boundary in the NW 1/4 of Section 28, T.24N., R.14E.; an upper middle section (Segment 2) extending from the wilderness boundary to the private land boundary at the north section line of Section 3, T.23N., R.14E.; a lower middle section (Segment 3) extending from the private land boundary to the Salmon La Sac bridge in the NW 1/4 of Section 16, T.22N., R.14E.; and a lower section (Segment 4) extending from the bridge to the head of Lake Cle Elum.

Based on their highest potential classification, Segment 1 meets the standards for classification as a Wild River, Segments 2 and 3 as a Scenic River, and Segment 4 as a Recreational River.

Segment 1

Segment 1, which is located entirely within the Alpine Lakes Wilderness, is approximately four miles in length. Trail #1376 parallels the river through much of the segment, and the Pacific Crest Trail intersects and crosses the corridor in the NW 1/4 of Section 28, T.24N., R.14E., near the headwaters. A public road easement, held by Kittitas County, extends from the end of the existing road in Section 28, T.24N., R.14E., to Hyas Lake. This two-mile-long easement, which is nearly all within the wilderness, was acquired by Kittitas County in 1888 for a Mine to Market Road, but the segment was never constructed. The Forest is recommending that the County abandon the easement.

Segment 2

Segment 2 is approximately two miles in length, and flows exclusively through National Forest land. Public Road #4330 follows the northeast side of the river through this segment, to the wilderness boundary. Other developments within Segment 2 are primarily small scale and recreation oriented. Hyas Lake Trailhead, at the end of the road, is a minimally developed campsite, with picnic tables, fire rings and pit toilet. One quarter mile south of here is the Deep Creek Trailhead, with similar facilities. At the lower end of the segment is the Fish Lake Guard Station and campground, the only formally developed site in Segment 2. There is also a remote automated weather station (RAWS) site in this segment, but the small building, sensory devices and antenna are situated out of view of the river.

Segment 3

Segment 3 is 14 miles in length. The corridor here is a mix of National Forest and private lands, with approximately 71% of the acreage in private ownership, including timber industry lands as well as a block of patented mining claims. In recent years, a portion of the private timber lands within the corridor were sold as individual recreation residence lots. Public Road #4330 parallels the river its entire length within this segment. The road offers scenic views, and access to camping sites and other recreational opportunities along the river. Numerous (about 30) private homes and summer cabins are located on the private lands adjacent to the road and river.

A user-built campground is located near Scatter Creek, and at least three trailheads and several dispersed sites are situated along the corridor.

Segment 4

Segment 4 is 4.5 miles in length. The ownership here is somewhat the reverse of Segment 3, with approximately 88% of the acreage being National Forest lands. County Road #903 parallels the river through the entire segment, offering access to scenic views and recreational sites. There are three Forest Service campgrounds in the corridor: Salmon La Sac with 120 units, Cle Elum River with 32 units, and Red Mountain with 11 units. Future plans call for the upgrading of the Boston Man site in the NE 1/4 of Section 32, T.22N., R.14E., to a developed campground. Also situated along Segment 4 are both the contemporary and historic Salmon La Sac Guard Stations, the latter building being listed on the National Register of Historic Places.

Suitability:

Suitability Factor #1 -Characteristics Which Make the Area a Worthy Addition to the System

The Cle Elum River encompasses a mix of outstandingly remarkable qualities: spectacular scenery, diverse recreation opportunities, significant cultural ties with the Yakima Indian Nation, and a substantial mining history that includes a National Register property.

The area is typified by rugged peaks and steep slopes, combined with patches of wetlands, open meadows and thick forests of old growth conifer and hardwoods on the valley bottom and gentler slopes. The deep pools and cascading rapids, riffles and waterfalls attract heavy recreation use along the length of the river. As a gateway to the Alpine Lakes Wilderness, the upper river corridor also experiences significant levels of recreation use, particularly hiking and dispersed camping.

Suitability Factor #2-Current Status of Land Ownership and Use

Forty-five percent of the Cle Elum River corridor is in private ownership, with most of these holdings being located in Segment 3. Plum Creek Timber Company is the primary landowner in this latter segment, but in recent years, Plum Creek has sold portions of their property as individual recreation residence lots. If this trend continues, there may be increasing sales of small parcels along the river for recreation use or development.

Under the Kittitas County Zoning regulations, the Cle Elum River above Lake Cle Elum is zoned as Forest and Range. Minimum lot size restrictions range from 7,200 square feet to one acre, depending upon the provisions for water and sewer systems. Cluster development is permitted provided community or public open spaces are retained. Minimum lot width is 60 to 100 feet, with a 100 foot setback requirement. Such industrial uses as timber harvest, mining, quarrying, and gas and oil exploration are permitted. However, under the State Forest Practices Act as well as the State Shoreline Management Act, more restrictive uses would apply.

National Forest lands below the wilderness boundary have been managed under a visual quality objective of retention, which emphasizes the scenic and recreational values of the corridor. Although timber harvest has taken place, efforts have been made to maintain the river area in its near natural condition.

Suitability Factor #3 -Foreseeable Potential Uses.

There would be no change in management of the National Forest lands as a result of designation. Segment 1 is currently managed as wilderness, which emphasizes the primitive, undeveloped character of the environment. Segments 2, 3 and 4 are currently managed under the Alpine Lakes Management Plan as a scenic corridor. The objective of this allocation is to retain or enhance the viewing and recreation experience in the Cle Elum, with timber management activities designed to meet this goal.

Mining activity has been ongoing within the corridor since the late nineteenth century, with several placer and lode claims patented in those early years. Segment 1 is now withdrawn from mineral entry because of its location within the Alpine Lakes Wilderness. However, Segments 2, 3 and 4 have been identified as being potentially valuable for coal, as well as for the occurrence of gold, silver, copper, chromite, iron and nickel. The corridor lands in Section 34, T.24N., R.14E., in Sections 2, 3, 14, 23, 26 and 34, T.23N., R.14E., and in Sections 4, 16, 28, 29 and 32 in T.22N., R.14E., were withdrawn from mineral entry under Powersite Classification No. 215, approved December 6, 1928. Public Law 359 of August 11, 1955, opened these powersite lands to mineral entry, but required, in each instance, that an analysis be done to determine the effects of placer mining on other resource uses when claims are located within the withdrawal area.

Scenic and Recreational classification would not affect continuing mining activity in the corridor. New claims and mineral leases are permitted, subject to 36 CFR 228, provided the activities are conducted in a manner that minimizes environmental degradation.

Designation might produce some effects on private lands in the corridor, particularly within Segment 3. The Scenic designation here would be compatible with the development of individual recreation residence lots. This classification allows for new structures, as long as these are modest in size, unobtrusive, and do not have a direct and adverse effect on river values. Concentrations of habitations may occur, but are limited to relatively short reaches of the river corridor. However, large scale developments or industrial uses that affect the significant river values, would have to be restricted.

Some scenic values in Segments 3 and 4 could be foreclosed if the river were not managed as part of the Wild and Scenic River System. Timber harvest on private land is controlled by State regulation. Under the State Shoreline Management Act of 1971, clearcutting is permitted to within 200 feet of the river shoreline, and selective cutting for commercial purposes within the 200 foot strip each side of the shoreline, as long as no more that 30% of the merchantable trees are harvested in any 10 year period. In addition, clearcutting incidental to preparation of the land for other uses authorized under the Shoreline Management Act may be permitted. The recently amended State Forest Practices Act further refines cutting practices within the riparian zone for the protection of wildlife habitat in these areas. In eastern Washington, a management zone of not less than 30 feet and a maximum of 50 feet is to be left on each side of the stream, the actual size of this strip being dependent upon the stream type. The zone is to be expanded where swamps, bogs, marshes and ponds occur adjacent to the water course. Selective logging is allowed within these zones, with the number of leave trees specified per thousand feet of shoreline. Road construction is also restricted within the riparian management zone. Beyond the narrow riparian strips established by the above laws, however, clearcutting, road construction and other facility development is permitted.

Although the intent of designation is to follow these existing State and County controls on private land, it is possible that designation would encourage greater sensitivity to the visual values within the Wild and Scenic corridor. In addition, designation would ensure protection of the free-flowing character of the Cle Elum River above the existing reservoir.

Suitability Factor #4 -Public, State, and Local Governmental Interest.

There has been a great deal of public support for designation of the Cle Elum River as an addition to the Wild and Scenic River System. Many have expressed the need to protect the outstanding scenic values and to maintain the excellent recreation opportunities that currently exist in the corridor. Several have expressed concerns for the present level of timber harvest along the drainage, particularly with respect to its effects on the wildlife, water quality, and visual resources of the drainage.

Kittitas County officials are strongly in favor of local control in the Cle Elum River corridor. They have indicated that the County would probably not support any proposal for inclusion of the Cle Elum River in the Wild and Scenic River System that affects their jurisdiction over private lands or their ability to riprap or carry out other erosion-control measures for the protection of their improvements. The only costs that would be shared in administration of the river would be those independent of designation, that are associated with existing County administration of the private holdings.

The Washington State Department of Wildlife is in full support of the proposed river designation, and in fact, recommends reassessment of additional rivers on the Forest for potential eligibility as Wild and Scenic Rivers. The Yakima Indian Nation, whose ceded lands include the Cle Elum River drainage, supports designation at the highest potential classification, although they have some concerns for potential conflicts between recreation use and the protection of fisheries and tribal fishing localities. The Yakima would like to be involved in any subsequent river management plans that might be developed.

If the Cle Elum River is included in the Wild and Scenic Rivers System, the Forest would rely on State and County controls for administration of private lands, to the extent that these provide adequate protection. The Forest would also recommend that a proviso be included in any Wild and Scenic legislation to allow riprapping for the preservation and protection of existing improvements.

Suitability Factor #5 -Cost of Acquisition and Interests.

There are no foreseeable plans to acquire lands or interests in lands along the Cle Elum River. Acquisition of easements from private landowners would occur only if key values were in jeopardy, and local government could not provide the necessary protection.

Costs associated with designation are related to planning and administration of the river corridor and are primarily directed to National Forest lands. The following are the expected funding needs for the Cle Elum River for a total five year period:

	<i>Expenses Expected Independent of Designation</i>	<i>Additional Expenses Expected with Designation</i>
General Administration	\$ 4,000	\$ 20,000
Costs of Implementation		\$ 25,000
Development of Management Plan		\$110,000
Development Costs		\$100,000
Operation and Maintenance Costs	\$ 6,000	\$ 15,000
Total - First Five Years	\$10,000	\$ 270,000

General administration and operation and maintenance costs are estimated to continue at \$9,000 annually.

Suitability Factor #6-Other Issues and Concerns

No other major issues or concerns have been identified.

WAPTUS RIVER

WAPTUS RIVER

Classification

The Waptus River, from the headwaters to the confluence with the Waptus River, is considered to be eligible for inclusion in the Wild and Scenic River System. In the course of determining eligibility, two distinct segments of the river were identified, based on the location of the corridor with respect to the Alpine Lakes Wilderness boundary. These segments consist of an upper section (Segment 1) extending from the headwaters above Lake Ivanhoe, in the SE 1/4 of Section 29, T.24N., R.13E., to the Alpine Lakes Wilderness boundary in the NW 1/4 of Section 4, T.22N., R.14E.; and a lower section (Segment 2) extending from the wilderness boundary to the confluence with the Cle Elum River in the SE 1/4 of Section 4, T.22N., R.14E.

Based on their highest potential classification, Segments 1 and 2 meet the standards for classification as a Wild River.

Segment 1

Segment 1, which is located entirely within the Alpine Lakes Wilderness, is approximately 12 miles in length. Trail #1310 parallels the river through two-thirds of the segment, and the Pacific Crest Trail intersects and crosses the corridor in the NE 1/4 of Section 3, T.23N., R.13E. At least four other trail systems intersect Trail #1310 from side drainages on both sides of the corridor. Above the Pacific Crest Trail, Trail #1362 provides access to within one half mile of the headwaters, and skirting Lake Ivanhoe before crossing the Cascade Crest at Dutch Miller Gap.

Segment 2

Segment 2 is one mile in length. Within the northeast boundary of the corridor are the remnants of two former clearcuts and the roads that accessed them. However, these harvest units have since regenerated and both they and the roads are discernible on the slope above the river only through a slight change in the age class and texture of the vegetation.

Suitability:

Suitability Factor #1-Characteristics Which Make the Area a Worthy Addition to the System.

Originating high in the Alpine Lakes Wilderness, this rugged, glaciated valley offers a spectacular view of the pristine, timbered landscape and adjacent snow capped peaks through which it flows. The river tumbles through two sizable mountain lakes and a series of cascades and falls, to its confluence with the equally scenic Cle Elum River. Old growth stands, interspersed with wet and dry meadow openings, offer a diversity of vegetation for viewing, particularly the latter with their profusion of wildflowers and bog-associated plants.

Suitability Factor #2-Current Status of Landownership and Use

The entire corridor is National Forest, with 12 of the 13 miles currently being managed as wilderness. Within the lower mile, the corridor is managed for a combination of scenic travel and unroaded, nonmotorized dispersed recreation.

There is one placer claim located in Segment 1, and a set of four lode claims in Segment 2, all of which have assessment work completed in 1988.

Suitability Factor #3-Foreseeable Potential Uses

Over ninety percent of the Waptus River is within wilderness, which emphasizes the primitive, undeveloped character of the environment. There would be no change in management along these upper 12 miles. Segment 2 is currently managed under the Alpine Lakes Management Plan as Scenic Forest, with an objective of retaining or enhancing viewing and recreation experiences. A small portion of the corridor is also managed for unroaded recreation. Since timber harvest is permitted within the Scenic Forest allocation, there would be a slight loss in timber production if this segment were classified as Wild.

Because Segment 1 of the Waptus River lies wholly within the Alpine Lakes Wilderness, it is withdrawn from mineral entry. The single placer claim near Trail Creek was located after this withdrawal, and thus is not a valid claim. However, there could be a conflict in Segment 2 between the four lode claims that have been located here, and a Wild classification of the river. Future development of these claims would require confirmation of prior, valid existing rights to mine before any activity could be approved. No portion of the drainage is classified as an area of critical mineral potential. However, it has been identified as prospectively valuable for coal resources, and that portion of the corridor lying in T.23-24N., R.13E. is prospectively valuable for geothermal resources.

There are probably few values that would be foreclosed or curtailed if the river were not protected as part of the System. As mentioned above, all but one mile of the river is within wilderness, and current management in the lower segment recognizes the scenic and recreational values here. The greatest potential threat to river values would be in future diversions or impoundments of the river. Designation would ensure the protection of the pristine free-flowing character of the Waptus River.

Suitability Factor #4-Public, State and Local Governmental Interests.

The public response to designation of the Waptus River as an addition to the Wild and Scenic River system has been positive. Many have expressed support for the recognition and protection of the special river values here, particularly with respect to the outstanding scenery, high recreation use, wildlife habitat, old growth stands, ecological diversity and water quality. There were no specific comments in opposition to designation of this river.

Kittitas County officials have been most concerned with how designation of rivers in general would affect their jurisdiction over private lands. However, there is no private land within the Waptus drainage.

The Washington State Department of Wildlife is in full support of the proposed river designation, and in fact, recommends reassessment of additional rivers on the Forest for potential eligibility as Wild and Scenic Rivers. The Yakima Indian Nation, whose ceded lands include the Waptus drainage, supports designation at the highest potential classification, although they have some concerns for potential conflicts between recreation use and the protection of fisheries and tribal fishing localities. The Yakima would like to be involved in any subsequent river management plans that might be developed.

Suitability Factor #5-Cost of Acquisition and Interests

There are no private lands included within the proposed Wild and Scenic corridor of the Waptus River.

Costs associated with designation are related to planning and administration of the river corridor. The following are the expected funding needs for the Waptus River for a total five year period:

	Expenses Expected Independent of Designation	Additional Expenses Expected with Designation
General Administration	\$ 1,000	\$ 1,000
Costs of Implementation		\$ 5,000
Development of Management Plan		\$ 25,000
Development Costs		\$ 5,000
Operation and Maintenance Costs	\$ 2,500	\$ 10,000
Total - First Five Years	\$ 3,500	\$ 46,000

General administration and operation and maintenance costs are estimated to continue at \$2,900 annually.

Suitability Factor #6-Other Issues and Concerns

No major issues or concerns have been identified.

ENTIAT RANGER DISTRICT

ENTIAT RIVER

Classification:

The Entiat River, from the headwaters to the private land boundary above Burns Creek, is considered to be eligible for inclusion in the Wild and Scenic River System. This part of the drainage is exclusively comprised of National Forest lands. In the course of determining eligibility, three distinct segments of the river were identified, based on a combination of physical changes in the river character and the level of development along the shoreline. These segments consist of an upper section (Segment 1) extending from the headwaters in the SE 1/4 of Section 25, T.31N., R.16E., to the Glacier Peak Wilderness boundary in the SE 1/4 of Section 27, T.30N., R.17E.; a middle section (Segment 2) extending from the wilderness boundary to the Cottonwood Trailhead in the SW 1/4 of Section 7, T.29N., R.18E.; and a lower section extending from the trailhead to the private land boundary in the NE 1/4 of Section 29, T.28N., R.19E.

Based on their highest potential classification, Segments 1 and 2 meet the standards for classification as a Wild River, and Segment 3 as a Scenic River.

Segment 1

Segment 1, which is located entirely within the Glacier Peak Wilderness, is approximately 12.5 miles in length. Access along the corridor is provided by Trail #1400, which parallels the Entiat River along its east and north bank to within one mile of the headwaters. At least six other trail systems intersect Trail #1400 from side drainages on both sides of the corridor, between the headwaters and the wilderness boundary.

Segment 2

Segment 2 is four miles in length. As in Segment 1, Trail #1400 parallels the east bank of the river. A steel girder bridge across the Entiat River links this route with the Myrtle Lake Trail #1404 in the NE 1/4 of Section 34, T.30N., R.17E. Trail #1435 also intersects Trail #1400 on the east side of the river, in the NE 1/4 of Section 2, T.29N., R.17E.

Motorized bike use is presently permitted along Trail #1400 as far as the wilderness boundary. Long range plans anticipate terminating bike use one-half mile south of the wilderness boundary, at the junction with Trail #1404, and continuing motorized access up the latter trail as far as Myrtle Lake.

Segment 3

Segment 3 is 15 miles in length. Access along the river is provided by both Forest and private roads. National Forest Primary Route #51, a double lane paved road, follows the east side of the river to the North Fork Campground, where it is succeeded by a gravel surface road to its terminus at Cottonwood Campground. Secondary Forest roads intersect the corridor one-half mile above Entiat Falls, just below the confluence with the North Fork Entiat River, at Jungle Creek where the Tommy Creek Road #5605 crosses the Entiat River, and approximately one mile above Lake Creek. There are also two road bridges across the Entiat: one at Cottonwood Campground, and the second in connection with the Tommy Creek Road.

The remaining developments in Segment 3 are related to recreation use. There are trailheads at Cottonwood Campground (#1400 and #1429), North Fork Campground (#1434), and at Lake Creek Campground (#1443, #1423 and #1424), where a footbridge spans the Entiat. Developed camping/picnic sites are located at regular intervals along the east side of the corridor, and include Cottonwood Campground, Three Creek Campground (which is proposed for expansion as an ORV campsite, including construction of a bridge across the Entiat River for motorized use), Spruce Grove Campground, North Fork Campground, Silver Falls Campground, Lake Creek Campground and Fox Creek Campground. And finally, there are two recreation residence tracts encompassing a total of 17 recreation residences under permit to the Forest Service: the Riverside tract, approximately 1/4 mile above the Tommy Creek road bridge, and the Pope Creek tract, on both sides of Pope Creek near its confluence with the Entiat River.

Suitability:

Suitability Factor #1 -Characteristics Which Make the Area a Worthy Addition to the System.

Originating in the Glacier Peak Wilderness, this steep, glaciated valley is bordered by extensive snowfields and alpine glaciers, high mountain peaks, and rugged slopes with large outcrops of granite and gneiss. The river plunges in cascading rapids, riffles and falls, to a meandering course in the broader valley of the lower reaches. A mixed conifer forest, interspersed with patches of old growth and natural openings, contributes to the pristine setting of the river.

Suitability Factor #2 -Current Status of Land Ownership and Use.

The river corridor proposed for designation is located exclusively on National Forest lands. Major uses include recreation (fishing, camping, hiking, driving for pleasure, trail bike riding, snowmobiling, and cross-country skiing) and, below Garland Creek, a full range of timber management activities. The upper 15 miles of the river are managed as wilderness.

Suitability Factor #3 -Foreseeable Potential Uses.

There would be a little change in the management of the National Forest lands as a result of designation. Segment 1 is currently managed as wilderness, which emphasizes the primitive, undeveloped character of the environment. This value would not be affected. Until the passage of the Washington State Wilderness Act of 1984, the lands in Segments 2 and 3 were managed according to direction outlined in the Chelan Unit Plan, issued in April 1976. This plan specified that the river corridor above Garland Creek be included as a study area for potential wilderness consideration. Below Garland Creek, the river was to be managed for a full range of commodities and amenities. The Wilderness Act released the area above Garland Creek from required consideration as wilderness, thus potentially opening it to a full range of multiple use activities. Designation as a Wild river in Segment 2 would preclude future timber harvest in the 320 acre area between Garland Creek and Cottonwood Campground. However, in the preferred alternative to the Forest Plan, this same area is proposed for allocation as unroaded, non-motorized southwest of the river, and unroaded, motorized northeast of the river. There would be no scheduled timber harvest in this portion of the corridor. Motorized trail bike use might be appropriate, even with a Wild classification, where current use is taking place and the adjacent allocation of the area is compatible.

With respect to mineral potential, Segment 1 is currently withdrawn from mineral entry because it lies wholly within the Glacier Peak Wilderness. Segments 2 and 3 are not encumbered by any mining claims. Furthermore, the area has not been identified as having potential for the occurrence of locatable mineral resources, nor is it classified as being prospectively valuable for leasable mineral commodities.

Under current management direction, some scenic values in Segment 3 could be foreclosed if the river were not managed as part of the Wild and Scenic Rivers System, unless timber activities follow a visual quality objective of retention. The greatest potential threat to river values, however, would be in future diversions or impoundments. Designation would ensure the protection of the free-flowing character of the Entiat River.

Suitability Factor #4 -Public, State, and Local Governmental Interests.

There has been a great deal of support for designation of the Entiat River as an addition to the Wild and Scenic River System. Many have expressed a desire to protect the pristine condition and integrity of the river, to provide for fisheries habitat and to ensure free-flowing, sustainable flows of water. There is also a segment of the public that hopes to restrict ORV use in the Entiat corridor through designation of the river.

Most of the opposition to designation has come from landowners in the valley, below the proposed Wild and Scenic boundary. Many of these people view designation as a threat to their property rights, and feel that present federal, state and local controls are adequate protection for the river values. They fear that the Wild and Scenic boundaries will eventually be expanded, that condemnation will occur to take private property for public use, that there will be possible restrictions on existing water rights, and that property values will fall. Some worry that there will be a loss in timber-related jobs, and that an increase in public use will be harmful to the resources within the corridor. There are also a great number of people who are concerned that designation of Segment 2 as Wild would effectively eliminate trail bike riding in the upper Entiat Valley.

Chelan County officials have indicated they could not support any proposal for designation of the Entiat River unless the County retains jurisdiction of private lands within the designated corridor (of which there are none in the present proposal). There would be no sharing in the cost of administration of the river, since there are no private holdings within the proposed boundaries. The County has also expressed the same concerns as the private landowners regarding the possible effects of designation on water rights for agricultural lands, and the potential impacts of river designation on downstream private lands. However, the Entiat River below the proposed boundary was determined to be ineligible for inclusion in the National System due to extensive straightening of the channel and other modifications of the waterway. Designation could thus not affect the private lands. In addition, all valid, existing water rights would be unaffected by designation.

The Washington State Department of Wildlife is in full support of the proposed river designation, and in fact, recommends reassessment of additional rivers on the Forest for potential eligibility as Wild and Scenic Rivers. The Yakima Indian Nation, whose ceded lands include the Entiat River drainage, supports designation at the highest potential classification, although they have some concerns for potential conflicts between recreation use and the protection of fisheries and tribal fishing localities. The Yakima would like to be involved in any subsequent river management plans that might be developed.

Suitability Factor #5 -Cost of Acquisition and Interests.

There are no private lands included within the proposed Wild and Scenic corridor of the Entiat River. Consequently, there are no plans to acquire lands or interests in lands here.

Costs associated with designation are related to planning and administration of the river corridor and are directed to National Forest lands. The following are the expected funding needs for the Entiat River for a total five year period:

	Expenses Expected Independent of Designation	Additional Expenses Expected with Designation
General Administration	\$4,000	\$ 16,000
Costs of Implementation		\$ 20,000
Development of Management Plan		\$ 70,000
Development Costs		\$100,000
Operation and Maintenance Costs	\$8,000	\$ 15,000
Total - First Five Years	\$12,000	\$231,000

General administration and operation and maintenance costs are estimated to continue at \$8,600 annually.

Suitability Factor #6-Other Issues and Concerns

Landowners in the Entiat Valley have expressed a major concern with respect to the amount of government regulation that already exists along the Entiat River. There are presently several overlapping National, State and County laws, regulations and executive orders that provide for protection of values within the river system. At the Federal level, these include the National Environmental Policy Act, the National Historic Preservation Act, the Endangered Species Act, the Fish and Wildlife Coordination Act, the Water Resources Planning Act, the Floodplain and Wetlands Executive Orders, the National Forest Management Act of 1976, and the Federal Land Policy and Management Act of 1976, in addition to the Wild and Scenic Rivers Act. At the State level, the Forest Practices Act and the Shorelines Management Act seek similar protection, and in Chelan County, there are further restrictions imposed by the Shoreline Master Program and the local zoning regulations. Several residents feel strongly that the present scope of government regulation is more than adequate to protect the river values. These same landowners also view designation as a threat to their individual rights and freedoms, and even though the eligible river segments do not include private land, they fear loss of their property through governmental acquisition of easements or interests in their lands.

LAKE WENATCHEE RANGER DISTRICT

CHIWAWA RIVER

Classification:

The entire length of the Chiwawa River, from its headwaters near the Cascade Crest to its confluence with the Wenatchee River, is considered to be eligible for inclusion in the Wild and Scenic River System. In the course of determining eligibility, three distinct segments of the river were identified, based on a combination of physical changes in the river character and significant differences in the level of development and land ownership along the river. These segments consist of an upper section (Segment 1) extending from the headwaters in the NE 1/4 of Section 36, T.31N., R.15E., to the Glacier Peak Wilderness boundary in the SE 1/4 of Section 21, T.30N., R.16E.; a middle section (Segment 2) extending from the wilderness boundary to Goose Creek in the SE 1/4 of Section 13, T.27N., R.17E., and a lower section extending from Goose Creek to the confluence with the Wenatchee River in the NE 1/4 of Section 1, T.26N., R.17E.

Based on their highest potential classification, Segment 1 meets the standards for classification as a Wild River, Segment 2 as a Scenic River, and Segment 3 as a Recreational River.

Segment 1

Segment 1, which is located entirely within the Glacier Peak Wilderness, is approximately five miles in length. The only visible developments along this segment are two foot trails and an unobtrusive foot-bridge. Trail #1550 parallels the east edge of the Chiwawa River corridor to within approximately 1 1/2 miles of the headwaters. A second route, Trail #1513, follows the east bank of the Chiwawa for the first 1/2 mile into the Glacier Peak Wilderness. This latter trail crosses the river by bridge in the NE 1/4 of Section 17, T.30N., R.16E., to begin the ascent up Buck Creek.

Segment 2

Segment 2 is twenty-four miles in length. The west bank of approximately the upper six miles of this segment are within the Glacier Peak Wilderness. The remainder of the segment is also National Forest, with the exception of two parcels of private land: an undeveloped area of about 280 acres at Chikamin Flats, in Sections 20, 21, and 28, T.28N., R.17E., and the old mining townsite of Trinity, just south of the wilderness boundary. Chikamin Flats was logged years ago, but today is a naturally-appearing combination of meadowland and forest cover. There is heavy dispersed recreation use in this area during the summer months. Trinity is the product of late nineteenth century mining developments in the upper Chiwawa. Four houses, a powerplant and a large, non-residential structure occupy a short stretch of the corridor here, maintained by a year-around caretaker.

National Forest Primary Route #62 and Secondary Route #6200, which is a gravel-surface extension of Road #62, closely parallel the northeast side of the Chiwawa to within 1 1/4 miles of the wilderness boundary. Intersecting Forest roads take off from the east side of the Chiwawa at Minnow Creek, and at Phelps Creek, near Trinity. The valley road also provides access to trailheads at Chikamin Creek, Finner Creek, Rock Creek and at Trinity, where Trail #1513 provides continuing passage up the Chiwawa into the wilderness. There is one major bridge crossing of the Chiwawa in this segment by Road #62 a short distance above Goose Creek, in the NW 1/4 of Section 13, T.27N., R.17E.

Other developments in Segment 2 include Trail #1548, which extends parallel to Road #62 along the east margin of the river corridor between Deep Creek in Segment 3, and Chikamin Flats to the north. Ten developed sites are situated at intervals along the east side of the Chiwawa between Meadow Creek to the south, and the Trinity townsite to the north. At one of these, Atkinson Flat Campground, approximately 150 to 200 feet of log and rock cribbing has been installed along the shoreline as bank protection. Most of these campgrounds are small and do not detract from the essentially primitive appearance of the river. At Finner Creek, in the SW 1/4 of Section 6, T.28N., R.17E. are the remnants of the historic Rock Creek Guard Station. The Guard Station itself was destroyed by fire in 1977, but the Civilian Conservation Corps-era garage is still standing. And finally, the Chiwawa Summer Home site, a tract of eight, rustic-appearing recreation residences, is located south and west of the river on National Forest land, near the south boundary of Segment 2.

Segment 3

Segment 3 is 6 miles in length. Most of the private land within the Chiwawa corridor is located along this segment, particularly in the lower half where only one small piece is National Forest. Agricultural, residential and recreational developments characterize the private lands here. Most are fairly light density, with the exception of Chiwawa River Pines in the W 1/2 of Section 31, T.26N., R.18E., which is a year-round residential subdivision. A second major development, Thousand Trails in the SE 1/4 of Section 31, T.26N., R.18E., is a popular private recreational camp, with trailer and tent units, clubhouse facilities and a swimming pool.

A network of County, Forest and private roads approach the Chiwawa in this segment. County Road #22 intersects the Chiwawa corridor at the Chiwawa River Pines subdivision, crossing the Chiwawa by way of a double-lane concrete bridge. Forest Roads #6100, east of the Chiwawa, and #6121 west of the Chiwawa, parallel the river from this point north to Goose Creek. An extensive array of private roads are threaded through Shugart Flats, just south of the confluence of the Chiwawa with the Wenatchee River.

There are also two developed campsites on National Forest land in Segment 3: Goose Creek Campground in the SE 1/4 of Section 13, T.27N., R.17E., which is currently being expanded and converted into an ORV campground with cooperative funding from Washington State; and the Deep Creek Campground, a small, rustic site in the SE 1/4 of Section 19, T.27N., R.18E.

There is one sizable water diversion in Segment 3, the Wenatchee-Chiwawa Irrigation Canal which takes off from an intake box on the south side of the Chiwawa River in the NW 1/4 of Section 30, T.27N., R.18E. The canal parallels the west edge of the river corridor for approximately four miles, before diverging to the Wenatchee River corridor. The Wenatchee-Chiwawa Irrigation District has held rights to divert water from the Chiwawa River since 1912. Other small irrigation diversions exist along the lower three miles of Segment 3, but none impede the free-flowing character of the Chiwawa.

Suitability:

Suitability Factor #1 -Characteristics Which Make the Area a Worthy Addition to the System.

The Chiwawa River is typified at its upper end by towering mountain peaks, extensive snowfields and imposing valley walls with numerous rocky areas. The river channel here is narrow and plunges downstream in frequent cascades and small falls, which gradually lessen in intensity as the river enters the broader, U-shaped valley of the mid- and lower segments.

There is heavy recreation use of the Chiwawa in the form of camping, fishing, hunting, hiking, and driving for pleasure by visitors from both east and west of the Cascades. In Segment 2, the

combination of moderate weather, diversity of recreation opportunities and ready access to all reaches of the river make this stretch one of the most popular recreation destinations in the Lake Wenatchee area. The upper drainage serves as the most heavily used access route into the Glacier Peak Wilderness east of the Cascades.

The Chiwawa is also notable for its anadromous fish population. Most other drainages in the upper Columbia River system have runs that are supplemented with hatchery-bred salmon. In contrast, the Chiwawa experiences a sizable, self-sustaining wild run of spring chinook each year, as well as a large run of steelhead.

Suitability Factor #2 -Current Status of Land Ownership and Use.

Only 11% of the Chiwawa drainage is in private ownership. The majority of these holdings are concentrated in the lower half of Segment 3, and consist of fairly light density agricultural, residential and recreational developments. The exception is the Chiwawa River Pines subdivision. Current zoning regulations have established a minimum lot size here of less than 1/2 acre. The remaining private land (including the Thousand Trails recreational development) in Segment 3 is zoned for agricultural uses. The minimum lot size along the river is one acre, with no major residential subdivisions permitted. Shoreline works and structures are permitted if they do not substantially change the character of the environment, and are part of a water-dependent or water-related project that would be rendered impossible without the shoreline modification.

The approximately 280 acres of private land at Chikamin Flats in Segment 2 serves as a heavily-used dispersed recreation site. The current owners have been very tolerant of this use, and it is common to find over 100 people camped here on a summer weekend. The historic mining developments at the townsite of Trinity have served as a public attraction, and add to the value of this segment.

National Forest land below the wilderness boundary has been managed under a visual quality objective of retention, which emphasizes the scenic and recreational values of the corridor. Although timber harvest has taken place, the river area has been maintained in its near natural environment.

Suitability Factor #3 -Foreseeable Potential Uses.

There would be no change in management of the National Forest lands as a result of designation. Segment 1 is currently managed as wilderness, which emphasizes the primitive, undeveloped character of the environment. Segments 2 and 3 are presently managed according to direction outlined in the Chelan Unit Plan, issued in April 1976. The plan identifies the Chiwawa River as a potential wild and scenic river, and specifies that management activities be designed to protect the wild, scenic and recreation qualities of the corridor until such time as a detailed study can be conducted. In addition, protection and/or enhancement of the fisheries habitat will continue to be an important part of management in this area. The Chelan County P.U.D. is in the process of developing plans for a spring Chinook fish rearing station near the mouth of the Chiwawa, that has been determined by the National Park Service to be consistent with the criteria established for the Recreational classification of this portion of the Chiwawa.

Off road vehicle use has been fairly heavy in Segments 2 and 3, particularly in the vicinity of Goose Creek, where the present campground is being expanded to accommodate ORV's. Scenic and Recreational River classifications both provide the latitude to permit, prohibit or restrict motorized travel. It is likely that ORV use will be allowed to continue unless those values for

which the river would be designated are threatened.

With respect to mining interests, the Chiwawa has a long history of mining activity. A mine-to-market road was constructed up the valley, a halfway house was established at Chikamin Flats for miners traveling to the upper drainage, and the townsite of Trinity was developed adjacent to a series of mining claims, twenty-two of which were patented. Today, Segments 1 and 2 are still encumbered by numerous unpatented placer and lode claims, several of which are maintained by annual assessment work. Some of those within Segment 1 predate the wilderness withdrawal, and may have valid existing mining rights. The BLM has classified Segments 1, 2 and 3 as prospectively valuable for geothermal resources, and Segments 2 and 3 as prospectively valuable for coal. A Forest Service materials inventory has also identified at least four rock sources along Segments 2 and 3, which range in volume from 10,000 to 100,000 cubic yards. Designation of the river would not affect the future mining potential in any of these segments. Since Segment 1 is within an existing wilderness, new claims and leases are already prohibited. Preexisting claims with valid mining rights would be allowed to continue, subject to regulation (36 CFR 228). Scenic and Recreational classifications do allow for new mining claims and mineral leases, subject to the same regulation as above, provided the mineral activity be conducted in a manner that minimizes environmental degradation.

The effects of designation on potential future uses of the private land in Segments 2 and 3 are likely to be minimal, due to the level of classification proposed for the river, and because of the present zoning and land use regulations that are in place. The majority of the private land is in Segment 3, where a Recreational classification allows for small communities as well as dispersed or cluster residential developments along the river. New structures are allowed for both habitation and for intensive recreation use. Lands may also be managed for a full range of agricultural uses, to the extent currently practiced. The Residential-Low Density and Plain Rural District Zones that cover Segment 3 appear to adequately protect the values that would be recognized through designation of the river. One constraint that would be introduced through designation would be in the modifications permitted along the river banks and channel. Existing structures (low dams, diversions, riprap and other minor structures) would be allowed, but ordinarily new structures would be prohibited, as would development of hydroelectric facilities. Variances to the existing zoning regulations might also need to be restricted in order to ensure protection of the values for which the river would be designated.

The Shoreline Master Program classifications of the private land in Segment 2 will generally provide adequate protection of the river values here. Additional restrictions might be imposed to require screening of any new structures from the river, to limit concentrations of habitations to relatively short reaches of the corridor, to constrain shoreline modifications, or to prevent any direct or adverse effects on river values.

There are probably few values that would be foreclosed or curtailed if the river were not protected as part of the System, as long as management continues to follow a visual quality objective of retention. As mentioned above, current management recognizes the scenic, recreational and fisheries values within the corridor, and present zoning provides a reasonable level of protection on private land. The greatest potential threat to river values would be in future diversions or impoundments. Designation would ensure the protection of the free-flowing character of the Chiwawa River.

Suitability Factor #4 -Public, State and Local Governmental Interests.

The overall public response to designation of the Chiwawa as an addition to the National Wild and Scenic River System has been positive. Many have expressed support for protection of the outstanding river values here. The major concerns expressed are with management of the private

land in the lower reaches of Segment 3. Some property owners are alarmed at the potential for additional government regulation of their holdings, and seek reassurance as to the future status of the Wenatchee-Chiwawa Irrigation System water rights. Some have proposed that designation of the river begin above the Chiwawa River Pines subdivision, so as to eliminate the most densely populated portion of the Chiwawa from inclusion in the National system.

Chelan County officials have indicated they could not support any proposal for designation of the Chiwawa unless the County retains jurisdiction of private lands within the designated river corridor. The only costs that would be shared in administration of the river would be those independent of designation, that are associated with existing County administration of the private holdings. The Washington State Department of Wildlife is in full support of the proposed river designation, and in fact, recommends reassessment of additional rivers on the Forest for potential eligibility as Wild and Scenic Rivers. The Yakima Indian Nation, whose ceded lands include the Chiwawa River drainage, supports designation at the highest potential classification, although they have some concerns for potential conflicts between recreation use and the protection of fisheries and tribal fishing localities. The Yakima would like to be involved in any subsequent river management plans that might be developed.

If the Chiwawa River is included in the Wild and Scenic River System, the Forest Service would rely on State and County controls for administration of the private lands. Valid existing water rights, such as those held by the Wenatchee-Chiwawa Irrigation District, would not be affected by designation.

Suitability Factor #5 -Cost of Acquisition and Interests.

There are no foreseeable plans to acquire lands or interests in lands along the Chiwawa River. Acquisition of easements from private landowners would occur only if key values were in jeopardy, and local government could not provide the necessary protection.

Costs associated with designation are related to planning and administration of the river corridor, and are primarily directed to National Forest lands. The following are the expected total funding needs for the Chiwawa River for the next five year period:

	Expenses Expected Independent of Designation	Additional Expenses Expected with Designation
General Administration	\$ 3,000	\$ 12,000
Costs of Implementation		\$ 15,000
Development of Management Plan		\$ 65,000
Development Costs	\$50,000	\$100,000
Operation and Maintenance Costs	\$10,000	\$ 15,000
 Total - First Five Years	 \$63,000	 \$207,000

General administration and operation and maintenance costs are estimated to continue at \$8,000 annually.

Suitability Factor #6-Other Issues and Concerns

No other major concerns or issues have been identified.

LITTLE WENATCHEE RIVER

Classification:

The Little Wenatchee River, from the falls just below Riverside Campground in the SW 1/4 of Section 11, T.27N., R.15E., to the outlet at Lake Wenatchee, is considered to be eligible for inclusion in the Wild and Scenic River System. Although the river above this point was included in the initial eligibility study, the lack of outstandingly remarkable features excludes the upper portion of the river from further study. Following the determination of eligibility, this lower section of river was identified as Segment 1, since it is now the only segment of the drainage under consideration for designation. Based on its highest potential classification, this segment meets the standards for classification as a Scenic River.

Segment 1

Segment 1 is eight miles in length. The corridor here is a mix of National Forest and private lands, with approximately one third of the acreage being in private ownership. There are few developments along the segment. The north edge of the corridor is paralleled by Forest Road #6500, which approaches the river in places. The only existing structure is the Two Rivers Sand and Gravel Plant, situated on private land in the SW 1/4 of Section 15, T.27N., R.16E. The plant has an active quarry for the removal of floodplain gravels, but the operation, though visible from the river, does not physically intrude upon the river bank or channel.

Suitability:

Suitability Factor #1 -Characteristics Which Make the Area a Worthy Addition to the System.

The outstanding value in the Little Wenatchee River is the natural, successfully reproducing run of sockeye salmon. This river is part of only two remaining river/lake systems in the Columbia River drainage that still support a wild run of this lake-oriented, anadromous fish.

Suitability Factor #2 -Current Status of Land Ownership and Use.

Approximately 31% of Segment 1 is in private ownership, this being concentrated along the lower reaches of the river, close to Lake Wenatchee. Present Chelan County Shoreline Master program requirements here call for a minimum lot size that varies from 1/4 to one acre through most of the corridor. The regulations governing shoreline modifications range from prohibition except where necessary to protect or preserve the character of the environment, to permitting limited modifications.

The major private use of the corridor is the Two Rivers Sand and Gravel Plant. There has been substantial quarrying of the floodplain, which has had a noticeable impact on the visual setting through this portion of the corridor.

National Forest lands north of the river are presently managed to protect those qualities of the water and adjacent corridor that might qualify the Little Wenatchee for designation as a Wild and Scenic River. South of the river, the corridor is managed for a full range of timber management activities that follow, to the extent possible, a visual quality objective of retention.

There are no mining claims presently located within Segment 1, nor have any prospectively valuable, leasable mineral commodities been identified within this reach of the river.

Suitability Factor #3 -Foreseeable Potential Uses.

A portion of the acreage in the lower mile of private land within the corridor is being subdivided and sold as recreational and second home sites, but because much of this land is flooded during spring runoff, no actual development of the sites has as yet been proposed. In addition, a Scenic classification here would likely be compatible with the development of individual recreation residence lots. This classification allows for new structures as long as these are modest in size, unobtrusive, and do not have a direct and adverse effect on river values. Concentrations of habitations may occur, but are limited to relatively short stretches of the river corridor. However, large scale developments or industrial uses that affect significant river values, would have to be restricted. This might have an effect on current clearcutting practices on private land, as well as on the Two Rivers quarrying operation (particularly any plans for expansion of the facilities). Finally, present county zoning regulations do allow for small scale shoreline modifications in places. Designation might further restrict these, or limit the modifications to those areas where they are necessary to protect or preserve the character of the environment.

There could also be some effect on the management of the National Forest lands along the south side of the river corridor. The north side of the Little Wenatchee River in Segment 1 is currently managed according to direction outlined in the Chelan Unit Plan, issued in April 1976. That document identified the Little Wenatchee River as a potential addition to the Wild and Scenic River System, and specified that management activities be designed to protect existing qualities of the waters and adjacent lands. However, National Forest land south of the river is presently managed under the Alpine Lakes Management Plan as General Forest. This allocation allows for a full range of timber management activities within view of the river, although these are to be shaped and blended to the extent practical with the natural landscape. Designation as a Scenic River would require that this portion of the corridor be managed for a visual quality objective of retention, with timber harvest activities designed to enhance the scenic values of the river.

Some scenic values could be foreclosed if the river is not managed as part of the Wild and Scenic River System. Quarry development on private land will continue to produce impacts to the shoreline area at the lower end of the corridor. Although the intent of designation is to follow existing State and County controls on private land, it is possible that designation would encourage greater sensitivity to the visual values within the Wild and Scenic corridor. In addition, designation would protect the free-flowing character of this eight mile stretch of the Little Wenatchee River.

Suitability Factor #4 -Public, State and Local Governmental Interests.

The overall public response to designation of the Little Wenatchee River as an addition to the Wild and Scenic River System has been positive. Many people expressed a desire to see the entire river designated (although only the lowest segment is eligible) in order to keep the present corridor unmodified. There was serious concern expressed for the protection of the sockeye spawning habitat. Mention was also made of the scenic and recreational aspects of the river, the diversity of habitats, the old growth stands in the upper stretches, and the extent and complexity of riparian communities near Lake Wenatchee. The only negative response from the public was directed to the level of classification, with one individual proposing recreational rather than scenic as the highest potential classification of the Little Wenatchee.

Chelan County officials have indicated they could not support any proposal for designation of the Little Wenatchee River unless the County retains jurisdiction of private lands within the designated river corridor. The only costs that would be shared in administration of the river would be those independent of designation, that are associated with existing County administration of the private holdings.

There were no comments from the State specifically directed to designation of the Little Wenatchee.

Suitability Factor #5 -Cost of Acquisition and Interests.

There are no foreseeable plans to acquire lands or interests in lands along the Little Wenatchee River. Acquisition of easements from private landowners would occur only if key values were in jeopardy, and local government could not provide the necessary protection.

Costs associated with designation are related to planning and administration of the river corridor and are primarily directed to National Forest lands. The following are the expected funding needs for the Little Wenatchee River for a total five year period:

	Expenses Expected Independent of Designation	Additional Expenses Expected with Designation
General Administration	\$300	\$ 3,000
Costs of Implementation		\$ 5,000
Development of Management Plan		\$30,000
Development Costs		
Operation and Maintenance Costs	\$500	\$ 3,000
Total - First Five Years	\$800	\$41,000

General administration and operation and maintenance costs are estimated to continue at \$1,400 annually.

Suitability Factor #6 Other Issues and Concerns

No other major issues or concerns have been identified.

NAPEEQUA RIVER

Private Land 

NAPEEQUA RIVER

Classification:

The entire length of the Napeequa River, from the headwaters near the Cascade Crest to the confluence with the White River, is considered to be eligible for inclusion in the Wild and Scenic River System. In the course of determining eligibility, two distinct segments of the river were identified, based on a combination of physical changes in the river character, and differences in landownership and the level of development along the corridor. These segments consist of an upper section (Segment 1) extending from the headwaters in the SW 1/4 of Section 21, T.30N., R.15E., to the Glacier Peak Wilderness boundary in the NW 1/4 of Section 17, T.28N., R.16E., and including the Twin Lakes Creek tributary; and a lower section (Segment 2) extending from the wilderness boundary to the confluence with the White River.

Based on their highest potential classification, Segment 1 meets the standards for classification as a Wild River, and Segment 2 as a Recreational River.

Segment 1

Segment 1, which includes the one mile stretch of Twin Lakes Creek, is approximately 15 miles in length. Trail #1518, which drops into the Napeequa via Little Giant Pass, parallels the river for a distance of four miles. Trail #1562 crosses the Napeequa in the NW 1/4 of Section 36, T.30N., R.15E., as it begins the ascent to Boulder Pass. The Twin Lakes Trail parallels Twin Lakes Creek in this segment, its full length to Twin Lakes.

The Washington State Department of Wildlife also uses Twin Lakes as a cutthroat trout rearing station. Improvements include a rustic cabin and associated structures, boat dock, board walks, and fish traps and holding pens under the surface of the lake. This long established use (eggs have been taken since 1916 and the present cabin was constructed about 1949) was recognized during legislative discussions leading to expansion of the Glacier Peak Wilderness in 1984. Although the area was added to the wilderness, this use, including operation of a motorboat, was allowed to continue. Use is periodic and, with the exception of the specific site, does not detract from the primitive setting here.

Segment 2

Segment 2 is one mile in length and flows almost exclusively through private land. There has been substantial development of the private land, including the Tall Timber Ranch, a Presbyterian Church facility which is used as a youth camp and for conferences, retreats, and similar functions; and the Tall Timber Home Owners Association subdivision. This latter development, which is located south of the river in the SE 1/4 of Section 18, T.28N., R.16E., consists of 53 lots, approximately half of which have been developed as summer homes and trailer sites.

The only Forest Service improvement in this segment is the Twin Lakes trailhead, which is adjacent to the confluence of the Napeequa with the White River. The trail approaches the southeast bank of the Napeequa near the section line between Sections 18 and 17, T.28N., R.17E., paralleling it from this point into the wilderness.

The White River Road #6400, which follows the east bank of the White River, crosses the Napeequa near its confluence by way of a concrete bridge. There are also several short, private road segments accessing the Tall Timber Ranch, and the above mentioned recreation residence lots.

Riprap has been installed near the confluence of the Napeequa with the White River as well as in the vicinity of the Tall Timber Homeowners Association recreation residence subdivision, to protect the developments here. There are no other shoreline modifications in this segment.

Suitability:

Suitability Factor #1 -Characteristics Which Make the Area a Worthy Addition to the System.

The scenic and geologic features of the Napeequa corridor are outstandingly remarkable. The river flows through a narrow, glaciated valley characterized by towering mountain peaks, impressive alpine glaciers, extensive snowfields, extremely steep slopes, rugged granitic outcrops, and a vegetative cover marked by scattered old growth, hardwoods, and interspersed meadow openings. The watercourse tumbles through this valley in a series of waterfalls, cascades and slow meanders.

Suitability Factor #2 -Current Status of Land Ownership and Use.

All of Segment 1 is National Forest and is currently managed as wilderness.

About 98 per cent of the land in the one mile stretch of Segment 2 is privately owned. This includes the Tall Timber Ranch and the Tall Timber Home Owners Association subdivision. Under the Chelan County Shoreline Master Program, the area is designated as Natural Environment, the most restrictive of the four shoreline classifications. The minimum lot size is one acre; residences are confined to single family units which must blend, to the extent possible, with their surroundings; minimum river frontage is 200 feet; and shoreline modifications such as diversions, retaining walls and riprap are prohibited except where necessary to protect or preserve the character of the environment.

Suitability Factor #3 -Foreseeable Potential Uses.

There would be no change in management of the National Forest lands as a result of designation. Segment 1 is currently managed as wilderness, which emphasizes the primitive, undeveloped character of the environment. With respect to the fish rearing facility at Twin Lakes, designation of the Twin Lakes Creek tributary of the Napeequa as Wild would be no more restrictive than the current wilderness designation. In fact, Wild River standards allow for structures and activities associated with fisheries enhancement projects, as long as these do not impact the values for which the river is being designated. Only two percent of the corridor in Segment 2 is National Forest. A portion of this area is occupied by the Twin Lakes Trail, which was relocated in 1978 to bypass private property along the river.

Because Segment 1 of the Napeequa River lies wholly within the Glacier Peak Wilderness, it is withdrawn from mineral entry. Segment 2 is not encumbered by any mining claims. Furthermore, the area has not been identified as having potential for the occurrence of locatable mineral resources, nor is it classified as being prospectively valuable for leasable mineral commodities.

The effects of designation on potential future uses of the private land in Segment 2 are likely to be minimal, due both to the level of classification proposed for this stretch of the river, and because of the present zoning and land use regulations that are in place. A Recreational classification allows for dispersed or cluster residential developments (including subdivisions) along the river. New structures are allowed for both habitation and for intensive recreation use. Lands may also be

managed for a full range of agricultural uses, to the extent currently practiced. The Natural Environment designation that covers Segment 2 through the County Shoreline Master Program, appears to adequately protect the values that would be recognized through Wild and Scenic designation of the Napeequa. However, variances to the existing county zoning regulations might need to be restricted in order to ensure protection of these values. Every effort would be made to retain the existing patterns of land use and ownership, provided the uses remain consistent with the purposes of the act. Acquisition of easements from private landowners would occur only if key values were in jeopardy, and local government could not provide the necessary protection.

There are probably few values that would be foreclosed or curtailed if the river were not protected as part of the System. As mentioned above, all but one mile of the river is within wilderness, and present zoning provides protection on private land. The greatest potential threat to river values would be in future diversions or impoundments of the river. Designation would ensure the protection of the free-flowing character of the Napeequa River.

Suitability Factor #4 -Public, State and Local Governmental Interests.

The overall public response to designation of the Napeequa River as an addition to the Wild and Scenic River System has been positive, especially with respect to that portion above the wilderness boundary. Many have expressed support for the recognition and protection of the outstanding river values here, particularly the unique geological characteristics and the pristine beauty of the setting. The major concerns expressed are with designation of Segment 2, because of the extent of private land here. Many of the landowners feel that designation would only increase the governmental restrictions on their property and curtail future development, that present county zoning regulations are adequate to protect the river values, and that designation would create potential security problems as a result of increased public use and access in the area.

Chelan County officials have indicated they could not support any proposal for designation of the Napeequa River unless the County retains jurisdiction of private lands within the designated river corridor. The only costs that would be shared in administration of the river would be those independent of designation, that are associated with existing County administration of the private holdings. The County has also expressed a verbal concern regarding the possible need for riprap to protect improvements.

The Washington State Department of Wildlife is in full support of the proposed river designation, and in fact, recommends reassessment of additional rivers on the Forest for potential eligibility as Wild and Scenic Rivers. The Yakima Indian Nation, whose ceded lands include the Napeequa River drainage, supports designation at the highest potential classification, although they have some concerns for potential conflicts between recreation use and the protection of fisheries and tribal fishing localities. The Yakima would like to be involved in any subsequent river management plans that might be developed.

If the Napeequa River is included in the Wild and Scenic River System, the Forest Service would rely on State and County controls for administration of the private lands. The Forest Service would also recommend that a proviso be included in any Wild and Scenic legislation to allow riprapping for the preservation and protection of existing improvements.

Suitability Factor #5 -Cost of Acquisition and Interests.

There are no foreseeable plans to acquire lands or interests in lands along the Napeequa River. Acquisition of easements from private landowners would occur only if key values were in jeopardy, and local government could not provide the necessary protection.

Costs associated with designation are related to planning and administration of the river corridor and are primarily directed to National Forest lands. The following are the expected funding needs for the Napeequa River for a total five year period:

	Expenses Expected Independent of Designation	Additional Expenses Expected with Designation
General Administration	\$1,000	\$ 1,000
Costs of Implementation		\$ 5,000
Development of Management Plan		\$30,000
Development Costs		\$ 5,000
Operation and Maintenance Costs	\$2,500	\$10,000
Total - First Five Years	\$3,500	\$51,000

General administration and operation and maintenance costs are estimated to continue at \$2,900 annually.

Suitability Factor #6-Other issues and concerns

No other major issues or concerns have been identified.

WENATCHEE RIVER

WENATCHEE RIVER

Classification:

The upper thirty miles of the Wenatchee River, from its source at Lake Wenatchee to the mouth of Icicle Creek near the town of Leavenworth, was determined to be eligible for inclusion in the Wild and Scenic River System. However, the Forest Service confined its study to the corridor between Lake Wenatchee and the Forest boundary, a total distance of twenty-eight miles.

In the course of determining eligibility, two distinct segments of the river were identified, based on a combination of the physical changes in the river character and differences in land ownership and level of development. These segments consist of an upper section (Segment 1) extending from the outlet of Lake Wenatchee in the SW 1/4 of Section 28, T.27N., R.17E., to Tumwater Campground in the SW 1/4 of Section 9, T.25N., R.17E., and a lower section (Segment 2) extending from the campground to the Forest boundary in the SW 1/4 of Section 11, T.24N., R.17E. Both segments meet the standards for classification as a Recreational River.

Segment 1

Segment 1 is approximately 21 miles in length, with the river flowing through private or state land for about 13 of these miles. The non-Federal holdings include the Lake Wenatchee State Park, three private subdivisions (Chiwawa River Pines, Alpine Acres and Ponderosa Estates), the small community of Plain, several residences and cabins not associated with the subdivisions or town of Plain, two county gravel pits (at Plain and at Shugart Flats), and scattered agricultural and timber land. Tumwater Campground is the only developed Forest Service recreation site currently existing in this segment of the river, although there are proposals for two additional Forest Service campgrounds closer to Lake Wenatchee. There are also a number of dispersed camping sites along the river on National Forest land in Segment 1.

Transportation routes providing access to the Wenatchee River in this segment include State Highway 209, which provides intermittent access to the river between its outlet at Lake Wenatchee and its intersection with the highway near the community of Plain; State Highway 207, which crosses the river near the outlet of Lake Wenatchee; the Wenatchee River Road, which closely parallels the north side of the river between the community of Plain and Tumwater Campground; and the Camp 12 Road, which traverses the corridor east of the river from Plain southward a distance of four miles. There are also numerous short road segments within the corridor between Lake Wenatchee and Tumwater Canyon, which serve as private access routes and driveways.

In addition, there are four major bridges crossing the river in connection with the highways: the U.S. Highway 2 bridge at Tumwater Canyon, the State Highway 207 bridge at Lake Wenatchee, the State Highway 209 bridge at Plain, and the Wenatchee River Road bridge, also at Plain.

Burlington Northern Railroad, which crosses the river in the SE 1/4 of Section 25, T.26N., R.17E., extends parallel to the northern boundary of the corridor for approximately two miles. Except for the bridge, the line is not visible from the river. The Wenatchee-Chiwawa Irrigation Canal, which originates in the Chiwawa drainage, parallels Segment 1 for approximately 1 1/2 miles before crossing to the west bank of the river via the old Wenatchee River road bridge at Plain. And finally, a BPA overhead power-line spans the river in the NW 1/4 of Section 24, T.26N., R.17E.

Segment 2

Segment 2, the Tumwater Canyon stretch, is 7 miles in length. Approximately two of these miles are in private ownership, most of this currently held by Longview Fibre. The remainder of the private land includes a few residences along the shoreline, and a candy/gift shop situated midway through the canyon on Lake Jolanda.

U.S. Highway 2, a major cross-state route, parallels and is in view of the river throughout this segment. Recreation developments include the Swiftwater Picnic Area and a few dispersed, camping sites. There is also a Forest Service summer home tract, with seven recreation residences, situated west and above the river.

There is one existing impoundment in Segment 2, the Tumwater Dam, a sixteen foot high concrete structure in the SE 1/4 of Section 33, T.25N., R.17E. With the exception of the dam itself, there are no longer any water diversion facilities at the site. The river is essentially unimpeded today (it spills freely over the dam), and a fish ladder was recently reconstructed to allow more efficient passage of salmon and steelhead. Also associated with the dam is the old penstock grade, which once extended from the dam to the former powerhouse site in the SW 1/4 of Section 33, T.25N., R.17E. The penstock was removed years ago, but the grade is still visible along the west edge of the river for a distance of approximately two miles. Today, the grade is occupied by a Chelan P.U.D. overhead powerline. In Section 10, the penstock bridge, which originally transported the penstock across the river to the power house site on the east bank, is still standing. This bridge is on the National Register of Historic Places as a result of its association with early Great Northern Railroad history.

About one half mile above the mouth of Tumwater Canyon, on the south side of the river, is an old concrete diversion box and remnants of a canal. These facilities were built by the Leavenworth Fish Hatchery, but are no longer in use.

Suitability:

Suitability Factor #1 -Characteristics Which Make the Area a Worthy Addition to the System.

The Wenatchee River drainage ranges from gently rolling, forested terrain interspersed with open meadows in the vicinity of Lake Wenatchee, to spectacular cliffs, enormous boulders, craggy outcrops and cascading rapids through Tumwater Canyon. White water conditions in late spring attract boating, kayaking and rafting use above the canyon, easy highway access provides outstanding scenery viewing, and there is heavy developed and dispersed recreation use throughout the summer months. The corridor falls within the traditional fishing grounds of the Wenatchi Indians, and today still experiences substantial runs of steelhead, sockeye salmon, and spring and fall chinook salmon. This portion of the river system also contains numerous archaeological sites, including the only known petroglyph site on the Forest. Finally, Tumwater Canyon is one of only two locations known where a small population of the Hackelia venusta plant occurs.

Suitability Factor #2 -Current Status of Land Ownership and Use.

Ownership throughout Segment 1 is quite complex, alternating between State and National Forest lands, private subdivisions, and individual private residences, farmlands, and timberland. Approximately 68% of the corridor in this segment is non-Federal, or a mix of National Forest and non-Federal land. Because of these ownership patterns, the river here is characterized by stretches of undeveloped meadowland, interspersed with a forest cover of mixed conifers, some agricultural hay fields, and heavily developed clusters of residences and cabin sites. There may be some further development of what is currently agricultural land near the community of Plain in the near future.

The majority of residents and property owners along Segment 1 wish to preserve the residential and agricultural image of the area. They favor limited growth and development, and recognize that the natural scenic beauty, open space outdoor recreation and water resources are the most valuable assets of the area. With this in mind, the Upper Wenatchee Valley Comprehensive Plan was completed by a Citizens Advisory Committee appointed by the Chelan County Commissioners, in 1988. This plan recommended a Plain Rural District zoning designation for most of the private land here, which specifies low density residential and agricultural uses. A maximum density of one unit per two acres is permitted, except in those shoreline areas where a density of one unit per acre is considered appropriate. Minimum frontage along the river is 200 feet. The plan also provides for open, undeveloped land in areas of significant scenic beauty. Shoreline works and structures are permitted if they do not substantially change the character of the environment and are part of a water-dependent or water-related project.

About 25% of Segment 2 is in private ownership, most of this belonging to Longview Fibre. However, a land exchange is underway that will eventually transfer ownership of the Longview Fibre holdings within the corridor to the Forest Service. A small candy/gift shop is located about midway through the canyon, and a few private recreational residences are situated in this stretch.

Suitability Factor #3 -Foreseeable Potential Uses.

There would be no change in management of the National Forest lands as a result of designation. Segment 1 is currently managed according to direction outlined in the Chelan Unit Plan, issued in April 1976. The plan specifies that management activities be constrained to protect the wild, scenic and recreation qualities of the waterway and an undefined strip of adjacent land. Segment 2 is presently managed under the Alpine Lakes Management Plan as a Special Scenic Area. Under this direction, any commercial forest land outside the existing highway corridor is placed in the unregulated timber component, with timber harvest permitted only where it will enhance or protect the special values here. In addition, a special botanical area was first established in Tumwater Canyon in 1938 to protect the special Lewisia tweedyi species which grows there. This area was formally designated as a Special Botanical Area under the Alpine Lakes Management Plan.

Several recreation developments are under consideration, that could be developed independent of designation. These include two developed campgrounds, three boat put-in/take-out areas, two interpretive sites, and an interpreted riverside trail. The developments would likely be enhanced by designation of the river.

According to BLM mining claim recordation data, Segment 1 has had at least eleven mining claims located along the river in the past. However, due to the lack of annual assessment work, it appears that all eleven have been abandoned. The BLM has also classified the area as being prospectively valuable for coal resources, but there are no coal leases or lease applications at this time, nor has there been any significant exploration or development activity with respect to leasable mineral commodities. In addition, a Recreational classification of the river would allow new mining claims and leases, subject to 36 CFR 228 and other regulations that the Secretaries of Agriculture and Interior may prescribe to protect values of rivers included in the National Wild and Scenic River System.

The effects of designation on potential future uses of the private land in Segments 1 and 2 are likely to be minimal, due both to the level of classification proposed for the river, and because of the present zoning and land use regulations that are in place. A Recreational classification allows for small communities as well as dispersed or cluster residential developments along the river. New structures are allowed for both habitation and for intensive recreation use. Lands

may also be managed for a full range of agricultural uses, to the extent currently practiced. The Plain Rural District and the Residential-Recreational District Zones that cover Segment 1 appear to adequately protect the values that would be recognized through designation of the river. The one constraint that would be introduced through designation would be in the modifications permitted along the river banks and channel. Existing structures (low dams, diversions, riprap and other minor structures) would be allowed, but new structures might be prohibited, as would development of hydroelectric power facilities. Variances to the existing zoning regulations might also need to be restricted in order to ensure protection of the values for which the river would be designated. Every effort would be made to retain the existing patterns of land use and ownership, provided the uses remain consistent with the purposes of the act. Acquisition of easements from private landowners would occur only if key values were in jeopardy, and local government could not provide the necessary protection.

Designation as a Recreational River would likely enhance an already thriving tourism trade in this area. As a consequence of an economic revitalization effort in the 1960's and early 1970's, tourism has become a major focus and source of income for the valley. Thousands of visitors come to Leavenworth each year, many of them to take advantage of the recreation opportunities along the Wenatchee River and its tributary systems. Including the river in the National System might provide an additional attraction for these visitors.

There are probably few values that would be foreclosed or curtailed if the river were not protected as part of the System. As mentioned above, current management recognizes the scenic and recreational values within the corridor, and present zoning provides protection on private land. The greatest potential threat to river values would be in future diversions of the river, or in reactivation and enlargement of the Tumwater dam to provide hydroelectric power. Designation would ensure the protection of the free-flowing character of the Wenatchee River.

Suitability Factor #4 -Public, State and Local Governmental Interests.

The overall response of the public to designation of the Wenatchee River has been positive. There has been particular mention of the excellent kayaking, rafting and canoeing opportunities on the river, and the wish to see these opportunities protected. Most of the concerns expressed have come from landowners in the upper valley, who oppose including the block of private lands along the river within the National System. These residents feel that the river corridor between the headwaters and the upper end of the Wenatchee River Road is best managed under existing County regulations. Some are also concerned about the potential impacts of increased public use on the resources and private property along the river.

Chelan County officials have indicated that they could not support any proposal for designation of the Wenatchee River unless the County retains jurisdiction of the private lands within the designated river corridor. They have also verbally expressed a concern regarding the possible need to use riprap for protection of improvements along the river bank. The Forest Service will recommend that a proviso to allow riprapping be included in legislation for Recreational river segments. The only costs that would be shared in administration of the river would be those independent of designation, that are associated with existing County administration of the private holdings.

The Washington State Department of Wildlife is in full support of the proposed river designation, and in fact, recommends reassessment of additional rivers on the Forest for potential eligibility as Wild and Scenic Rivers. The Yakima Indian Nation, whose ceded lands include the Wenatchee River drainage, supports designation at the highest potential classification, although they have some concerns for potential conflicts between recreation use and the protection of

fisheries and tribal fishing localities. The Yakima would like to be involved in any subsequent river management plans that might be developed.

If the Wenatchee River is included in the Wild and Scenic River System, the Forest Service would rely on State and County controls for administration of the private lands. Valid, existing water rights would not be affected by designation.

Suitability Factor #5 -Cost of Acquisition and Interests.

There are no plans to acquire lands or interests in lands along the Wenatchee River, with the exception of a short 200 foot right-of-way across private land, at the southwest corner of the Highway 209 bridge at Plain. The purpose of the right-of-way is to access a small, isolated piece of National Forest land, where parking and a boat put-in/take-out locality is proposed for development. Cost of acquisition (which includes appraisal and contract administration costs) is estimated to be approximately \$5700.

Other costs associated with designation are related to planning and administration of the river corridor. The following are the expected total funding needs for the Wenatchee River for the next five year period:

	Expenses Expected Independent of Designation	Additional Expenses Expected with Designation
General Administration	\$10,000	\$ 12,000
Costs of Implementation		\$ 65,000
Development of Management Plan		\$130,000
Development Costs		\$156,500
Operation and Maintenance Costs	\$15,000	\$ 35,000
 Total - First Five Years	 \$25,000	 \$398,500

General administration and operation and maintenance costs are estimated to continue at \$14,400 annually.

Suitability Factor #6-Other Issues and Concerns

A major concern has been expressed by the public with respect to the amount of government regulation that already exists in the Wenatchee River corridor. There are presently several overlapping National, State and County laws, regulations and executive orders that provide for protection of values within the river system. At the Federal level, these include the National Environmental Policy Act, the National Historic Preservation Act, the Endangered Species Act, the Fish and Wildlife Coordination Act, the Water Resources Planning Act, the Floodplain and Wetlands Executive Orders, the National Forest Management Act of 1976, and the Federal Land Policy and Management Act of 1976, in addition to the Wild and Scenic Rivers Act. At the State level, the Forest Practices Act and the Shorelines Management Act seek similar protection, and in Chelan County, there are further restrictions imposed by the Shoreline Master Program and the local zoning regulations. Many residents of the Wenatchee Valley feel strongly that the present scope of government regulation is more than adequate, and that designation of the river is not only unnecessary, but would foreclose on future opportunities to consider other resource uses and benefits. Landowners in the upper valley also view designation as a threat to private ownership, fearing loss of their property through governmental acquisition of easements or condemnation.

WHITE RIVER

Private Land 

WHITE RIVER

Classification

The entire length of the White River, from the headwaters near the Cascade Crest to the terminus at Lake Wenatchee, is considered to be eligible for inclusion in the Wild and Scenic River System. In the course of determining eligibility, three distinct segments of the river were identified, based on a combination of physical changes in the river character and differences in landownership along the river. These segments consist of an upper section (Segment 1) extending from the headwaters in the SW 1/4 of Section 5, T.29N., R.14E., to the Glacier Peak Wilderness boundary in the SW 1/4 of Section 35, T.29N., R.15E.; a middle section (Segment 2) extending from the wilderness boundary to a point approximately 1/2 mile above the Tall Timber Ranch, at the east section line of Section 13, T.28N., R.15E.; and a lower section (Segment 3) extending from approximately 1/2 mile above Tall Timber Ranch to Lake Wenatchee.

Based on their highest potential classification, Segment 1 meets the standards for classification as a Wild River, and Segments 2 and 3 as a Scenic River.

Segment 1

Segment 1, which is located entirely within the Glacier Peak Wilderness, is approximately 15 miles in length. Access along the corridor here is provided by Trail #1507, which parallels the river nearly its entire length through this segment. The trail drops into the valley near the headwaters and extends downriver along the north and east banks to the Glacier Peak Wilderness boundary. Trail #1562, which connects the White River drainage with the Napeequa via Boulder Pass, intersects Trail #1507 in the SW 1/4 of Section 15, T.29N., R.16E.

The Indian Creek Trail #1502 follows the west bank of the White River southward from the Indian Creek bridge in the NW 1/4 of Section 27, T.29N., R.16E., to the wilderness boundary, a distance of approximately 1 1/2 miles.

The only other structures to be seen in this segment of the river are a couple of footbridges and the collapsed remnants of the historic Indian Creek Guard Station near the confluence of Indian Creek with the White River.

Segment 2

Segment 2 is seven miles in length and flows exclusively through National Forest land. The White River Road #6400 follows the east bank of Segment 2 to within approximately 1/4 mile of the wilderness boundary, providing scenic views of the creek and access to campgrounds and trailheads. Access continues from the end of the road into the wilderness by way of Trail #1507.

The Indian Creek Trail #1502 takes off from the same point as Trail #1507 and crosses the White River by way of a rustic footbridge near the trailhead. The route follows the west bank of the White River into the Glacier Peak Wilderness. Another segment of this trail heads south along the west bank of the White River for a distance of two miles, providing access to the Mt. David Trail #1521, and the Panther Creek Trail #1522.

Recreation developments within this segment include the White River Falls and Grasshopper Meadows Campgrounds.

Segment 3

Segment 3 is 12 miles in length. The corridor here is a mix of National Forest and private lands, with approximately 64% of the acreage in private ownership. Much of the private land in this segment was homesteaded in the late nineteenth century and many of the fields then cleared along the river are still in use for grazing and hay production. Because of their low level of development, they tend to appear as natural meadow openings to the average river visitor.

Several homes and outbuildings are also situated along Segment 3, though most are not readily noticeable from the river. Tall Timber Ranch and the Tall Timber Homeowners Association subdivision, which are described in the Napeequa River section, overlap with the White River corridor. These are the most heavily developed lands in the segment. In addition, there has been an aggressively marketed subdivision of 20 acre lots along the stretch of river between Lake Wenatchee and Sears Creek. The Twin Lakes Trailhead and the Napeequa Crossing Campground are the only Forest Service recreation developments in this segment.

The County road, which eventually becomes Forest Road #6400 above the confluence of the Napeequa with the White River, intermittently approaches the river throughout Segment 3. Other Forest roads intersect the White River Road just above Lake Wenatchee (the Little Wenatchee Road #6500) and near Sears Creek, and a private road system diverges from the main road at Tall Timber Ranch, near the mouth of the Napeequa. In addition, there are two bridge crossings of the river in connection with the road system: the Little Wenatchee Road bridge which spans the White River a couple miles above its outlet, and the Sears Creek Road bridge in the NE 1/4 of Section 5, T.27N., R.16E.

There is also a gaging station site in this segment, situated 200 feet downstream of the Sears Creek bridge. The station has been periodically in use since 1912.

Suitability:

Suitability Factor #1 -Characteristics Which Make the Area a Worthy Addition to the System.

The White River is noted for its varied and outstanding scenery. Originating high in the Glacier Peak Wilderness, the river takes its name from the glacial silt that gives it a distinct milky appearance. At its upper end, the river plunges through a steep walled, glaciated valley that is bordered by stark mountain peaks, impressive alpine glaciers, precipitous cliffs, and numerous bare rock slopes, into the broader, more gently rolling terrain near Lake Wenatchee. The river course is one of cascading riffles and white water rapids, meanders, oxbows and wetlands. Patches of old growth interspersed with lush, green meadows add to the pristine ambience of the corridor.

A second attribute of outstanding value is the fact that the White River is one of only two remaining lake/river systems in the Columbia River drainage that still support a natural run of the anadromous sockeye salmon.

Suitability Factor #2 -Current Status of Land Ownership and Use.

Twenty-two percent of the White River corridor is in private ownership, all of these holdings being located in Segment 3. With the exception of that portion of the Tall Timber Homeowners Association subdivision that overlaps with the corridor in Segment 3, these residential and recreational uses are light density. Under the Chelan County Shoreline Master Program, the area is designated as Natural Environment, the most restrictive of the four shoreline classifications. The minimum

lot size is one acre, residences are confined to single family units which must blend, to the extent possible, with their surroundings, and shoreline modifications are prohibited except where necessary to protect the character of the environment. Besides these regulations, the soil and other physical characteristics of the land here substantially limit the scale of development that might otherwise be anticipated.

National Forest land below the wilderness boundary has been managed under a visual quality objective of retention, which emphasizes the scenic and recreational values of the corridor. Although timber harvest has taken place, the river area has been maintained in a near natural condition. There is a small amount of livestock grazing (30 to 40 head of cattle, and breeding stock) associated with the private holdings.

Suitability Factor #3 -Foreseeable Potential Uses.

There would be no change in management of the National Forest lands as a result of designation. Segment 1 is currently managed as wilderness, which emphasizes the primitive, undeveloped character of the environment. Segments 2 and 3 are presently managed according to direction outlined in the Chelan Unit Plan, issued in April 1976. The plan identifies the White River as a potential wild and scenic river, and specifies that management activities be designed to protect the wild, scenic and recreation qualities of the corridor until such time as a detailed study can be conducted.

The mineral and energy resource potential of the White River is marginal. A small portion of Segment 2 once had mining claims located within the corridor, but there is no mention of these in the current BLM mining claim records. Currently, there are no reported locatable mineral resource occurrences along the river, nor does there appear to be much likelihood of future exploration or development. The river has been classified by the BLM as being prospectively valuable as a source of geothermal energy, the only leasable mineral resource with any potential for exploration in the White River drainage. However, designation of the river would not affect future mining or mineral lease potential. Since Segment 1 is within an existing wilderness, new claims and leases are already prohibited. Scenic classification does allow for new mining claims and mineral leases, subject to regulation (36 CFR 228), and provided the mineral activity be conducted in a manner that minimizes environmental degradation.

The White River provides vital sockeye salmon spawning habitat. One potential limitation that could occur on National Forest land as a result of Scenic designation might be in the type of structures or improvements that could be constructed to enhance this habitat.

The effects of designation on potential future uses of the private land in Segment 3 are likely to be minimal, due to the present County land use regulations that are in place. Scenic designation allows for new structures, as long as these are modest in size, unobtrusive, and do not have a direct and adverse effect on river values. Concentrations of habitations may occur, but are limited to relatively short reaches of the river corridor. Agricultural use is permitted to the extent currently practiced. Shoreline Master Program classification of the private land as a Natural Environment, the most restrictive of the four classifications, incorporates these objectives and would appear to adequately protect the values that would be recognized through designation of the river. However, variances to these regulations might need to be restricted in order to ensure protection of the river values.

There are probably few values that would be foreclosed or curtailed if the river were not protected as part of the System, as long as management continues to follow a visual quality objective of retention. As mentioned above, current management recognizes the scenic and recreational values within the corridor, and present county land use regulations provide a reasonable level of protection on private land. The greatest potential threat to river values would be in future impoundments. Designation would ensure the protection of the free-flowing character of the White River.

Suitability Factor #4 - Public, State and Local Governmental Interests.

The overall public response to designation of the White River as an addition to the Wild and Scenic River System has been positive. Many have expressed support for protection of the outstanding river values here, particularly the white water opportunities, the fisheries and the scenery. The major concerns expressed are with management of the private land in Segment 3, especially in the area around Tall Timber Ranch. The Ranch owners and administrators are fearful of the effect on future development that a Scenic designation might have, as well as of the disruptive influence and potential security problems that might result from increased public use and access in the area. A few property owners are alarmed at the potential for additional government regulation of their holdings if the river were to be designated.

Chelan County officials have indicated they could not support any proposal for designation of the White River unless the County retains jurisdiction of private lands within the designated river corridor. The only costs that would be shared in administration of the river would be those independent of designation, that are associated with existing County administration of the private holdings. The County has also expressed a verbal concern regarding the possible need to riprap to protect improvements.

The Washington State Department of Wildlife is in full support of the proposed river designation, and in fact, recommends reassessment of additional rivers on the Forest for potential eligibility as Wild and Scenic Rivers. The Yakima Indian Nation, whose ceded lands include the White River drainage, supports designation at the highest potential classification, although they have some concerns for potential conflicts between recreation use and the protection of fisheries and tribal fishing localities. The Yakima would like to be involved in any subsequent river management plans that might be developed.

If the White River is included in the Wild and Scenic River System, the Forest Service would rely on State and County controls for administration of the private lands. The Forest would also recommend that a proviso be included in any Wild and Scenic legislation to allow riprapping for the preservation and protection of existing improvements.

Suitability Factor #5 -Cost of Acquisition and Interests.

There are no foreseeable plans to acquire lands or interests in lands along the White River. Acquisition of easements from private landowners would occur only if key values were in jeopardy, and local government could not provide the necessary protection.

Costs associated with designation are related to planning and administration of the river corridor and are primarily directed to National Forest lands. The following are the expected funding needs for the White River for a total five year period:

	Expenses Expected Independent of Designation	Additional Expenses Expected with Designation
General Administration	\$ 2,500	\$ 5,000
Costs of Implementation		\$12,000
Development of Management Plan		\$65,000
Development Costs	\$30,000	\$60,000
Operation and Maintenance Costs	\$ 8,000	\$26,000
Total - First Five Years	\$40,500	\$168,000

General administration and operation and maintenance costs are estimated to continue at \$8,300 annually.

Suitability Factor #6-Other Issues and Concerns

No other major issues or concerns have been identified.

ICICLE CREEK

Private Land 

LEAVENWORTH RANGER DISTRICT

ICICLE CREEK

Classification:

The Icicle Creek, from the headwaters to the Wenatchee National Forest boundary in the NE 1/4 of Section 26, T.24N., R.17E., is considered to be eligible for inclusion in the Wild and Scenic River System. In the course of determining eligibility, three distinct segments of the river were identified, based on a combination of physical changes in the river character, and differences in landownership and development along the river corridor. These segments consist of an upper section (Segment 1) extending from the headwaters at Josephine Lake to the Alpine Lakes Wilderness boundary in the NE 1/4 of Section 3, T.24N., R.15E.; a middle section (Segment 2) extending from the wilderness boundary to the City of Leavenworth water intake in the SE 1/4 of Section 28, T.24N., R.17E.; and a lower section (Segment 3) extending from the water intake to the Forest boundary.

Based on their highest potential classification, Segment 1 meets the standards for classification as a Wild River, Segment 2 as a Scenic River, and Segment 3 as a Recreational River.

Segment 1

Segment 1, which is located entirely within the Alpine Lakes Wilderness, is approximately 12 miles in length. Trail #1551 parallels and criss-crosses the Icicle in this segment, and is intersected at various points by trails associated with the side drainages. Numerous undeveloped sites provide camping opportunities along this portion of the corridor.

Segment 2

Segment 2 is 14 miles in length. Approximately 46% of the corridor is in private ownership, the lands being intermingled in checkerboard pattern with National Forest System lands. Most of these private holdings have been surveyed and are being sold for individual cabin development. Five of the lots currently have structures on them, but the buildings are screened by vegetation and/or topography from the creek. The Church of Moses Lake has also applied for a conditional use permit to build a small RV Park on their property in Section 13, T.24N., R.16E. As with all developments in the Icicle corridor, their proposal will be closely scrutinized by the Icicle Valley Design Review Overlay District, to ensure it meets the required land use standards established by the District for private land.

Access along the Icicle in this segment is provided by the Icicle River Road #7600, which follows the north bank of the creek to the upper end of the segment. In addition, three tributary roads intersect the corridor at Doctor Creek, Bridge Creek and Eightmile Creek. Branches of the Icicle Road are reached by a bridge spanning the Icicle Creek at Rock Island Campground. These branches trend both westward and easterly for short distances along the south bank of the creek.

In addition to the bridge at Rock Island, there are road bridges across the Icicle at Doctor Creek, Bridge Creek and Rat Creek, and trail bridges at Chatter Creek and Eightmile Creek.

Other developments in Segment 2 include seven camping/picnic sites situated in the corridor between Eightmile Creek and the wilderness boundary. At one of these, Ida Creek Campground, a 500 foot stretch of riprap has been installed along the river bank to protect the improvements here. The Chatter Creek Guard Station, an historic administrative complex that has been listed on the National Register of Historic Places, is adjacent to the Chatter Creek Campground in this segment.

Segment 3

Segment 3 is 2.5 miles in length and includes two water developments: the Icicle Irrigation District dam and canal, and the City of Leavenworth water intake, both located on National Forest land in the SE 1/4 of Section 28, T.24N., R.17E. In addition, the Leavenworth National Fish Hatchery (which is located on the Icicle below the Forest boundary) and the Icicle Irrigation District have facilities on some of the high mountain lakes which drain into the Icicle via Snow Creek. These facilities allow the storage and release of additional water into the river on an "as needed" basis.

As in Segment 2, the Icicle River Road hugs the north bank of the Icicle, to within 1/2 mile of the Forest boundary. The Snow Lakes parking lot, footbridge and trailhead are located on private land near the Icicle Irrigation District diversion, in the SW 1/4 of Section 27, T.24N., R.17E. A land exchange is pending between the Forest Service and the Icicle Irrigation District that would transfer the diversion facilities to the Irrigation District, with the Forest Service acquiring the Snow Lakes Trailhead facilities in return.

Suitability:

Suitability Factor #1 -Characteristics Which Make the Area a Worthy Addition to the System.

The narrow, steep, glaciated valley of the Icicle is characterized by a cascading water course, high, open ridges, extensive snowfields, majestic peaks, and rugged slopes with large outcrops of granite. The mixed conifer cover is interspersed with frequent meadow openings.

There is heavy recreational use of the Icicle for camping, hiking, fishing, hunting, rock climbing, and water play by visitors from the Wenatchee and Central Washington communities to the east, and Puget Sound to the west. The upper drainage also serves as a major access route into the Alpine Lakes Wilderness.

Suitability Factor #2 -Current Status of Land Ownership and Use.

Approximately 30% of the study corridor is in private ownership, with these holdings being check-boarded through Segments 2 and 3. In recent years the private sections along the creek have been surveyed and are being sold as individual parcels. However, because of the area's outstanding scenic qualities, its values to the City of Leavenworth and local recreationists, and in order to protect the quality of the water in the drainage (the Icicle is the source of Leavenworth's domestic water supply), the Icicle Valley Design Review Overlay District was established by Chelan County. The District has the authority to review and make recommendations on all matters subject to the local government permit process, and has established a set of stringent standards for developments in the Icicle. This includes a restriction of 20 acres as the minimum size tract that can be subdivided.

National Forest land below the wilderness boundary has been managed under a visual quality objective of retention, which emphasizes the scenic and recreational values of the corridor. Timber harvest activities are designed to maintain the near natural condition of the corridor. Recreation use is very high, with two of the developed campgrounds in the Icicle having been expanded to accommodate this use.

Suitability Factor #3 -Foreseeable Potential Uses.

Water from the Icicle Creek has been of crucial importance to both the City of Leavenworth and the upper Wenatchee Valley. It provides the domestic water supply for the residents of Leavenworth, and the Icicle Irrigation District supplies water from Icicle Creek to most of the fruit orchards in the upper Wenatchee Valley. In addition, a national salmon hatchery is located on the Icicle, just below the Forest boundary. Both the salmon hatchery and the Irrigation District regulate the volume of flow in the lower segment of the Icicle through damming of some of the lakes at the head of Snow Creek, a major tributary of the Icicle.

A Recreational classification would allow for the existing low dam and diversion canal, as well as the intake for the Leavenworth water supply in Segment 3. However, the City of Leavenworth and surrounding area are continuing to grow in population and level of development. As a consequence, there may be a future need to expand the existing facilities to accommodate this demographic change. This expansion could be curtailed if this portion of the river is designated.

The effects of designation on other potential uses of the private land in Segments 2 and 3 are likely to be minimal, due to the present zoning and land use regulations that are in place. Scenic designation in Segment 2, where most of the development is taking place, allows for new structures as long as these are modest in size, unobtrusive, and do not have a direct and adverse effect on river values. Concentrations of habitations may occur, but are limited to relatively short reaches of the river corridor. The Icicle Valley Design Review Overlay District incorporates these objectives and would appear to adequately protect the values that would be recognized through designation of the river. However, variances to these regulations might need to be restricted in order to ensure protection of the river values.

The City of Leavenworth is a nationally advertised tourist destination. Designation of the Icicle as a Wild and Scenic River would likely increase the number of visitors to the area, and would accentuate the recreational and scenic values that have long been recognized here.

There might be some change in the management of National Forest lands, and specifically of recreation use, as a result of designation. Segment 1 is currently managed as wilderness, which emphasizes the primitive, undeveloped character of the environment. Segments 2 and 3 are presently managed under the Alpine Lakes Management Plan as Scenic Forest. The objective of this allocation is to retain or enhance the viewing and recreation experience in the Icicle, with timber management activities designed to meet this goal. If designation takes place, it is likely that there would be tighter controls on recreation use along the corridor, to ensure that the potential increase in visitors does not result in the degradation of water quality or resources within the Icicle.

With respect to mineral potential, Segment 1 is currently withdrawn from mineral entry because it lies wholly within the Alpine Lakes Wilderness. Segments 2 and 3 are not encumbered by any mining claims. Furthermore, the area has not been identified as having potential for the occurrence of locatable mineral resources, nor is it classified as being prospectively valuable for leasable mineral commodities.

Some scenic values in Segments 2 and 3 could be foreclosed if the river were not managed as part of the Wild and Scenic River System. Timber harvest on private land is regulated under the State Forest Practices Act and the State Shoreline Management Act. These allow clearcuts to within 200 feet of the river shoreline. Although the intent of designation is to follow State and County controls on private land, it is possible that designation would encourage greater sensitivity to the visual values within the Wild and Scenic corridor. In addition, designation would ensure protection of the free-flowing character of the Icicle.

Suitability Factor #4 -Public, State and Local Governmental Interests.

The overall public response to designation of the Icicle Creek as an addition to the Wild and Scenic River System has been positive. Many have expressed support for protection of the outstanding scenery and excellent recreation opportunities in the corridor. The major concerns expressed are with the potential effects of designation on the private holdings. Some of the landowners view designation as a threat to their property rights, and feel that present federal, state and local controls are adequate protection for the river values. Some are worried that the public will be given access to their lands, and that property values will fall. The Icicle Irrigation District has also expressed concerns over the effects of designation on the rehabilitation, operation and maintenance of their dam and canal. The irrigation water they provide through their facility serves some 7500 acres of agricultural land.

Chelan County officials have indicated they could not support any proposal for designation of the Icicle Creek unless the County retains jurisdiction of private lands within the designated corridor. They are also concerned about the possible effects of designation on water rights for agricultural lands below the Forest boundary. The only costs that would be shared in administration of the river would be those independent of designation, that are associated with existing County administration of the private holdings.

The Washington State Department of Wildlife is in full support of the proposed river designation, and in fact, recommends reassessment of additional rivers on the Forest for potential eligibility as Wild and Scenic Rivers. The Yakima Indian Nation, whose ceded lands include the Icicle River drainage, supports designation at the highest potential classification, although they have some concerns for potential conflicts between recreation use and the protection of fisheries and tribal fishing localities. The Yakima would like to be involved in any subsequent river management plans that might be developed.

If the Icicle Creek is included in the Wild and Scenic River System, the Forest would rely on State and County controls for administration of private lands. Valid, existing water rights, such as those held by the Icicle Irrigation District, would not be affected by designation. Any Forest recommendation for Wild and Scenic River designation would exclude Segment 3, which includes the City of Leavenworth and Icicle Irrigation District water diversions and associated facilities.

Suitability Factor #5 -Cost of Acquisition and Interests.

Costs associated with designation are related to planning and administration of the river corridor and are directed to National Forest lands. The following are the expected funding needs for the Iccle River for a total five year period:

	Expenses Expected Independent of Designation	Additional Expenses Expected with Designation
General Administration	\$10,000	\$ 10,000
Costs of Implementation		\$ 35,000
Development of Management Plan		\$120,000
Development Costs		\$ 25,000
Operation and Maintenance Costs	\$20,000	\$ 20,000
Total - First Five Years	\$30,000	\$210,000

General administration and operation and maintenance costs are estimated to continue at \$12,000 annually.

Suitability Factor #6-Other Issues and Concerns

No other major issues or concerns have been identified.

AMERICAN RIVER

Private Land 

NACHES RANGER DISTRICT

AMERICAN RIVER

Classification:

The American River, from the headwaters to the confluence with the Bumping River is considered to be eligible for inclusion in the Wild and Scenic River system. There are no private lands included within the corridor. In the course of determining eligibility, two distinct segments of the river were identified, based on a combination of physical changes in the river character, and differences in development along the river corridor. These segments consist of an upper section (Segment 1) extending from the headwaters at American Lake to the confluence with the Rainier Fork in the SE 1/4 of Section 9, T.16N., R.11E.; and a lower section (Segment 2) extending from the Rainier Fork to the confluence with the Bumping River.

Based on their highest potential classification, Segment 1 meets the standards for classification as a Wild River, and Segment 2 as a Scenic River.

Segment 1

Segment 1, which is located entirely within the William O. Douglas Wilderness, is 6 miles in length. Access along the corridor is provided by Trail #968, which parallels the east side of the river to within 2 1/2 miles of the headwaters. The trail crosses the river in the NE 1/4 of Section 29, T.16N., R.11E., for the ascent to Dewey Lake.

Segment 2

Segment 2 is 16 miles in length. The river forms the wilderness boundary through portions of this segment, with much of the south side of the corridor being located in the William O. Douglas Wilderness, and a small number of acres north of the river being situated in the Norse Peak Wilderness.

U.S. Highway 410, the Mather Memorial Parkway, closely follows the American River the length of Segment 2, providing access to the numerous campgrounds, trailheads, and recreation residence tracts that exist here. Bridges span the river in the NW 1/4 of Section 35, T.17N., R.11E., where the highway extends for a short distance to the southeast side of the river. The highway also bridges the river at Hell's Crossing and at Hall Creek. A fifth bridge spans the American near its confluence with the Bumping River, at the junction of Highway 410 with County Road #1050.

Most of the remaining developments in Segment 2 are related to recreation use. There are six trailheads along the river: Mesatchee Creek (Trail #969, which crosses to the south side of the American River via a rustic, single log footbridge in the SW 1/4 of Section 3, T.16N., R.11E.; there is also parking space for 12 vehicles at the trailhead); Union Creek (Trail #956); Pleasant Valley (Trail #957, which crosses to the south side of the American River by way of a substantial wooden trail bridge); Crow Lake Way (a fully developed trailhead for Trail #953); Fife's Peak (a minimally developed trailhead for Trail #954); and Hell's Crossing (Goat Peak Trail and Trail #999; the latter trail is a popular cross-country ski route which parallels the southern edge of the river between the Goat Peak Trail to the east and Trail #957 to the west).

There are also four developed campgrounds in Segment 2: the 34 unit Lodgepole, the 19 unit Pleasant Valley, the 17 unit Hell's Crossing, and Pine Needle Campground, a reservation campsite. In addition, six recreation residence tracts under permit to the Forest Service are scattered through the corridor here: the Timber Creek Tract with 13 residences, the Union Creek Tract with six residences, the Pleasant Valley Tract, with seven residences, the Sleepy Hollow Tract with 15 residences, and the American

River Tract with 11 residences. A Pacific Power and Light Company powerline extends from the eastern edge of Segment 2, westward along the north side of the river as far as the Sleepy Hollow Tract. A private telephone line also occupies the powerline corridor.

Suitability:

Suitability Factor #1 -Characteristics Which Make the Area a Worthy Addition to the System.

The American River is noted for its highly varied, spectacular scenery. Originating high in the William O. Douglas Wilderness, the upper course tumbles eastward through a broad, glaciated, U-shaped valley characterized, near the Cascade Crest, by immense, back-to-back cirque basins. At its lower end, the corridor changes dramatically, as the river plunges through a narrow, winding canyon accentuated by precipitous, andesite cliffs. The river course is one of cascading rapids, riffles and white water areas throughout the segments under study. Lands adjacent to Highway 410, along the north side of the river, have been designated by the Secretary of Agriculture as the Mather Memorial Parkway "for the use and the enjoyment of the general public for scenic and recreation purposes..."

Suitability Factor #2 - Current Status of Land Ownership and Use.

The proposed river corridor is located exclusively on National Forest lands. Major uses include recreation (fishing, hunting, camping, hiking, picnicking, kayaking, and cross-country skiing), and timber management activities. The lands outside the wilderness boundary have been managed under a visual quality objective of retention, which emphasizes the scenic and recreational values of the corridor. The upper six miles of the American River are managed as wilderness.

Suitability Factor #3 -Foreseeable Potential Uses.

There would be no change in management of the National Forest lands as a result of designation. Segment 1 is currently managed as wilderness, which emphasizes the primitive, undeveloped character of the environment. Segment 2, which includes the Mather Memorial Parkway, is managed primarily for scenic and recreational purposes, with special consideration given to maintaining or enhancing the visual quality of the area.

The American River has a long history of mining use. Today, Segment 1 is withdrawn from mineral entry because of its location within the William O. Douglas Wilderness. However, according to BLM mining claim recordation data, there are a total of 28 unpatented claims in Segment 2. The bulk of these are situated between the confluence of the American River with the Rainier Fork and the Pleasant Valley Campground, with the remaining three being located between Pine Needle and American Forks Campgrounds. Assessment work has been completed on all of these claims through at least 1987. There are also reported occurrences of basalt and placer gold in Section 35, T.17N., R.11E., and basalt in Section 18, T.17N., R.13E. In addition, that portion of the American River from Wash Creek westward is classified by the BLM as being prospectively valuable for geothermal resources, although the area has no reported history of geothermal exploration or development.

Designation of the river would not affect the future mining potential in Segment 2. Preexisting mining claims with valid mining rights would be allowed to continue, subject to 36 CFR 228. A Scenic classification also allows for new mining claims and mineral leases, subject to the same regulations, provided the mineral activity is conducted in a manner that minimizes environmental degradation.

There are probably few values that would be foreclosed or curtailed if the American River was not protected as part of the System. Timber management activities presently recognize the scenic and recreational values of the corridor, and the designation of the Mather Memorial Parkway further reinforces this direction. The greatest potential threat to river values, however, would be in future diversions or impoundments. Designation would ensure the protection of the free-flowing character of the *American River drainage*.

Suitability Factor #4 -Public, State and Local Governmental Interests.

The overall public response to designation of the American River as an addition to the Wild and Scenic River System has been positive. Many support recognition and protection of the outstanding scenic values here, as well as the enhancement of the recreation opportunities, and protection of the fisheries, wildlife habitat, and water quality. The few concerns expressed are with the potential effects of designation on timber harvest levels, and on mining along the river corridor.

Yakima County officials would probably not support any proposal for designation that affects their jurisdiction over private lands, or that significantly decreases the timber supply from the Naches Ranger District. However, as mentioned above, there are no private lands located within the American River segments under study for inclusion in the Wild and Scenic River System. In addition, the corridor overlaps with the Mather Memorial Parkway and, in some areas, with wilderness. Designation of the American River would have no additional effect on the timber supply.

The Washington State Department of Wildlife is in full support of the proposed river designation, and in fact, recommends reassessment of additional rivers on the Forest for potential eligibility as Wild and Scenic Rivers. The Yakima Indian Nation, whose ceded lands include the American River drainage, supports designation at the highest potential classification, although they have some concerns for potential conflicts between recreation use and the protection of fisheries and tribal fishing localities. The Yakima would like to be involved in any subsequent river management plans that might be developed.

Suitability Factor #5 -Cost of Acquisition and Interests.

There are no private lands included within the proposed Wild and Scenic corridor of the American River.

Costs associated with designation are related to planning and administration of the river corridor and are directed to National Forest lands. The following are the expected funding needs for the American River for a total five year period:

	Expenses Expected Independent of Designation	Additional Expenses Expected with Designation
General Administration	\$ 6,000	\$ 20,000
Costs of Implementation		\$ 20,000
Development of Management Plan		\$ 40,000
Development Costs	\$50,000	\$100,000
Operation and Maintenance Costs	\$10,000	\$ 15,000
Total - First Five Years	\$66,000	\$195,000

General administration and operation and maintenance costs are estimated to continue at \$10,200 annually.

Suitability Factor #6-Other Issues and Concerns.

No other major issues or concerns have been identified.

IV. ADMINISTRATIVE AND MANAGEMENT GUIDELINES

The following administrative and management guidelines are proposed to guide the development of detailed management plans for those rivers on the Wenatchee National Forest that are Congressionally designated as Wild and Scenic Rivers:

1. The Forest Service will be the administering agency for designated rivers within the Wenatchee National Forest. As the administrative agency, the Forest Service intends to manage the surface waters of the rivers or river segments, as well as the National Forest lands within the designated corridors, in accordance with the Wild and Scenic Rivers Act.
2. River corridor boundaries will be established to protect the outstandingly remarkable values for each designated river segment. These boundaries may not exceed an average of 320 acres per river mile over the designated portion of the river. The boundary will be delineated using natural or manmade features (canyon rims, roads, ridgetops, etc.), and legally identifiable property lines.
3. Every effort will be made to retain the existing patterns of land use and ownership, provided these uses remain consistent with the purposes of the Act.
4. State and County laws and regulations may be sufficient to protect river values on non-Federal lands. Rather than impose another layer of control on these lands, it will be the intent of the Management Plan to rely on State and County controls for administration of the private land within the designated rivers.

5. The Forest Service will monitor the results of local controls against the values for which the various rivers or river segments were designated. In the event that local controls do not appear to provide the necessary protection, the Forest Service will initiate discussions with County and/or State Agencies to determine the action needed to obtain necessary protection.

6. If local government action cannot be implemented, it may be necessary to impose additional controls for protection of some segments of designated rivers. Where key values are in jeopardy, this would most likely require acquisition of easements from private landowners.

7. This management concept for non-Federal lands will require close and frequent coordination between the Forest Service and Counties. To clearly define the authorities and responsibilities between the Forest Service and Counties, a series of cooperative agreements will be prepared.

8. Conflicts between public use and private landowners will be minimized to the extent possible. Access easements across private lands will be used only where no viable alternatives exist. (At this time, the only private land access easement that has been identified for acquisition is at Plain, just upstream from the SR 209 bridge crossing of the Wenatchee River.) Designation as a Wild and Scenic River does not change or affect existing public access on private lands.

9. Public use and enjoyment of designated rivers will be provided for, while protecting the values that caused these rivers to be included in the System. In this regard, public use will be regulated and distributed, where necessary, to protect and enhance these values. Basic facilities will be provided to absorb user impacts on the resources, as appropriate.

10. Valid water rights will not be affected by Wild and Scenic River designation. Existing dams and diversions and similar water projects located on designated river segments will be allowed to continue, subject to other applicable laws and regulations. New water project proposals will be evaluated on their potential to directly or adversely affect the attributes which made the river eligible for inclusion in the Wild and Scenic River System.

11. A proviso to allow riprapping will be recommended for inclusion in legislation for designation of "Recreational" river segments on the Forest. The riprap would be confined to the use of natural appearing rock along the shoreline for the preservation and protection of those investments existing before designation of the rivers, providing that there are no other viable alternatives short of abandonment.

12. Development of the detailed river management plans will provide for full citizen participation by landowners and river users.

APPENDIX F

Analysis of Land Allocations by Subwatersheds and Alternatives

Twenty-five major subbasins have been identified on the Wenatchee National Forest. This appendix is a grouping by alternative of land allocations and ownerships within each of these subbasins. The allocations and their percentages within a subwatershed were used in the analysis of the consequences of the alternatives. This information was used to identify potential individual and cumulative impacts affecting the various environmental components. The descriptions of the column headings follow:

Total Acres: Acres in the subwatershed within the Forest boundary.

Private Acres: Acres within the Forest boundary which are in other ownership, private or other agency. In some cases, the private acres within a subwatershed may be concentrated in one area. This could be an important factor for evaluating cumulative effects in intermingled ownerships.

Wilderness Acres: These are acres in designated wilderness.

Intensive Harvest Acres: Those acres within the subwatershed which are allocated to intensive timber harvest prescriptions. "Intensive" harvest prescriptions include all General Forest (GF) allocations and the Range Management (RM-1) allocation.

Other Harvest Acres: Acres of land within the subwatershed on which timber will be harvested but not by intensive harvest prescriptions. The special yield tables were applied to timber harvests on these acres.

Unharvested Acres: Those acres in allocations which will not permit harvesting. Not included in these acres are private or wilderness acres which have been separated out in the special categories listed above.

APPENDIX G

TREATY WITH THE YAKIMA

INTRODUCTION

The Wenatchee National Forest is within the area ceded to the U.S. Government by the Treaty with the Yakima, 1855. This treaty reserved to the confederated tribes and bands of the Yakima Indian Nation certain rights and privileges to these ceded lands. Among the most important rights with respect to management of the Forest are those identified in Article 3: "...the right of taking fish at all usual and accustomed places in common with the citizens of the territory, and of erecting temporary buildings for curing them; together with the privilege of hunting, gathering roots and berries, and pasturing their horses and cattle upon open and unclaimed land..." This right includes consideration by the Forest Service of the environmental effects of their land management activities on the water quality and anadromous fish habitat of the Forest.

Certain additional uses of the Forest lands by the American Indians are authorized by P.L. 95-341, the Joint Resolution on American Indian Religious Freedom (AIRFA). This Act states that it shall be the policy of the United States to protect and preserve for American Indians their inherent right of freedom to believe, express and exercise their traditional religions. This includes, but is not limited to, access to sites, use and possession of sacred objects and the freedom to worship through ceremonials and traditional rites. This Act directs Federal Departments and Agencies to evaluate their policies and procedures *in consultation with Native traditional religious leaders in order to determine appropriate changes necessary to protect and preserve Native American religious rights and practices.*

The following are complete copies of the Treaty with the Yakima, 1855 and the American Indian Religious Freedom Act.

TREATY WITH THE YAKIMA, 1855

June 9, 1855
 12 Stat. 951
 Ratified Mar. 8, 1859
 Proclaimed Apr. 18,
 1859

Articles of agreement and convention made and concluded at the treaty-ground, Camp Stevens, Walla-Walla Valley, this ninth day of June, in the year one thousand eight hundred and fifty-five, by and between Isaac I. Stevens, governor and superintendent of Indian affairs for the Territory of Washington, on the part of the United States and the undersigned head chiefs, chiefs, head-men, and delegates of the Yakama, Palouse, Piquouse, Wenatshapam, Klkakat, Klinguit, Kow-was-say-ee, Li-ay-was, Skin-pah, Wish-ham, Shyrks, Oche-chotes, Kah milt-pah, and Se-ap-cat, confederated tribes and bands of Indians, occupying lands hereinafter bounded and described and lying in Washington Territory, who for the purposes of this treaty are to be considered as one nation, under the name of "Yakama," with Kamaiakun as its head chief, on behalf of and acting for said tribes and bands, and being duly authorized thereto by them.

Cession of lands to
 the United States

ARTICLE 1. The aforesaid confederated tribes and bands of Indians hereby cede, relinquish, and convey to the United States all their right, title, and interest in and to the lands and country occupied and claimed by them, and bounded and described as follows, to wit.

Boundaries

Commencing at Mount Ranier, thence northerly along the main ridge of the Cascade Mountains to the point where the northern tributaries of Lake Che-lan and the southern tributaries of the Methow River have their rise; thence southeasterly on the divide between the waters of Lake Che-lan and the Methow River to the Columbia River; thence, crossing the Columbia on a true east course, to a point whose longitude is one hundred and nineteen degrees and ten minutes, (119° 10',) which two latter lines separate the above confederated tribes and bands from the Oakinakane tribe of Indians, thence in a true south course to the forty-seventh (47°) parallel of latitude, thence east on said parallel to the main Palouse River, which two latter lines of boundary separate the above confederated tribes and bands from the Spokanes; thence down the Palouse River to its junction with the Moh-hah-ne-she, or southern tributary of the same; thence in a southeasterly direction, to the Snake River, at the mouth of the Tucannon River, separating the above confederated tribes from the Nez Percé tribe of Indians; thence down the Snake River to its junction with the Columbia River: thence up the Columbia River to the "White Banks" below the Priest's Rapids, thence westerly to a lake called "La Lac;" thence southerly to a point on the Yakama River called Toh-mah-luke; thence, in a southwesterly direction, to the Columbia River, at the western extremity of the "Big Island," between the mouths of the Umatilla River and Butler Creek; all which latter boundaries separate the

TREATY WITH THE YAKIMA, 1855.

above confederated tribes and bands from the Walla-Walla, Cayuse, and Umatilla tribes and bands of Indians; thence down the Columbia River to midway between the mouths of White Salmon and Wind Rivers: thence along the divide between said rivers to the main ridge of the Cascade Mountains; and thence along said ridge to the place of beginning.

ARTICLE 2. There is, however, reserved, from the lands above ceded for the use and occupation of the aforesaid confederated tribes and bands of Indians, the tract of land included within the following boundaries, to wit Commencing on the Yakama River, at the mouth of the Attah-nam River: thence westerly along said Attah-nam River to the forks; thence along the southern tributary to the Cascade Mountains: thence southerly along the main ridge of said mountains passing south and east of Mount Adams, to the spur whence flows the waters of the Klickitat and Pisco Rivers; thence down said spur to the divide between the waters of said rivers, thence along said divide to the divide separating the waters of the Satass River from those flowing into the Columbia River; thence along said divide to the main Yakama, eight miles below the mouth of the Satass River; and thence up the Yakama River to the place of beginning.

Reservation.

Boundaries

All which tract shall be set apart and, so far as necessary, surveyed and marked out, for the exclusive use and benefit of said confederated tribes and bands of Indians, as an Indian reservation; nor shall any white man, excepting those in the employment of the Indian Department, be permitted to reside upon the said reservation without permission of the tribe and the superintendent and agent. And the said confederated tribes and bands agree to remove to, and settle upon, the same, within one year after the ratification of this treaty. In the mean time it shall be lawful for them to reside upon any ground not in the actual claim and occupation of citizens of the United States; and upon any ground claimed or occupied, if with the permission of the owner or claimant.

Reservations to be set apart etc. and Indians to settle thereon
Whites not to reside thereon

Guaranteeing, however, the right to all citizens of the United States to enter upon and occupy as settlers any lands not actually occupied and cultivated by said Indians at this time, and not included in the reservation above named.

And provided, That any substantial improvements heretofore made by any Indian, such as fields enclosed and cultivated, and houses erected upon the lands hereby ceded, and which he may be compelled to abandon in consequence of this treaty, shall be valued, under the direction of the President of the United States, and payment made therefor in money; or improvements of an equal value made for said Indian upon the reservation. And no Indian will be required to abandon the improvements aforesaid, now occupied by him, until their value in money, or improvements of an equal value shall be furnished him as aforesaid.

Improvements on ceded lands

ARTICLE 3. *And provided,* That, if necessary for the public convenience, roads may be run through the said reservation; and on the other hand, the right of way, with free access from the same to the nearest public highway, is secured to them, as also the right, in common with citizens of the United States, to travel upon all public highways

Roads may be made.

The exclusive right of taking fish in all the streams, where running through or bordering said reservation, is further secured to said confederated tribes and bands of Indians, as also the right of taking fish at all usual and accustomed places, in common with the citizens of the Territory, and of erecting temporary buildings for curing them: together with the privilege of hunting, gathering roots and berries, and pasturing their horses and cattle upon open and unclaimed land.

Privileges secured to Indians

TREATY WITH THE YAKIMA, 1855

<p>Payments by the United States</p>	<p>ARTICLE 4 In consideration of the above cession, the United States agree to pay to the said confederated tribes and bands of Indians, in addition to the goods and provisions distributed to them at the time of signing this treaty, the sum of two hundred thousand dollars, in the following manner, that is to say: Sixty thousand dollars, to be expended under the direction of the President of the United States, the first year after the ratification of this treaty, in providing for their removal to the reservation, breaking up and fencing farms, building houses for them, supplying them with provisions and a suitable outfit, and for such other objects as he may deem necessary, and the remainder in annuities, as follows. For the first five years after the ratification of the treaty ten thousand dollars each year, commencing September first, 1856; for the next five years, eight thousand dollars each year, for the next five years, six thousand dollars per year; and for the next five years, four thousand dollars per year.</p>
<p>How to be applied</p>	<p>All which sums of money shall be applied to the use and benefit of said Indians, under the direction of the President of the United States, who may from time to time determine, at his discretion, upon what beneficial objects to expend the same for them. And the superintendent of Indian affairs, or other proper officer, shall each year inform the President of the wishes of the Indians in relation thereto.</p>
<p>United States to establish schools</p>	<p>ARTICLE 5. The United States further agree to establish at suitable points within said reservation, within one year after the ratification hereof, two schools, erecting the necessary buildings, keeping them in repair, and providing them with furniture, books, and stationery, one of which shall be an agricultural and industrial school, to be located at the agency, and to be free to the children of the said confederated tribes and bands of Indians, and to employ one superintendent of teaching and two teachers; to build two blacksmiths' shops, to one of which shall be attached a tin-shop, and to the other a gunsmith's shop: one carpenter's shop, one wagon and plough maker's shop, and to keep the same in repair and furnished with the necessary tools to employ one superintendent of farming and two farmers, two blacksmiths, one tinner, one gunsmith, one carpenter, one wagon and plough maker, for the instruction of the Indians in trades and to assist them in the same; to erect one saw-mill and one flouring-mill, keeping the same in repair and furnished with the necessary tools and fixtures, to erect a hospital, keeping the same in repair and provided with the necessary medicines and furniture, and to employ a physician, and to erect, keep in repair, and provided with the necessary furniture, the building required for the accommodation of the said employees. The said buildings and establishments to be maintained and kept in repair as aforesaid, and the employees to be kept in service for the period of twenty years.</p>
<p>Mechanics' shops</p>	<p>And in view of the fact that the head chief of the said confederated tribes and bands of Indians is expected, and will be called upon to perform many services of a public character, occupying much of his time, the United States further agree to pay to the said confederated tribes and bands of Indians five hundred dollars per year, for the term of twenty years after the ratification hereof, as a salary for such person as the said confederated tribes and bands of Indians may select to be their head chief, to build for him at a suitable point on the reservation a comfortable house, and properly furnish the same, and to plough and fence ten acres of land. The said salary to be paid to, and the said house to be occupied by, such head chief so long as he may continue to hold that office.</p>
<p>Sawmill and flouring mill Hospital.</p>	<p>And it is distinctly understood and agreed that at the time of the conclusion of this treaty Kamaiakun is the duly elected and authorized</p>
<p>Salary to head chief house etc</p>	<p></p>
<p>Kamaiakun is the head chief</p>	<p></p>

TREATY WITH THE YAKIMA, 1855.

head chief of the confederated tribes and bands aforesaid, styled the Yakama Nation, and is recognized as such by them and by the commissioners on the part of the United States holding this treaty, and all the expenditures and expenses contemplated in this article of this treaty shall be defrayed by the United States, and shall not be deducted from the annuities agreed to be paid to said confederated tribes and band of Indians. Nor shall the cost of transporting the goods for the annuity payments be a charge upon the annuities, but shall be defrayed by the United States.

ARTICLE 6. The President may, from time to time, at his discretion, cause the whole or such portions of such reservation as he may think proper, to be surveyed into lots, and assign the same to such individuals or families of the said confederated tribes and bands of Indians as are willing to avail themselves of the privilege, and will locate on the same as a permanent home, on the same terms and subject to the same regulations as are provided in the sixth article of the treaty with the Omahas, so far as the same may be applicable.

Reservation may be surveyed into lots and assigned to individuals or families

ARTICLE 7. The annuities of the aforesaid confederated tribes and bands of Indians shall not be taken to pay the debts of individuals

Annuities not to pay for debts of individuals

ARTICLE 8 The aforesaid confederated tribes and bands of Indians acknowledge their dependence upon the Government of the United States, and promise to be friendly with all citizens thereof, and pledge themselves to commit no depredations upon the property of such citizens.

Tribes to preserve friendly relations

And should any one or more of them violate this pledge, and the fact be satisfactorily proved before the agent, the property taken shall be returned, or in default thereof, or if injured or destroyed, compensation may be made by the Government out of the annuities.

To pay for depredations

Nor will they make war upon any other tribe, except in self-defence, but will submit all matters of difference between them and other Indians to the Government of the United States or its agent for decision, and abide thereby. And if any of the said Indians commit depredations on any other Indians within the Territory of Washington or Oregon, the same rule shall prevail as that provided in this article in case of depredations against citizens. And the said confederated tribes and bands of Indians agree not to shelter or conceal offenders against the laws of the United States, but to deliver them up to the authorities for trial.

Not to make war but in self-defence

To surrender offenders

ARTICLE 9. The said confederated tribes and bands of Indians desire to exclude from their reservation the use of ardent spirits, and to prevent their people from drinking the same, and, therefore, it is provided that any Indian belonging to said confederated tribes and bands of Indians, who is guilty of bringing liquor into said reservation, or who drinks liquor, may have his or her annuities withheld from him or her for such time as the President may determine.

Annuities may be withheld from those who drink ardent spirits

ARTICLE 10 *And provided,* That there is also reserved and set apart from the lands ceded by this treaty, for the use and benefit of the aforesaid confederated tribes and bands, a tract of land not exceeding in quantity one township of six miles square, situated at the forks of the Pisquouse or Wenatshapam River, and known as the "Wenatshapam Fishery," which said reservation shall be surveyed and marked out whenever the President may direct, and be subject to the same provisions and restrictions as other Indian reservations

Wenatshapam fishery reserved

ARTICLE 11. This treaty shall be obligatory upon the contracting parties as soon as the same shall be ratified by the President and Senate of the United States.

When treaty to take effect.

In testimony whereof, the said Isaac I. Stevens, governor and superintendent of Indian affairs for the Territory of Washington, and the undersigned head chief, chiefs, headmen, and delegates of the afore-

said confederated tribes and bands of Indians, have hereunto set their hands and seals, at the place and on the day and year hereinbefore written

ISAAC I. STEVENS,
Governor and Superintendent. [L. s.]

Kamaiakun, his x mark.	{ L s }	Wish-och-kmpits, his x mark.	{ L s }
Skloom, his x mark	{ L s }	Koo-lat-tooe, his x mark	{ L s }
Owhi, his x mark.	{ L s }	Shee-ah-cotte, his x mark	{ L s }
Te-cole-kun, his x mark	{ L s }	Tuck-quille, his x mark	{ L s }
La-boom, his x mark	{ L s }	Ka-loo-as, his x mark	{ L s }
Me-ni-nock, his x mark	{ L s }	Scha-noo-a, his x mark	{ L s }
Elit Palmer, his x mark	{ L s }	Sia-kish, his x mark	{ L s }

Signed and sealed in the presence of—

James Doty, secretary of treaties,
Mie des Pandosy, O M T,
Wm C McKay,
W. H Tappan, sub Indian agent, W T,
C Chirouse, O M T,
Patrick McKenzie, interpreter,
A. D Pamburn, interpreter,
Joel Palmer, superintendent Indian affairs, O T.,

American Indian Religious Freedom

- Act of August 11, 1978 (P.L. 95 341, 92 Stat. 469, 42 U.S.C. 1996(note))

Whereas the freedom of religion for all people is an innerent right, fundamental to the democratic structure of the United States and is guaranteed by the First Amencment of the United States Constitution;

Whereas the United States has traditionally rejected the concept of a government denying individuals the right to practice their religion and, as a result, has benefited from a rich variety of religious heritages in this country,

Whereas the religious practices of the American Indian (as well as Native Alaskan and Hawaiian) are an integral part of their culture, tradition and heritage, such practices forming the basis of Indian identity and value systems,

Whereas the traditional American Indian religions, as an integral part of Indian life, are indispensable and irreplaceable,

Whereas the lack of a clear, comprehensive, and consistent Federal policy has often resulted in the abridgment of religious freedom for traditional American Indians;

Whereas such religious infringements result from the lack of knowledge or the insensitive and inflexible enforcement of Federal policies and regulations premised on a variety of laws,

Whereas such laws were designed for such worthwhile purposes as conservation and preservation of natural species and resources but were never intended to relate to Indian religious practices and, therefore, were passed without consideration of their effect on traditional American Indian religions,

Whereas such laws and policies often deny American Indians access to sacred sites required in their religions, including cemeteries,

Whereas such laws at times prohibit the use and possession of sacred objects necessary to the exercise of religious rites and ceremonies,

Whereas traditional American Indian ceremonies have been intruded upon, interfered with, and in a few instances banned. Now, therefore, be it

Resolved by the Senate and House of Representatives
of the United States of America in Congress assembled,

That henceforth it shall be the policy of the United States to protect and preserve for American Indians their inherent right of freedom to believe, express, and exercise the traditional religions of the American Indian, Eskimo, Aleut, and Native Hawaiians, including but not limited to access to sites, use and possession of sacred objects, and the freedom to worship through ceremonials and traditional rites.

Sec. 2. The President shall direct the various Federal departments, agencies, and other instrumentalities responsible for administering relevant laws to evaluate their policies and procedures in consultation with native traditional religious leaders in order to determine appropriate changes necessary to protect and preserve Native American religious cultural rights and practices. Twelve months after approval of this resolution, the President shall report back to the Congress the results of his evaluation, including any changes which were made in administrative policies and procedures, and any recommendations he may have for legislative action.

APPENDIX H

SELECTION OF HARVEST CUTTING METHOD

Silvicultural systems are used to manage forest stands. A silvicultural system is a planned sequence of treatments for controlling the species composition and structure of the vegetation during the life of a stand. A stand is a community of trees sufficiently uniform to be distinguishable as a silvicultural or management unit. Typically, stand sizes vary from about 5 acres to over 30 acres on National Forest lands.

Silvicultural systems are not just the creation of foresters; rather, they are adaptations of natural occurrences. Natural “regeneration” occurs by means of fire, insects, disease, wind, and other phenomena; by removing a single tree, a small group of trees, a stand, or sometimes a whole forest.

Harvest Cutting Methods

Harvest cutting methods include both even-aged and uneven-aged silvicultural systems.

Even-aged harvest cutting systems (silvicultural treatment methods) generally include clearcutting, shelterwood cutting, and seedtree cutting.

Uneven-aged harvest cutting systems generally include individual tree selection and group selection cutting when healthy, fully stocked, uneven-aged stands exist or can be created by identified treatments within a defined time period.

An intermediate type of management for special areas needing constant tree cover and live root masses is two-story extended rotation stand management. This type of management utilizing long rotation shelterwoods, combines some of the resource protection features of uneven-aged management with the features of even-aged management that optimizes economics, simplifies yield prediction, and improves disease control opportunities.

As shown in Chapter III, two-storied stands are the predominant or characteristic existing stand condition on dry ecotype sites.

The two-storied stand condition is less common in the wet area but still occupy 25 percent of this ecotype.

Two-storied stands rather than strictly even-aged or all age were selected as the proposed models to meet old-growth dependent species, key big game habitat, scenic travel, riparian, Scenic River, and Recreational River management emphasis allocations. Sketches of how such stands would look are shown in Chapter IV. Also refer to graphic “Timber Yield Table - Special” for predicted yields, tree sizes at 130 and 260 years, and number of trees left at shelterwood entry.

Calculated yields using the constant tree cover shelterwood system varies from a low of 73 percent of the general forest wet type for riparian areas to 89 percent for the partial retention visual prescription. (These are based on the percentage of GF-1 yield). This approximates the maximum potential yield.

These yields are approximately 10 percent above potential yield using an even-aged 260 year rotation system.

Detailed monitoring of the use of the two-story system is needed during the next 10 years to determine if this potential gain over single story even-aged management is being accomplished.

The biggest questions to be answered by monitoring are, (1) the effects of diseases especially mistletoe and root rots on growth of trees under an overstory and, (2) the suppressive effect of the overstory on growth of the new stand under managed conditions.

The intent here is to document the rationale for selection of the broad harvest cutting methods (even-aged or uneven-aged) to be applied on the Forest. The specific silvicultural system (such as clearcutting, seedtree cutting, or group selection) will be selected on a site specific basis as identified in environmental assessments or in silvicultural prescriptions written or approved by certified silviculturists.

The criteria used for selection of harvest cutting methods were developed using selection criteria identified in the Regional Guide for the Pacific Northwest Region (1984) as well as direction provided in 36 CFR 219.27(b) for management prescriptions that involve manipulation of tree cover.

Combined Criteria for Selection of Harvest Cutting Method

The criteria identified in the Regional Guide and in 36 CFR 219.27(b) have been combined to eliminate duplication of intent and simplify the rationale for selecting the harvest cutting methods used to implement the Forest Plan. These seven combined criteria are summarized as follows:

1. The selected harvest cutting method must permit the production of a volume of marketable trees sufficient to utilize all trees that meet utilization standards and are designated for harvest. (Regional Guide: Criteria 1)
2. The selected harvest cutting method must permit use of an available and acceptable logging method *which can remove designated trees without excessive damage to the identified desirable residual vegetation* while meeting other established land management objectives. Table 2-1 in the Regional Guide displays the compatibility of logging systems with common harvest cutting methods. Generally, ground based logging methods, helicopters, and cable methods using slack pulling carriages are appropriate for all harvest methods. Cable methods without slack pulling carriages and balloons are appropriate only for clearcuts. (Regional Guide: Criteria 2, 36 CFR 219.27(b): Criteria 4)
3. The selected harvest cutting method must be capable of providing special conditions, such as a continuous high density live root mats, that are required to meet resource management objectives. Table 2-2 in the Regional Guide displays commonly used harvest methods which achieve desired forest character. Generally, both even-aged and uneven-aged methods can meet desired forest character with the exception of the "mosaic of forest and openings," and "maximum wildlife species diversity" objectives. Here, uneven-aged methods are not applicable. (Regional Guide: Criteria 3 and 6, 36 CFR 219.27(b): Criteria 1 and 6)

The selected harvest cutting method must meet multiple-use biological, environmental, engineering, and economic management objectives identified in the Regional Guide and Forest Plan.

4. The selected harvest cutting method must permit control of vegetation to establish desired numbers and rates of growth of trees as well as other vegetation needed to achieve special management objectives. Tables 2-3 and 2-4 in the Regional Guide outline these harvest cutting methods. Generally, both even-aged and uneven-aged methods can be used in vegetation zones occurring on the Forest; however, uneven-aged methods are not applicable for wildlife forage production or optimum tree seedling and sapling growth. (Regional Guide: Criteria 4, 36 CFR 219.27(b): Criteria 4 and 6)

5. The selected harvest cutting method must promote a stand structure and species composition which minimizes serious risk from insects, disease, animal damage, and wildfire and will allow treatment of existing insect, disease, and fuel conditions. Table 2-5 in the Regional Guide displays harvest cutting methods favorable to the reduction and treatment of these agents. Generally, uneven-aged methods are not applicable where dwarf mistletoe and root disease present serious risks. (Regional Guide: Criteria 5)

6. The selected method must assure that lands can be adequately restocked, (36 CFR 219.27(b): Criteria 2)

7. The selected method must be practical and economical in terms of transportation, harvesting, preparation, and administration of timber sales. (36 CFR 219.27(b): Criteria 7)

In addition, no harvest cutting method was selected primarily because it resulted in the greatest dollar return or provided the highest output of timber, or which permanently reduced site productivity, or could not assure conservation of the water and soil resources. (36 CFR 219.27(b): Criteria 3 and 5)

Dry Forest (Ponderosa Pine - Douglas-Fir Climax Forest)

Past harvesting in this type was largely individual tree selection or overwood removals. Due to increased recognition of root rots, mistletoe, and western spruce budworm potential, clearcutting has increased in this type. Clearcutting allows for regeneration of ponderosa pine from select parent trees under the tree improvement program for the forest.

Clearcutting also allows for more complete removal of fire hazard through broadcast burning or utilization of logging residue. Clearcutting mature stands or two-storied stands on north slopes even in the dry zone is clearly optimal where mistletoe or root rots are problems and soils allow for successful planting. For mature ponderosa pine stands, Alexander (1986) recommends against partial cutting stands with a mistletoe rating of 3 or more using a 6 point rating system. Douglas-fir mistletoe is even more serious than ponderosa pine mistletoe. (Hadfield 1986)

Ponderosa pine is the preferred planting species, where adapted, because of the high demand for its lumber, and its relative resistance to many disease and insect problems.

One concern is marketing of second growth ponderosa pine. High moisture content and rapid taper make second growth ponderosa less desirable than old growth ponderosa and in many cases less desirable than associated species such as Douglas-fir and lodgepole pine. On the other hand, ponderosa pine grown on longer rotations, such as proposed for visual management areas, will return a premium value that may be underestimated using current values. Our proposed management on many of these sites will be to remove associated species during the commercial thinning and shelterwood harvest stages while retaining the best quality ponderosa pine for increased stumpage values and other resources, especially scenery.

The ponderosa is also favored in campground and high density recreation areas because of its deep tap root. This makes it less subject to windthrow hazard. Its thick bark protects it from fire and mechanical injuries. The cinnamon to yellow-colored bark is also desirable from a scenery standpoint as it adds color variety to the Forest.

McDonald (1976) found that the degree of stocking, rate of growth, and species of trees were all affected by cutting method.

Ponderosa pine, the most desired species on much of the dry forest area was found to grow best in clearcuts. Leaving four to eight seed trees per acre reduced growth by forty percent on ponderosa pine seedling. Growth was reduced by sixty-six percent when twelve shelterwood trees were left per acre.

The number of new seedlings established, however, is greater under shelterwood or seed tree methods. Therefore, on sites where this is the primary concern, these methods may be optimal for establishing a new stand. McDonald (1976) recommends removal of residual trees within two years after establishment, however, to decrease growth reductions.

Single tree or group selections decreased both the stocking and growth of ponderosa pine, but increased the stocking of shade tolerant white fir. White fir grew less than ponderosa pine in clearcuts, but was favored by shelterwood cutting where it grew slightly better than ponderosa pine. Establishment of new white fir seedlings was greatest under selection methods. However, growth was only thirty-five percent of what it was in clearcuts.

Dry or extremely rocky, south slopes on the other hand may need shelter trees or in extreme cases, may call for uneven-aged management. Stands on sites in between these extremes are common. Other factors including economics are included in the site specific analysis and prescription prepared by or reviewed by a certified silviculturist.

Wet Forest (True Firs, Hemlock, Cedar, and Spruce Climax Forest)

Even-aged management, usually by clearcutting, is the optimal silviculture method for most of this type. Shallow root systems in true firs, hemlocks, cedars, and spruce make windthrow a problem with heavy cutting in previously unmanaged stands. Although these species are the climax species in this ecotype, Douglas-fir and even ponderosa pine are very common seral species currently occupying the sites due to fire or other disturbances.

Some shelterwood is required to obtain successful regeneration on extremely rocky, wet or frost pocket areas. High elevation types composed of silver fir, alpine fir and mountain hemlock may be managed under uneven-aged management where heavy snow accumulations make planting difficult and early growth extremely slow.

Preserving the fastest growing trees at each harvest can maintain these stands in a fully stocked productive state. However, logging or slash disposal can damage the leave trees causing disease and poor stocking unless careful planning and administration is carried out.

Comparisons of silvicultural methods in the mixed conifer type in southwestern Oregon was completed by Minore (1977). He found ponderosa pine to reproduce best in large clearcuts. Douglas-fir and grand fir were more successful in small clearcuts. Growth of Douglas-fir seedlings was eighteen percent less in small clearcuts, and forty-six percent less in partial cuts compared to large clearcuts. Both reduced height growth and logging damage from removal of adjacent timber has been observed on small Wenatchee forest clearcuts. For these reasons, clearcutting in units larger than ten acres is optimal for maximum growth for average growing conditions in the moist ecotype on the Wenatchee forest.

Clearcutting favors shade intolerant species including ponderosa pine, Douglas-fir, noble fire, western white pine, and western larch. These are the preferred species where they can be successfully grown. Areas of excessive wet snow, extreme frost, or high water tables may require the use of shade tolerant species, such as pacific silver fir, alpine fir, and mountain hemlock, which are more adapted to uneven-aged management. These have lower economic value, slower growth rates, and are more easily damaged by fire. Therefore, these species are favored only where the preferred species are not ecologically well adapted.

Working Groups and Management Areas

Elevation, soil types, precipitation and aspect combine to create a wide variety of ecological vegetative types on the Forest. The two tentatively suitable vegetative types and condition class, and their applicable management emphasis combinations are summarized as follows:

Vegetative Types and Condition Class	Management Emphasis - The Following are Appropriate for Both Dry and Wet Forest Types
Dry Forest (Ponderosa pine and Douglas-fir Ecotypes)	
Mature	
Immature One-Story	
Immature Two-Story	
Seedlings and Saplings	
Bare Ground	
AND	
Wet Forest (All other ecotypes)	
Mature	
Immature One-Story	
Immature Two-Story	
Seedlings and Saplings	
Bare Ground	
	Critical Big Game Habitat (EW-1) 1/ Riparian-Aquatic Ecosystems (EW-2) 1/ Old-Growth Ecosystems (OG-2) 1/ Scenic Travel Corridors - Retention VQO (ST-1) 1/ Scenic Travel Corridors - Partial Retention VQO (ST-2) 1/ General Forest - Clearcut - Timber Emphasis (GF-1; GF-3; GF-4) General Forest - Shelterwood - Timber Emphasis (GF-5; GF-6) Scenic River (WS-1) 1/ Recreational River (WS-2) 1/ Intensive Range Management (RM-1)

1/ Two-story extended rotation stand management.

Ecotype	Site Conditions	Management Prescriptions	Usual Optimum Silvicultural System	Remarks
Dry	Uneven-aged, healthy, nearly pure ponderosa pine stands.	All allowing harvest.	Uneven-aged management.	Applies to less than 5 percent of suitable forest land.
	Even-aged, mature, diseased, or stands where Douglas-fir is the primary regenerating species.	General forest.	Even-aged management featuring clearcutting for most north slopes where adequate regeneration can be assured within five years, and shelterwood for many south slopes or extremely rocky areas where regeneration may require shelter trees for regeneration within ten years.	
		"Special" prescriptions for wildlife, scenic values, and riparian zones.	Intermediate longer rotation, extended shelterwood.	Clearcutting or seed tree may be necessary, especially where mistletoe or root diseases are serious problems.
	Uneven-aged, high elevation alpine fir, Pacific silver fir, and mountain hemlock stands on difficult reforestation sites.	All allowing harvest.	Uneven-aged management.	Clearcutting may be applied where conversion to lodgepole pine is desired and can be accomplished within ten years.

Ecotype	Site Conditions	Management Prescriptions	Usual Optimum Silvicultural System	Remarks
Wet	Even-aged, mature stands of mixed conifer and lodgepole pine types.	General forest.	Even-aged favor clearcutting for most areas where regeneration can be assured within five years. Seed trees are encouraged, especially where full crowned western larch or ponderosa pine are available. Shelterwoods are to be used for areas where regeneration needs protection from frost, extreme exposure to sun, wind, or increased water tables.	Clearcutting or seed tree methods will often be needed for root rot or heavy mistletoe areas.
		"Special" areas where prescriptions emphasize wildlife, scenic, or riparian values.	Intermediate longer rotation, or extended shelterwoods preferred.

APPENDIX I

ANALYSIS OF MANAGEMENT REQUIREMENTS

PURPOSE

This appendix presents information responding to decisions of the Chief of the Forest Service and the Deputy Assistant Secretary of Agriculture regarding Appeal Number 1770, brought by the Northwest Forest Resource Council on September 18, 1986. The appeal centered on direction from the Regional Forester to incorporate management requirements (MR's) into Forest Plan alternatives.

Appellants requested that the appropriateness of the MR's be examined through the environmental impact statement process. This analysis is intended to address the issue raised by the appellants. In the analysis, alternate ways of meeting the management requirements are examined and their opportunity costs (losses in economic efficiency and timber available for harvest) are compared.

BACKGROUND OF THE MANAGEMENT REQUIREMENTS

WHAT ARE MANAGEMENT REQUIREMENTS AND WHAT ROLE DO THEY PLAY IN FOREST PLANNING?

To assure consistency in applying the laws and regulations to planning, Forest Service National and Regional direction established those substantive requirements of the regulations which must be met in all Forest Plan alternatives.

Regulations for forest planning were derived from the National Forest Management Act of 1976 (NFMA) and are found in Section 36 of the Code of Federal Regulations, Part 219. These regulations specified the "minimum specific management requirements to be met in accomplishing the goals and objectives of the National Forest System" [36 CFR 219.27]. The term "management requirements" (MR's) is used throughout this document to refer to the regulations. In the Wenatchee Draft EIS and Plan, they were referred to as "minimum management requirements," or MMR's. This term is no longer used.

Some requirements are procedural and need not be dealt with here. Some were analyzed and subjected to public review in the Regional Guide Environmental Impact Statement (EIS) process; those too do not need to be dealt with here. The management requirements which have not been fully dealt with elsewhere, and require additional analysis, are those for timber harvest dispersion, viable populations of existing native vertebrate species, and water quality/riparian habitat. Each of these management requirements is described in later sections of this appendix.

LEGAL REQUIREMENTS VS. IMPLEMENTATION METHODS

The management requirements from NFMA and its implementing regulations are legal requirements. They represent "ends" which must be met during forest plan implementation. For example, the NFMA implementing regulations require that "fish and wildlife habitat shall be managed to maintain viable populations of existing and desired non-native vertebrate species in the planning area." It is mandatory that whatever implementation methods are chosen, the management requirement be met.

Specifications or standards for achievement for each management requirement are established at the national level or through analysis at the regional level for most of the management requirements. These are listed in the regulations or as standards and guidelines in the Regional Guide.

The specifications must be based on knowledge of the resources involved. For example, in meeting the management requirement for viable populations of vertebrate species it is necessary to define the type of habitat required by the species, the maximum distance between habitats which will still provide reasonable assurance of genetic interaction, and the size of habitat area needed to support a breeding pair.

Often, the pool of scientific knowledge is insufficient to provide the entire basis for defining the specific conditions or standards that will satisfy or meet a management requirement. When this happens it is necessary to rely on the field experience and the professional judgement of knowledgeable professionals and to establish monitoring and research that will provide better information for future planning efforts.

Implementation methods are the “means” or “ways” in which the management requirements will be met. Usually there is more than one way in which a management requirement can be met. Determining the most appropriate means of meeting the specifications for each management requirement involves careful analysis at the Forest level. Considering and analyzing different means or ways of meeting a specific management requirement are particularly important if there are potentially significant reductions in present net value (PNV) or allowable sale quantity (ASQ) involved.

ALTERNATIVE WAYS OF MEETING THE MANAGEMENT REQUIREMENTS

Usually there is more than one way in which a management requirement can be met, i.e., different means (or ways) can be analyzed for assuring the specifications that indicate ends are satisfied or met. The specifications involve choices as well as the means for achieving those specifications to meet the same end. Considering and analyzing different means (or ways) of meeting a specific management requirement are particularly important if there are potentially large opportunity costs involved.

HOW IMPLEMENTATION METHODS TO MEET THE MANAGEMENT REQUIREMENTS ARE DEVELOPED

The general process used in evaluating alternative ways of meeting the management requirements is as follows:

1. Identify the desired “end” for each management requirement.
2. Assemble existing information about the resources addressed by the management requirement.
3. Analyze the existing information to determine what conditions or specifications need to exist on-the-ground to assure meeting “ends” of the management requirement. See Table I-1.
4. Develop various ways or means to meet the management requirement. See Table I-2.
5. Evaluate the effectiveness of the alternative means in meeting the management requirements. Estimate the environmental effects of each set of means.
6. For each set of means, estimate the effects on economic efficiency (as measured by changes in present net value) and the effects on timber availability (as measured by allowable sale quantity).

7. Where opportunity costs of meeting a management requirement exceed two percent of PNV or ASQ of the maximum present net value benchmark, the analysis used to select the means is presented in this appendix. Two percent was used as a threshold because differences less than two percent would not be significant in terms of opportunity costs of alternative means. A higher threshold would preclude evaluation of many alternatives.

Table I-1 summarizes each of the management requirements (ends) subject to analysis of opportunity costs on the Wenatchee National Forest and summarizes the specifications or standards of achievement for those ends.

TABLE I-1

**SUMMARY OF MANAGEMENT REQUIREMENTS
AND ASSOCIATED SPECIFICATIONS**

MANAGEMENT REQUIREMENTS	SUMMARY OF SPECIFICATIONS
1. Openings created by timber harvest activities are dispersed and limited in size.	<ul style="list-style-type: none"> - maximum created opening size of 40 acres (with some exceptions). -created openings cannot be adjacent to, or corner on, another created opening within a given 10 year period or decade. -site must be adequately stocked with trees 4 1/2 feet tall before a harvest area is considered a closed stand and not an opening. -large private cutting areas will be compensated for or ignored for this modeling effort.
2.Habitat provided that maintains viable populations of existing native and desired non-native vertebrate species.	<ul style="list-style-type: none"> - Pileated woodpecker, pine marten Northern three-toed woodpecker -maintain old growth or mature conifer habitat (nesting habitat) and feeding areas of adequate size and distribution to permit interaction among breeding pairs of dependent species. (See Table I-6, I-7, I-8). - Spotted owl -maintain old growth or mature conifer habitat (nesting habitat and feeding areas) of adequate size and distribution to permit interaction among breeding pairs of dependent species. (See Table I-9).
3.Protect water quality and edges of all perennial streams, lakes, and other bodies of water require special attention:	-land approximately 100 feet from riparian habitat.
<ul style="list-style-type: none"> 1. to maintain streambank stability. 2. to maintain stream channel stability. 3 to avoid unacceptable erosion and sedimentation that would exceed State standards. 4. to meet Clean Water Act standards 5. to meet State water quality standards. 	

Table I-2 shows the alternative means considered for implementing each management requirement where the opportunity costs exceeded 2 percent of the present net value or the allowable sale quantity of the Maximum Present Net Value Benchmark.

TABLE I-2

SUMMARY OF ALTERNATIVE MEANS CONSIDERED FOR IMPLEMENTING EACH MANAGEMENT REQUIREMENT

MANAGEMENT REQUIREMENT	ALTERNATIVE MEANS
Harvest Dispersion	<ol style="list-style-type: none"> 1. 25% of any analysis unit (Created openings) harvested in one decade. 2. 20% of any analysis unit harvested in one decade; all adjacent private lands harvested in first decade. 3. 33% of any analysis unit harvested in one decade; 50% of adjacent private lands cut; created openings may corner on each other.
Provide for adequate old growth/mature habitat to maintain viable populations of wildlife (pileated woodpecker, marten/three-toed woodpecker)	<ol style="list-style-type: none"> 1. Dedicate old growth habitat with no timber management 2. Manage old growth habitat which provides for replacement habitat. 3. Manage mature habitat which provides for replacement habitat.
Provide for adequate old growth/mature populations of wildlife (spotted owls).	<ol style="list-style-type: none"> 1. Dedicate old growth/mature habitat to maintain viable habitat with no timber management. 2. Manage old growth habitat which provides for replacement habitat.
Protect water quality and riparian habitat.	<ol style="list-style-type: none"> 1. Manage riparian-aquatic zone on extended rotation. 2. Dedicate riparian-aquatic zone with no timber management.

In analyzing the effects of the alternative means of meeting the MR's on present net value (PNV) and allowable sale quantity (ASQ), FORPLAN runs were made with and without constraints designed to simulate meeting the management requirement. The Maximum PNV benchmark was used for this analysis. This benchmark is a FORPLAN run which identifies the mix of management activities which would result in the highest level of economic efficiency (i.e., the highest PNV) in managing the Wenatchee National Forest resources. It also identifies the ASQ associated with the most economically-efficient mix of management activities.

A benchmark was chosen to use in the with and without constraint comparison, rather than an issue-based Forest Plan alternative, because management practices necessary to meet other objectives of the issue-based alternatives may partially or fully meet the MR, thus clouding any analysis of opportunity costs induced by the management requirement. The true effect when measured against a fully developed alternative is significantly less because the objectives of that alternative may satisfy the management requirements to a large extent.

Table I-3 summarizes the findings of the analysis. It displays the PNV and the first-decade ASQ for the maximum PNV benchmark as shown in the DEIS and shows the reduction in PNV and ASQ resulting from application of the selected optimum means of meeting the management requirements. Also displayed is the percent change in ASQ and PNV.

Where the opportunity costs exceeded 2 percent, the analysis of the alternative means for meeting management requirements is presented in subsequent tables.

The following sections present for the management requirements requiring a discussion of the alternatives: (1) the source of the management requirement; (2) a description of the management requirement; (3) alternative ways considered for meeting the management requirement; (4) an opportunity cost analysis; (5) consequences of the different ways of meeting each management requirement; (6) rationale for the selected method; (7) implications for Forest Plan alternatives; and (8) a discussion of the role of monitoring and research.

TIMBER HARVEST DISPERSION

SOURCE OF THE MANAGEMENT REQUIREMENT

Direction for harvest dispersion comes from several sources. The National Forest Management Act (Section 6 (g)(3)(F)) sets broad direction that the Forest Service is to, among other things, identify maximum sizes for openings created by harvest activities (created openings). This is further defined in the NFMA implementing regulations (36 CFR 219.27(d)) and in the Regional Guide for the Pacific Northwest Region (pages 3-7 and 3-8).

DESCRIPTION OF THE MANAGEMENT REQUIREMENT

The specifications or standards for achievement of the harvest dispersion management requirement are:

1. A harvested area of commercial forest land will no longer be considered a created opening, for silvicultural purposes, when stocking surveys, carried out in accordance with Regional instructions, indicate prescribed tree stocking that is at least 4 1/2 feet high and free to grow.
2. The maximum size limit of harvest openings on the Wenatchee National Forest is 40 acres. Some exceptions are permitted in specific situations.
3. Harvest openings will be separated by blocks of land that generally are adequately stocked with trees that are at least 4 1/2 feet high and that contain one or more logical harvest units.
4. Created openings cannot be adjacent to, or corner on, another created opening within a given 10 year period or decade. However, they can be adjacent after 10 years.
5. Large private cutting areas will be compensated for or ignored for this modeling effort.
6. Harvest openings should not be created adjacent to any natural openings (regardless of size) unless adequate vegetation along the edge of the natural opening can be developed or retained in sufficient density to protect wildlife and meet visual management objectives.

ALTERNATIVE WAYS CONSIDERED FOR MEETING THE MANAGEMENT REQUIREMENT

The Wenatchee National Forest based its analysis of the dispersion MR on the time required to harvest an entire area. The schematic representation of the assumptions used in the draft Wenatchee Forest Plan (25% dispersion) is shown below (Figure I-1). The numbers in the boxes represent schematic 40 acre cutting areas. Areas numbered “1” would be cut in the first decade, “2” in the second decade, “3” in the third decade, and “4” would be cut in the fourth decade. If it takes 40 years to harvest the entire analysis area, then prorating this out would allow 25% to be harvested in each decade.

FIGURE I-1

	1	2	1	2
	3	4	3	4
DECADES	1	2	1	2
1990 = 1				
2000 = 2				
2010 = 3				
2020 = 4				

Dispersion Limitation: (Fig. I-1) This is the constraint used in the DEIS where no more than 25% of any analysis unit can be harvested in any one decade.

A second modeling assumption considered was that adjacent analysis areas were all harvested in the first decade, as could be the case with intermingled ownership patterns in mature timber areas.

Changing this one assumption from the previous example, where cutting adjacent to an analysis area was ignored or compensated for, could result in a 5 decade period to harvest an entire analysis area. This results in a 20% dispersion constraint (Figure I-2).

FIGURE I-2

DECADES

1990 = 1
2000 = 2
2010 = 3
2020 = 4
2030 = 5

3	2	3	2
4	1	4	5
3	2	3	2
4	5	4	5

Dispersion Limitation: (Fig. I-2) This is the worst case scenario where no more than 20% of any analysis area can be harvested in any one decade and all adjacent private lands are harvested in the first decade.

A less restrictive assumption would result if created openings can corner on, or be adjacent to each other, but not have a lot of area in common. In this third schematic, some adjacent harvest or created opening is recognized outside of the analysis area, but it is assumed this would not exceed 50% of the adjacent area. This would result in an approximately 33% dispersion constraint.

FIGURE I-3

2	1	2	1
1	2	1	2
2	3	2	3

Dispersion Limitation: (Fig. I-3) This is where no more than 33% of any analysis unit can be harvested in any one decade and where it is assumed that created openings on adjacent private lands would not exceed 50%.

OPPORTUNITY COST ANALYSIS

Table I-4 displays the opportunity costs associated with the two sets of alternative analysis assumptions considered in detail for meeting the timber harvest dispersion management requirement.

The reduction in PNV per unit loss of ASQ in meeting the harvest dispersion MR is disproportionately high as compared the effects of the other MR's on PNV. This occurs because the lower ASQ is not accompanied by a corresponding reduction in management costs. In fact, some management costs may actually increase with implementation of harvest dispersion requirements. For example, to meet the harvest dispersion management requirement, it may be necessary to accelerate development of roadless areas (resulting in additional road development costs), delay harvest of high-value timber on some lands, or use faster (and more expensive) reforestation methods to reduce the length of time that an area is considered a created opening.

TABLE I-4

**APPROXIMATE CHANGE (OPPORTUNITY COST)
ASSOCIATED WITH MEETING THE HARVEST DISPERSION
MANAGEMENT REQUIREMENT**

Opportunity Cost of Meeting the Harvest Dispersion Management Requirement With All Adjacent Analysis Areas Harvested in First Decade (20% Dispersion)	4.9 (26.9)	16.4%	31	1.5%
Opportunity Cost of Meeting the Harvest Dispersion Management Requirement With Less Than 50% Adjacent Analysis Areas Harvested and Corners Touching (33% Dispersion)	3.8 (20.7)	12.7%	19	0.9%

MMCF/YR = Millions of cubic feet per year

MMBF/YR = Millions of board feet per year

MM\$ = Millions of dollars

1/ Percent change calculated on cubic foot basis

CONSEQUENCES OF THE ALTERNATIVE WAYS OF MEETING THE MR

In general, the risk to other resources is expected to be less when the dispersion factor is more constraining. More risk to other resources is expected when the dispersion factor is less constraining. Specifically, when the dispersion factor is relaxed (more of an area can be cut): the risk of having fewer animal species would slightly increase; there would be a slightly increased risk of unacceptable modification to the visual resource; and regeneration potential could be slightly less. When the dispersion factor is more constraining, the opposite (less risk) would be expected. Watershed conditions are unaffected.

RATIONALE FOR THE SELECTED IMPLEMENTATION MEANS

The 25% dispersion factor was selected as the maximum rate at which regeneration cutting could occur without cut areas touching. This is assuming a checkerboard harvesting model.

A check of plantations on the Forest found a range of 8 to 16 years for trees to reach 4.5 feet in height with an average period being 13.2 years. A diagram of the harvesting scheme that would meet the 25% dispersion constraint is shown in Figure I-1.

The rationale resulting in a 20% dispersion limitation would be the exceptional case and not applicable for a Forest average. It would create an unnecessarily large reduction in ASQ and PNV. The rationale allowing harvest areas to corner is contrary to our understanding of regional direction that says openings which touch or corner must be considered one opening.

IMPLICATIONS FOR FOREST PLAN ALTERNATIVES

The dispersion management requirement is most critical for those alternatives that have the highest ASQ. It also is a major factor in areas of heavy private cutting.

The opportunity costs from the dispersion management requirement would be less than the PNV benchmark because the objectives of most alternatives contribute to satisfying the MR. For example, allocations for wildlife habitat or scenery would be more restrictive on timber harvest than the dispersion MR.

Under the preferred alternative, some delay of harvest in checkerboard ownership areas will be required, especially on the Cle Elum and Naches Ranger Districts. This will necessitate additional harvest in areas which require more road construction which will reduce the PNV.

ROLE OF MONITORING AND RESEARCH

Monitoring and research are needed to assess where dispersion of harvest is actually benefitting water and wildlife, and where concentrations of cutting may be desirable. Some research people propose that fewer large openings might have less impact on ecosystems than the dispersal of many small openings over a wider area.

VIALE POPULATIONS OF EXISTING NATIVE VERTEBRATE SPECIES

Source of the Management Requirement

The NFMA regulations require that:

“Fish and wildlife habitat shall be managed to maintain viable populations of existing native and desired nonnative vertebrate species in the planning area. For planning purposes, a viable population shall be regarded as one which has the estimated numbers and distribution of reproductive individuals to insure continued existence in the planning area. In order to insure that viable populations will be maintained, habitat must be provided to support, at least, a minimum number of reproductive individuals and that habitat must be well distributed so that those individuals can interact with others in the planning area.” (36 CFR 219.19).

Vertebrate species in Region 6 were assessed with regard to population numbers and/or distribution that could result in either Forest or Regional extinction during the next five decades. Management requirements were developed for species whose viability would be at risk if no management actions were taken to protect their habitats.

The focus was on habitats that were likely to be limiting in the future (in short supply either in total acreage or in distribution). There was also an identification of particular species that could be used to represent all species dependent on those habitats. This identification was done on a subregional basis, recognizing the variability of situations within the Region. Once these species were identified, the Region defined their habitat requirements and biological characteristics. The species are included in the list of Management Indicator Species that the Forests address in forest planning and subsequent monitoring.

Table I-5 displays current Regional management requirement direction regarding limited habitats and wildlife species by sub-regional zones. The Wenatchee National Forest is in Zone 3, East Cascades.

Northern spotted owl, pileated woodpecker, three-toed woodpecker, and marten are the only species for which alternative ways of meeting management requirements are evaluated. Management requirements for mountain goat, primary cavity excavators, threatened and endangered species, sensitive species (except spotted owl), and special habitats are not addressed in this analysis because opportunity costs associated with providing sufficient habitat to maintain viable populations are less than two percent. The management requirements for riparian wildlife and fish are met with the same management practices which provide the requirements for water quality and riparian area management, therefore, further analysis is not provided.

TABLE I-5

**SPECIES MATRIX FOR ADDRESSING MANAGEMENT REQUIREMENTS
FOR WILDLIFE AND THREATENED AND ENDANGERED SPECIES**

T & E Species	Bald Eagle Peregrine Falcon Brown Pelican Aleutian Canada Goose	Bald Eagle Peregrine Falcon	Bald Eagle Peregrine Falcon Grizzly Bear Woodland Caribou (Colville)	Bald Eagle Peregrine Falcon

HABITAT NEEDS

Once the species needing management requirements were identified, the Region defined habitat requirements and biological characteristics. These are the basis for providing habitat and also for deciding how best to represent the species' needs in the planning process and in the FORPLAN Model.

Habitat needs were defined using information from existing research whenever possible (see bibliography). This information was used to define the habitat conditions, habitat dispersal, and habitat size necessary to meet the management requirement. When information was available, but did not fit exactly the management requirement context, professional judgement was used to apply the information in estimating habitat needs. When information was not available, habitat needs were developed using professional judgment of a number of the more knowledgeable biologists on the subject. Information from existing research was used whenever possible. (Note: Habitat needs of spotted owls are described in the Final Supplement to the Environmental Impact Statement for an Amendment to the Pacific Northwest Regional Guide).

Specific information on habitat needs, specifications for meeting habitat requirements, and alternative ways of meeting the management requirements for marten, pileated woodpecker, and spotted owls are presented in the following sections. For each species, information is provided for these three habitat factors:

(1) Principal Habitats Used - Information about the seral stages and Kuchler vegetation types which are used by the various species is documented in many research papers for individual species. Information as to which Kuchler type and/or seral stage are primary or secondary habitat, and the amount of dependency upon each habitat, is based mostly on professional judgment. (Guenther and Kucera 1978, Phillips et al., 1981)

(2) Dispersal Distance Between Habitats - The guideline on distribution of habitat areas is intended to establish a network that allows individuals of a species to successfully disperse to adjacent habitat areas. This provides interactions among individuals and prevents isolation of sub-populations. This guideline is called the dispersal distance. Research information alone is generally not adequate to establish reasonable dispersal distances between habitats. As a result, dispersal distance is often determined on the basis of observations, experience, and professional judgement. In establishing the network of habitat areas for each species, consideration is given to habitats in reserved areas and to habitat areas being established for other species.

(3) Size of Area to which Wildlife Prescriptions Apply - The size of individual habitat areas provided for each wildlife species is based on the habitat acreage needed to support the basic social or reproductive unit of the species, i.e., breeding pairs. Both home range and species density information are used to estimate the needed size of habitat area. This was supplemented with professional judgement where no data were available for the specific habitat types being managed.

The specific Regional direction for the three identified indicator species and the scientific source of that direction are discussed in the following sections. This direction is summarized from "A Report on Minimum Management Requirements for Forest Planning on the National Forests of the Pacific Northwest Region, USDA Forest Service" (USDA Forest Service, June 1986). In developing the report, various habitat sizes and dispersal distances were considered. Based on that analysis minimum habitat sizes and maximum dispersal distances were identified for each species. Since those minimums are based on the best available data, and there are no data specific to the Wenatchee area which would indicate different habitat needs, alternate minimums were not further considered in developing the Forest Plan for the Wenatchee National Forest.

SPECIFICATIONS FOR MEETING HABITAT REQUIREMENTS FOR PILEATED WOODPECKER, NORTHERN THREE-TOED WOODPECKER, AND PINE MARTEN

Approximately 40-50 wildlife species are known to depend on or prefer mature conifer habitat during some part of their life cycle on the Wenatchee National Forest. By providing a dispersion of mature conifer habitats sites for the pileated woodpecker, northern three-toed woodpecker and pine marten, we are assuming that the other species preferring mature conifer habitats will have adequate habitat to maintain viable populations throughout the planning period.

Regional specifications for pileated woodpecker, northern three-toed woodpecker and pine marten are discussed in the following sections. The specifications are summarized from "A Report on Minimum Management Requirements for Forest Planning on the National Forests of the Pacific Northwest Region, USDA Forest Service" (USDA Forest Service, June 1986). In developing the report, various habitat sizes and dispersal distances were considered. Based on that analysis, minimum habitat sizes and maximum dispersal distances were identified for each species.

Pileated Woodpecker

Principal Habitats Used - Pileated woodpeckers need mature and old growth stands of timber for nesting and feeding. Habitats listed were identified in Bull and Meslow (1977), Guenther et al. (1978), and Thomas (1979).

Dispersal Distance Between Habitats - An initial five-mile maximum dispersal distance between habitats resulted from professional judgement documented in Phillips and Roberts (1985). In June 1986, the distance between habitats was modified to one habitat areas for every 12,000 to 13,000 acres (about five miles apart) to allow greater flexibility in application. Irwin (1987) suggested that this distance could be greater, but also noted that dispersal distances of juvenile pileated woodpeckers are poorly known. He offered no concrete alternative to the five-mile distance. Bull (1987) noted that the distance moved by eight juveniles from the nest where they were raised to the territory that they later occupied ranged from 0.4 to 5.4 miles and averaged 2.1 miles.

Size of Area to Which Wildlife Prescriptions Apply - The size of areas used by pairs of pileated woodpeckers during the nesting season has been observed to range from 320 acres in eastern Oregon to 1,357 acres in western Oregon (Irwin, 1987). The management requirement established for pileated woodpeckers both east and west of the Cascades called for 300 acres of old growth or mature timber, containing at least 45 snags greater than 20 inches, plus 300 acres of feeding area. The requirement for 300 acres containing at least 45 large snags was taken from Thomas (1979). The additional requirement for 300 acres of small snags for foraging areas was established because of the evidence from the literature that pairs of pileated woodpeckers used areas larger than 300 acres. Acreage figures from Bull (1975), and Bull and Meslow (1977) were used. As more data specific to westside and eastside habitats (eastside may be further subdivided) become available, the size of the nesting area may be adjusted.

**TABLE I-6
WILDLIFE SPECIES HABITAT REQUIREMENTS**

SPECIES PILEATED WOODPECKER

<u>Principal Habitats Used</u>	<u>Dispersal Distance Between Habitats</u>	<u>Size of Area to which Wildlife Prescriptions Apply</u>	<u>Habitat Requirements to be Used In Analyses</u>
Zone III (East Cascades)	All Zones	600 acres/pair	Within a 1,000 acre unit.
A.Reproducing			
Seral stages V and VI of Kuchler types K1, K2, K3, K5, K7, K10, K11, K12, K13, K14 and riparian	One habitat area for every 12,000 to 13,000 acres'		- Maintain 300 acres of conifers in seral stages VI and/or V, per pair for reproducing.
B.Feeding			
All seral stages of Kuchler types listed for reproducing habitat, provided snags are present.			- Maintain a minimum average of 2 hard snags per acre greater than or equal to 12 inches DBH, within the 300 acre reproductive area. Forty-two of these 600 snags should be greater than or equal to 20 inches DBH. -When possible, maintain reproductive area in 300 contiguous acres. If not possible, habitat may be arranged in blocks no less than 50 acres and no more than 1/4 mile apart - Maintain a minimum average of 2 hard snags per acre greater than or equal to 10 inches DBH on an additional 300 acres for feeding.

Northern Three-Toed Woodpecker

Principal Habitats Used - The three-toed woodpecker represents mature and old growth seral stages.

Dispersal Distance Between Habitats - The 2 mile dispersal distance between habitats was the result of professional judgment documented in Phillips and Roberts (1985). In June 1986, this direction was modified to allow one habitat for every 2,000 to 2,500 acres (the area of a circle whose diameter is 2 miles), to allow greater flexibility in application.

Size of Area to Which Wildlife Prescriptions Apply - The size of the area is 75 acres per pair and was taken from Thomas (1979).

SPECIES NORTHERN THREE-TOED WOODPECKER

Principal Habitats Used	Dispersal Distance Between Habitats	Size of Area to which Wildlife Prescriptions Apply	Habitat Requirements to be Used in Analyses
A. Reproducing Seral stage V and VI of Kuchler types K4, K15, and lodgepole pine.	One habitat area for every 2,000 to 2,500 acres.	75 acres per pair	Maintain 75 acres of conifers in seral stages VI and/or V, per pair for reproducing
B. Feeding All seral stages of Kuchler types K4, K15, and lodgepole pine, provided snags are present.			Maintain a minimum average of two hard snags per acre greater than or equal to 10 inches DBH, within 75 acre reproductive areas. Forty-five of these 150 snags should be greater than or equal to 12 inches DBH.

Pine Marten

Principal Habitats Used - The marten uses seral stages III-VI--closed sapling-pole, large mature, and old growth (Thomas, 1979; Guenther and Kucera, 1978; Phillips and others, 1981). The Kuchler types used are from Guenther and Kucera (1978). The principal habitat for the marten is seral stages V and VI (mature and growth).

Dispersal Distance Between Habitats - Burke (1982) recommends that the dispersal distance between habitat areas for marten should be two miles. This change was made because it was felt where than one adjacent habitat is available for dispersal, the dispersal distance can be extended to three miles for pine marten. This change has been reviewed by a number of biologists within and outside the Forest Service and most agree that it would appear not to create a population viability problem for represented species. In June of 1986, the dispersal distance specification for marten habitat was changed to one habitat for every 4,000 to 5,000 acres (about 3 miles apart), to allow greater flexibility in application.

Juvenile marten dispersal up to 25 miles has been observed (Hawley and Newby, 1957), and average juvenile dispersal distances greater than 6 miles were observed in these studies and Burnett (1981). Based on this information, Irwin (1987) concluded that "the dispersal distance used in the MMR standards might be increased without reducing probabilities for interactions among adults or dispersing young". However, he did not provide a specific alternative, and concluded that there was little empirical insight into the probability of maintaining a viable marten population using the MR guidelines. As Burke (1982) noted, the distance covered by dispersing individuals is not an absolute guide to appropriate spacing between habitat areas. The probability of dispersing individuals location habitat areas and other individuals decreases rapidly as habitat areas are spaced further apart. Burke suggested that the observed range of population densities might be a better guide to spacing of habitat areas. He noted that the three mile spacing would result in a marten density 1/9 to 1/27 of normal densities reported in the literature.

Size of Area to Which Wildlife Prescriptions Apply--In the professional judgement of the biologists listed in Phillips and Roberts (1985), a breeding female pine marten can be supported on 160 acres of quality habitat. Research is variable as to the size of area needed, but the female pine marten home range is estimated to be 160 acres (Campbell, 1978). The biologists listed in Phillips and Roberts (1985) judged that this area should be contiguous to ensure that there would be enough habitat within the home range of the female. They also judged that crown closure should equal or exceed fifty percent. Research papers indicate that areas with a low percent crown closure receive little or no use by pine marten. Therefore, to ensure and adequate crown closure, a minimum requirement of 50 percent closure was selected.

Research shows that pine marten require dead and down material for foraging, cover, and denning,. Six down logs/acre (Burke, 1982) was selected as the minimum down material requirement. The number and size of snags required was selected to ensure that the amount of down material was achieved. The specifications for pine marten habitat are summarized in Table I-8.

Irwin (1987) noted that the MR guidelines contained an implied hypothesis that 160-acre areas would meet reproductive and winter range needs, and that marten would use broader areas containing a mix of less suitable habitat types at other times. He concluded that monitoring and research could provide appropriate tests of this hypothesis.

TABLE I-8

WILDLIFE SPECIES HABITAT REQUIREMENTS

SPECIES MARTEN

Principal Habitats Used	Dispersal Distance Between Habitats	Size of Area to which Wildlife Prescriptions Apply	Habitat Requirements to be Used in Analyses
Zones III and IV			
A. Reproducing			
Seral stages V and VI of Kuchler Types K4, K12, K13, K14, K15 and lodgepole climax.	One habitat area for every 4,000 to 5,000 acres.	160 acres per habitat area. (This figure represents the territory of one female and part of the territory for a male.)	Maintain 160 contiguous acres of conifers in seral state V or VI with a crown closure of 50% or greater.
B. Feeding			
Seral stages III-VI of Kuchler Types K4, K11, K12, K13, K14, K15 and lodgepole climax.			Maintain an average of 2 hard snags per acre greater than or equal to 12 inches DBH. Twenty-four of these 320 snags should be greater than or equal to 20.

ALTERNATIVE WAYS CONSIDERED FOR MEETING THE MANAGEMENT REQUIREMENT

Application of the Regional direction for size and dispersal of habitats to the Wenatchee National Forest requires that a minimum of 52,000 acres of mature/old-growth forest, outside of wilderness or other lands not suitable for timber production, be retained as wildlife habitat for the indicator species and other species occupying the same habitat. In this analysis, habitat requirements for the three species are not considered separately since all species require the same type of habitat, though in differing amounts. In order to reduce the total amount of old growth/mature forest necessary to provide for viable populations, every opportunity was taken to overlap areas managed for the indicator species, i.e., a habitat area for a pileated woodpecker is also suitable for a marten and for a northern three-toed woodpecker. Areas for marten and three-toed woodpecker have been combined into one instead of having a separate area for each species. Consequently, opportunity costs for one species cannot reasonably be considered separately from the other two.

In the DEIS, the Wenatchee elected to provide old-growth habitat by managing for old-growth conditions on a long rotation (260 years). For the pileated woodpecker, this meant maintaining 600 acres in 130-260 year old stands with 600 acres in 1-130 year old stands. The marten/northern three-toed woodpecker had stands of 160 acres with trees 1-260 years old and a select number of trees 130-260 years old. Either of these two prescriptions could be used for the pileated woodpecker and marten/northern three-toed woodpecker.

An alternative way of providing the habitat would be to dedicate the old growth. Under a dedicated old growth strategy, each acre of old growth is withdrawn from timber production. Dedication of existing old-growth stands assures that desired structural characteristics will be available for wildlife. It risks the loss of individual stands through catastrophic events or natural decay of the system. Recent literature on old growth however, suggests that such risk is much less than once thought. Indeed, management of old growth on a harvest basis and replacing it removes structural characteristics important to old growth and may hasten the decline of the residual stand (Franklin 1981).

In the managed strategy for the pileated woodpecker, the direction was to provide replacement stands through time. The old growth component of the habitat area would remain unlogged until a replacement stand achieved mature habitat conditions. Then the old growth stand would be logged while the mature stand developed into an old growth condition. This strategy requires twice as many acres as the dedicated strategy but reduces the risk from catastrophic events by having a larger area. It also reduces the stand replacement time; if natural systems of decay removed the old growth, the mature stand would already be developing into old-growth habitat.

For the marten/northern three-toed woodpecker areas, only one stand was maintained. This stand would be logged frequently to remove defective trees and keep the stand healthy. Maintaining a healthy stand of trees with little defect does not allow dead standing or dead down trees to occur in the abundance desired without additional costs and management. Frequent logging of a stand requires removal of dead trees that are in the later stages of decay to maintain safe conditions for loggers. As a result, the limiting factor for the marten/three-toed woodpecker may be the dead and defective tree structure. The cumulative effect of multiple entries into the stand for logging may mean the loss of the area from the old growth network with no further cutting until the area recovered to satisfactory conditions.

ANALYSIS OF OPPORTUNITY COSTS

Table I-9 displays the opportunity costs associated with the three ways of meeting the viable wildlife populations management requirement. Present net value for the managed old growth methods is not displayed since opportunity costs were calculated by means other than the FORPLAN model.

CONSEQUENCES OF THE DIFFERENT WAYS OF MEETING THE MANAGEMENT REQUIREMENTS

The Wenatchee National Forest is providing a minimum number of sites, with a minimum acreage per site, in the areas where timber harvest may occur. If problems occur in “key” sites or in a number of adjacent sites, there is a risk of dividing the existing network into two or more populations. There is a high likelihood of this fragmentation of the old growth network occurring. This is due to:

1. Minimum acreage per site;
2. Minimum distribution (number of sites);
3. High risk management prescription;
4. High rate of catastrophic events (fire);
5. Low knowledge on the requirements of wildlife species;
6. Lack of good field information on habitat sites; and
7. Lack of indicator species inventories.

This document only discusses the prescription to be applied. A change in the prescription will increase or decrease the risk of maintaining one population, but the risk is changed only a small amount.

MMCF/YR = Millions of cubic feet per year
MMBF/YR = Millions of board feet per year
MM\$ = Millions of dollars
1/ Percent change calculated on cubic foot basis

RATIONALE FOR THE SELECTED METHOD

Based on the preceding analysis, it was determined that for the Wenatchee situation having 40% of the pileated woodpecker and marten/three-toed woodpecker in Wilderness with low risks for maintaining habitat would balance the high risk in timber harvest areas. The populations in Wilderness are related to habitat on the Gifford Pinchot, Mt. Baker-Snoqualmie and Okanogan National Forests, and Mt. Rainier and North Cascades National Parks. This additional habitat represents a large number of individuals. Therefore, the total risk to the populations of these species is low. The goal is to maintain sufficient mature habitat and distribution which can be replaced quickly with minimal effects on timber harvest. Different management prescriptions were selected for each species to have the least effect on timber harvest. Fragmentation of the populations was not part of the considerations for selection of the prescription.

IMPLICATIONS FOR FOREST PLAN ALTERNATIVES

Plan alternatives were designed to address public issues. Therefore, alternatives incorporate retention of mature and old growth habitat for a variety of objectives such as wildlife, visual, riparian, recreation, and wilderness. Where marten/northern 3-toed woodpecker and pileated woodpecker areas overlap these other allocations, they would be managed for other resource objectives whose constraints on vegetation management are more binding than the mature habitat management requirements. The opportunity costs for this situation are thus a result of the allocations, rather than the management requirements of the marten/northern 3-toed woodpeckers and pileated woodpeckers. Since each Forest Plan alternative has different allocations of resources, the costs of the MR are different. How much of the mature/old growth component is in managed or dedicated strategies will also change by alternative.

ROLE OF MONITORING AND RESEARCH

The Forest Monitoring Plan (Forest Plan Chapter 5) calls for monitoring populations and habitats of pileated woodpeckers and marten/northern 3-toed woodpeckers. In future planning efforts this data will be considered in determining the suitability and effectiveness of the selected way for meeting the management requirement for viable populations. This is important in testing the appropriateness of the selected modeling assumptions.

NORTHERN SPOTTED OWL

Specific Regional direction for the northern spotted owl is found in the Final Supplement to the Environmental Impact Statement for an Amendment to the Pacific Northwest Regional Guide released in August, 1988. The Supplement was prepared, in response to an appeal of the R-6 Regional Guide, to address planning direction for spotted owl habitat management. Standards and guidelines adopted as a result of the Supplement will be used by National Forests in the Region to meet the management requirement to maintain viable populations of spotted owls.

The Final Supplement was prepared after a series of public meetings and study of the nearly 42,000 comments received on the Draft Supplement issued in the summer of 1986. A summary of the analysis of public comments, substantive comments, and copies of letters received from government agencies and elected officials can be found in Appendix G of the Final Supplement.

The Forest Service selected alternative designates SOHA's to contain a variable amount of suitable habitat by physiographic province based on location of owl pairs and location of habitat in lands unsuitable for timber production. Current distribution of habitat on lands unsuitable for timber production is evaluated for adequacy of distribution. Areas are then designated on lands suitable for timber production if they are needed to meet distribution standards.

Standards and guidelines for the selected alternative are briefly summarized in the following discussion. Chapter 2 of the Final Supplement should be reviewed for a detailed description of the direction. These Regional standards and guidelines will provide specifications or standards for achievement of management requirements for northern spotted owls.

1. **Amount of suitable habitat in designated habitat areas:** Designated habitat areas shall contain the following amount of suitable habitat in the Washington Cascades physiographic province: 2200 acres, 2.1 miles from nest. Habitat shall occur as one contiguous stand if possible or, as a 300-acre stand containing the known or suspected nest site with the remaining habitat as contiguous as possible. Each stand shall be larger than 60 acres.
2. **Spacing of Designated Habitat Areas:** Designate habitat areas where: greater than 6 miles separates areas which occur in reserved lands or in lands unsuited for timber production, and which are capable of supporting less than three breeding pairs of spotted owls; or where greater than 12 miles separates such areas capable of supporting a cluster of three or more habitat areas.
3. **Location of Designated Habitat Areas:** Lands suitable for timber production will be used in designated habitat areas only when needed to meet spacing standards.
4. **Priority for Locating Designated Areas:** Priority for locating designated areas follows status of occupancy by spotted owls: highest priority to locations with verified occupancy by breeding spotted owl pairs within the last 5 years; next highest priority to locations with verified occupancy by breeding pairs more than 5 years ago; next priority to locations with verified occupancy by pairs, either verified non-breeding or breeding status or success unknown; next highest to locations with confirmed sightings of owls; lowest priority to locations where only the suitability or potential suitability of habitat is known.
5. **Management of Habitat:** Habitat can be managed through prescriptions for no scheduled timber harvest or through prescriptions for uneven or even-aged harvest under an extended rotation to meet the standard for amount of suitable habitat within the area. Prescriptions to be used and where they will apply shall be specified in the Forest Plans.
6. **Identification of Suitable Habitat:** Suitable habitat shall be identified in Forest Plans according to the general definition in the spotted owl Final Supplement and with concurrence by the Regional Forester.

ALTERNATIVE WAYS OF MEETING THE MANAGEMENT REQUIREMENT

The Forest considered two ways or means for providing spotted owl habitat. One was to dedicate the required number of acres of suitable habitat in each site. These areas would not be managed for timber production and would be expected to remain in suitable habitat over time. The second method is to manage the habitat on a long rotation such that there is always enough suitable spotted owl habitat at any given time.

- ALTERNATIVE 1: DEDICATED SITES

Under a dedicated habitat strategy, each acre of spotted owl habitat is withdrawn from timber production. Dedication of existing stands assures that desired structural characteristics will be available, but may risk loss of individual stands through catastrophic events or natural decay processes. Recent literature on old growth suggests this risk is much less than once thought. Each spotted owl habitat area is 2,200 acres dedicated under this alternative.

- ALTERNATIVE 2: MANAGED SITES

Management of sites assumes that existing old growth stands can be harvested as other stands grow into an old growth condition to replace them. Delay in harvesting the existing old growth stands would occur if replacement stands fail to develop desired structural characteristics on schedule. Management of old growth on a harvest basis removes structural characteristics important to old growth and may hasten the decline of the residual stand (Franklin 1981). Each spotted owl habitat area is 4,100 acres managed under this alternative.

ANALYSIS OF OPPORTUNITY COSTS

The Final Supplemental Environmental Impact Statement to the Regional Guide (SEIS) for spotted owl habitat management guidelines does not include the number of designated habitat areas as part of any alternative because that will be a consequence of applying standards and guidelines in Forest Plans, rather than being a specification in the Regional Guide.

In preparation of the FEIS for the Wenatchee Forest Plan, the two alternative ways of providing spotted owl habitat were evaluated. With adjustments for overlap on unsuitable lands, 60,000 acres of spotted owl habitat were needed to meet the management requirements discussed in the FEIS.

Table I-10 displays the opportunity costs associated with managing or dedicating spotted owl habitat.

TABLE I-10

OPPORTUNITY COSTS OF ALTERNATIVE WAYS OF MEETING THE SPOTTED OWL MANAGEMENT REQUIREMENT

	FIRST DECADE ALLOWABLE SALE QUANTITY	CHANGE IN ALLOWABLE SALE QUANTITY 1/	PRESENT NET VALUE MM\$	CHANGE IN PRESENT NET VALUE
PNV Benchmark	29.9 (163.0)		2132	
Opportunity Cost--Approximate Change				
Opportunity Cost of Meeting Viable Populations for Spotted Owl by Dedicating Habitat	1.8 (9.8)	6.0%	9	0.4%
Opportunity Cost of Meeting Viable Populations for Spotted Owls by Managing Habitat	1.7 (9.3)	5.7%	9	0.4%

MMCF/YR = Millions of cubic feet per year
MMBF/YR = Millions of board feet per year
MM\$ = Millions of dollars
1/ Percent change calculated on cubic foot basis.

CONSEQUENCES OF THE ALTERNATIVE WAYS OF MEETING THE MANAGEMENT REQUIREMENT

Populations of spotted owls would not be expected to differ significantly under any of the different ways considered to meet the management requirement. There are, however, differences in the opportunity costs (see Table I-10).

RATIONALE FOR THE SELECTED METHOD

In the DEIS, the Wenatchee National Forest chose to provide spotted owl habitat by dedicating 2,200 acre habitat sites.

The dedicated habitat approach has the advantage that the location of the 2,200 acre habitat site does not change over time, making implementation less complicated.

IMPLICATIONS FOR FOREST PLAN ALTERNATIVES

Plan alternatives were designed to address public issues. As a result most alternatives, including the preferred alternative, incorporate objectives for retention of old growth and mature timber for a variety of reasons, including wildlife, visual, and recreational purposes. To the extent possible, spotted owl habitat areas will be overlapped with areas selected for other purposes (such as unroaded recreation areas, special interest areas and other lands determined as not appropriate or unsuited for timber production) wherever these meet habitat suitability and distribution requirements. The analysis of opportunity costs of selected means of spotted owl protection displayed are gross PNV and ASQ effects caused by the selected implementation methods. The costs do not take into account any overlap that may occur among implementation methods where lands selected for spotted owl habitat may also meet other wildlife, scenery or recreation objectives on lands suitable for timber harvest.

ROLE OF MONITORING AND RESEARCH

The Forest Monitoring Plan (Forest Plan Chapter 5) calls for monitoring populations and habitats of spotted owls.

The Final Supplemental Environmental Impact Statement to the Regional Guide (Appendix D) identifies specific monitoring and research needs and describes how the information will be obtained. Intensive inventory, monitoring, and research being conducted by the Spotted Owl Research, Development, and Application Program will provide new information. This should allow an opportunity to re-evaluate and possibly adjust management direction within five years.

WATER QUALITY, RIPARIAN AND FISH MR's

SOURCE OF MANAGEMENT REQUIREMENT

Management requirements for water quality are based on NFMA which states:

Forest planning shall provide for compliance with requirements of the Clean Water Act, the Safe Drinking Water Act, and all substantive and procedural requirements of Federal, State, and local governmental bodies with respect to the provision of public water systems and the disposal of waste water [36 CFR 219.23(d)].

Special attention shall be given to land and vegetation for approximately 100 feet from the edges of all perennial streams, lakes and other bodies of water. This area shall correspond to at least the recognizable area dominated by the riparian vegetation. No management practices causing detrimental changes in water temperature or chemical composition, blockages of water courses, or deposits of sediment shall be permitted within these areas which seriously and adversely affect water conditions or fish habitat [36 CFR 219.27 (e)].

The Clean Water Act seeks to control nonpoint sources of water pollution. To comply with Section 208 of the Act, Forest Service Region Six, the states of Oregon and Washington (which manage implementation of the Act in the respective states), and the Environmental Protection Agency agreed on a process whereby each state reviews Forest Service management practices to determine if they meet or exceed state water quality standards. Practices that are judged to meet or exceed the standards are certified as Best Management Practices (BMPs) which the Forest Service then agrees to continue.

DESCRIPTION OF THE MANAGEMENT REQUIREMENT

General water use and criteria classes are defined by Washington State regulations (WAC 173-201-045). The following criteria shall apply to Class AA (extraordinary) surface waters in the State of Washington. (NOTE: this is a summary of the major items that may be affected by timber harvest activities):

- 1) Freshwater - dissolved oxygen shall exceed 9.5 milligrams/liter.
- 2) Freshwater - temperature shall not exceed 16.0 degrees Celsius due to human activities. When natural conditions exceed 16.0°C., no temperature increase will be allowed which will raise the receiving water temperature by greater than 0.3°C. Temperature increases shall not, at any time, exceed $t=23/(T+5)$. For purposes hereof, "t" represents the permissive temperature change across the dilution zone, and "T" represents the highest existing temperature in this water classification outside of any dilution zone. This is provided that temperature increase resulting from nonpoint source activities shall not exceed 2.8°C., and the maximum water temperature shall not exceed 15.3°C.
- 3) Freshwater - pH shall be within the range of 6.5 to 8.5 with man-caused variation within a range of less than 0.2 units.
- 4) Turbidity shall not exceed 5 NTU over background turbidity when the background turbidity is 50 NTU or less, or have more than a 10 percent increase in turbidity when the background turbidity is more than 50 NTU.

The primary approach to maintaining water quality on Forest lands is to limit or prohibit timber harvest activities on certain unstable land types. The objectives are to minimize sedimentation, blockages and scour in stream channels; to prevent increases in water temperature; to provide a source of large woody debris; and to protect human life.

In the DEIS, the specifications established by the Forest are called standards and guidelines. The Wenatchee National Forest has two kinds of standards and guidelines. The first are Forest-wide standards and guidelines that describe the desired condition to be achieved throughout the Forest in every prescription. Secondly, are those that were written specifically for each prescription. The ones included in the Riparian-Aquatic Habitat Protection Zone (EW-2) prescription are designed to provide additional protection features for the riparian zone that are not covered by the Forest-wide standards and guidelines, as well as provide for some other resource needs (e.g. large woody debris, wildlife cover, etc.).

ALTERNATIVE WAYS CONSIDERED FOR MEETING THE MANAGEMENT REQUIREMENT

The following alternatives were considered:

Alternative 1 - Managed Riparian Zone

This alternative would allow some management of the timber resource through the use of extended shelterwood rotations (approximately 260 years). Leave trees would be concentrated next to the streams which should assure that natural tree mortality will provide the necessary woody debris in the streams. Management practices would require an adequate amount of streamside vegetation for shading to be left so that stream temperatures would remain within acceptable limits.

The EW-2 Riparian-Aquatic Habitat Protection Zone for this alternative would be of variable width. The width would be determined by a combination of potential erosion hazard and the percent slope adjacent to the stream (Forest Plan, p.IV-97). It would also apply to all Class I and II streams along with portions of some Class III streams.

Additional modeling for this alternative included constraints limiting harvest to no more than 25% of any analysis area in a decade as well as allowing harvest in no more than 10% of a riparian zone within any given sub-basin. Class IV streams were also not considered for this prescription.

After a joint meeting with members of the Wenatchee and Okanogan National Forest Interdisciplinary Teams on June 4, 1987, it was decided there was a certain amount of imprecision in determining appropriate inventories and modeling for riparian zones. This imprecision was tested through FORPLAN analysis. The analysis showed that there was not a significant change in the amount of delivered sediment or the amount of runoff produced. Therefore, water quality was not affected.

There was also one other assumption made which is that other management prescriptions would provide adequate protection of the riparian-aquatic zone and therefore did not need a special EW-2 prescription. These other prescriptions include old growth, dispersed unroaded recreation, research natural areas, special interest areas, scenic retention, wilderness, and Wild, Scenic, or Recreational River designations. These allocations overlap riparian zones in a lot of places. Thus the acreage figures for the riparian zone may not reflect the actual total on the forest.

The variable width riparian-aquatic habitat protection zone was developed with the intention of maintaining water quality by keeping sediment out of the streams. It was not designed to meet the needs of wildlife. Generally, the narrowest protection zones are located along the Class I and II streams. In these areas the protection zone may not be wide enough to provide suitable habitat for some species of wildlife.

Alternative 2 - Dedicated Riparian Zones

This alternative would require full protection for the lands within one hundred feet from either side of all Class I, II, and portions of some Class III streams. There would be no timber harvest activities allowed within this zone except for sold sales that have yet to be harvested. Stream temperatures would be adequately protected because none of the streamside vegetation would be removed.

The variable width protection zone, which may go out beyond the designated one hundred foot protection zone, will also require that consideration be given to practices that will prevent unacceptable soil erosion.

This alternative would require that the EW-2 prescription (riparian-aquatic habitat protection zone) be applied to all riparian lands, with the prescription standing on its own. No other prescription would have precedence over EW-2.

OPPORTUNITY COST ANALYSIS

Table I-11 displays the opportunity costs associated with the two sets of alternative analysis means considered in detail for the water quality/riparian management requirement.

TABLE I-11

OPPORTUNITY COSTS OF ALTERNATIVE WAYS OF MEETING THE WATER QUALITY/RIPARIAN MANAGEMENT REQUIREMENT

	FIRST DECADE ALLOWABLE SALE QUANTITY	CHANGE IN ALLOWABLE SALE QUANTITY	PRESENT NET VALUE MM\$ 1/	CHANGE IN PRESENT NET VALUE
Maximum PNV Benchmark as Displayed in the FEIS	29.9 (163.0)		2132	
Opportunity Cost--Approximate Change				
Opportunity Cost of Meeting Management Requirements for Water Quality/Riparian (Managed)	1.8 (9.8)	6.0%	9	0.4%
Opportunity Cost of Meeting Management Requirements for Water Quality/Riparian (Dedicated)	3.0 (16.3)	10.0%	15	0.4%

MMCF/YR = Millions of cubic feet per year

MMBF/YR = Millions of board feet per year

MM\$ = Millions of dollars

1/ Percent change calculated on cubic foot basis.

CONSEQUENCES OF ALTERNATIVE WAYS OF MEETING WATER QUALITY

Implementation of either alternative would meet water quality standards. Alternative 1 was designed specifically to keep delivered sediment at acceptable levels, while still allowing some timber harvest activities to occur within the riparian-aquatic habitat protection zone. Alternative 2 would provide additional protection, so would be more effective in keeping the soils in place and minimizing the amount of delivered sediment that would get into the lakes, streams, and rivers on the Wenatchee National Forest. Alternative 2 would also provide for more large woody debris in and adjacent to the stream channels, as well as providing more habitat for wildlife (e.g. hiding cover, forage, etc.).

RATIONALE FOR THE SELECTED IMPLEMENTATION MEANS

Implementation methods (means) for meeting the management requirements for water quality are based on practices that were developed prior to the needs developed to provide additional protection for wildlife and fish in the riparian-aquatic habitat protection zone. Originally, the emphasis was on reducing the amount of delivered sediment that would enter a stream, river, or lake, and also on shade to prevent wide changes in water temperature.

Alternative 1 represents current practices that have been developed through cooperation between the Forest soil scientist, hydrologists, foresters, biologists, and other professionals. Compliance with the Forest-wide standards and guidelines and the special standards and guidelines included in the EW-2 prescription will result in meeting the Washington State Class AA water quality standards. It will also have less of an impact on the ASQ and PNV than Alternative 2.

IMPLICATIONS FOR FOREST PLAN ALTERNATIVES

The DEIS Chapter II, Appendix B part VIII, and Appendix F, discuss the effects on DEIS alternatives. The analysis of opportunity costs of selected means of water quality protection is displayed in Appendix B part IV (economic efficiency analysis). The costs do not account for overlap among implementation methods where other prescriptions (OG-1, RE-2A, RE-2B, RN-1, SI-1, ST-1, WI-1, WS-1, WS-2, & WS-3) provide equal or better protection for the Riparian-Aquatic Habitat Protection Zone.

ROLE OF MONITORING AND RESEARCH

Determining the width of the variable-width protection zone needed to prevent unacceptable soil erosion and delivered sediment production was based on local knowledge of soils, storm intensities, precipitation zones, plant communities, and stream hydrology (Forest Soil Scientist and Forest Hydrologist). Determining the amount, kind, and size of vegetation and down woody debris needed to maintain stable hydrologic balance in this zone is subject to controversy.

Because the Riparian-Aquatic Habitat Protection Zone extends through several very different climatic zones, many different kinds of geologic materials, and a very wide range of different soil types, there is a need to develop some site specific studies so that the protection needs for the "average situation" can be validated and supported.

Site specific studies could also provide information on the true effect of the variable-width protection zones, and determine their contribution towards the desired results.

BEST MANAGEMENT PRACTICES

DEFINITIONS

Nonpoint sources or nonpoint source pollution refers to pollution that enters any waters of the State from any dispersed [or unconfined] land based or water based activities, including, but not limited to atmospheric deposition, surface water runoff from agricultural lands, urban areas, or forest lands, sub-surface or underground sources, or discharges from boats or marine vessels (Washington Administrative Code 412-200). For example, silvicultural sources, such as surface erosion from a harvest unit or erosion from a haul road, are considered nonpoint sources.

Best Management Practices (BMPs) are defined as “methods, measures, or practices selected by an agency to meet its nonpoint source control needs. BMPs include, but are not limited to, structural and nonstructural controls, operations, and maintenance procedures. BMPs can be applied before, during, and after pollution-producing activities to reduce or eliminate the introduction of pollutants into receiving waters” (40 CFR 130.2, EPA Water Quality Standards Regulation).

Usually BMPs are applied as a **system** of practices rather than as a single practice. BMPs are selected on the basis of site-specific conditions that reflect natural background conditions and political, social, economic, and technical feasibility (EPA Interagency Nonpoint Task Force, 1985).

BMPs are basically a preventive rather than an enforcement system. BMPs are a whole management and planning system in relation to sound water quality goals, including both broad policy and site-specific prescriptions.

INTRODUCTION

Best Management Practices are the primary mechanism to enable the achievement of water quality standards (Environmental Protection Agency, 1987). BMPs will be selected and tailored for site-specific conditions to arrive at the project-level BMPs for the protection of water quality.

The process for determining appropriate BMPs, and for ensuring their implementation, at both the Forest Plan and Project level, is described in this appendix. This Forest Service Nonpoint Source Management System is aimed at protection of water quality, as reflected in the following text. However, the critical role of BMPs in the integrated management of soil, fish habitat and related resources must also be recognized.

Following is a description of the methods and procedures that will be used to control or prevent non-point sources of pollution from resource management activities. This system is designed to ensure compliance with the following laws and related agreements:

Clean Water Act of 1972, as amended (1977 and 1987). Section 319 of the Clean Water Act Amendments of 1987 requires that the States determine those waters that will not meet the goals of the Act, to determine those nonpoint source activities that are contributing pollution, and to develop a process of determining BMPs to reduce such pollution to the “maximum extent practicable”. This Appendix is designed to fulfill the intent of the requirements of Section 319.

Washington Administrative Code (Chapters 173-201 and 202). Department of Ecology (DOE). Washington’s Administrative Code contains water requirements for protection of various classes of surface waters.

Memorandum of Understanding: The Washington Department of Ecology and U.S. Department of Agriculture Forest Service (7/79), and “Attachment A” referred to in this MOU (Implementation Plan for Water Quality Planning on National Forest Lands in the Pacific Northwest 12/78).

The EPA has certified the Washington Forest Practices Rules and Regulations as BMPs. The State of Washington compared Forest Service practices with these State practices and concluded that Forest Service practices meet or exceed State requirements. As State practices change, comparisons are made to ascertain that Forest Service practices meet or exceed these changes. Monitoring and evaluation will also determine the need for changes in BMPs and/or State standards.

Forest Services management practices will meet, as a minimum, the substantive State BMP requirements, and other considerations required by the National Forest Management Act (NFMA), and other authorities, for the protection of soil, water and related resources.

The general BMPs described herein are action-initiating mechanisms which call for the development of detailed, site-specific BMP prescriptions to meet water quality objectives and protect beneficial uses. These prescriptions are developed as part of the NEPA process, with interdisciplinary involvement by a team of individuals that represent several areas of professional knowledge, learning, and/or skill appropriate for the issues and concerns identified. BMPs also include such requirements as Forest Service manual direction, contract provisions, environmental documents, and Forest Plan Standards and Guidelines. Inherent in prescribing project-level management requirements is recognition of specific water quality objectives which BMPs are designed to achieve.

BMP IMPLEMENTATION PROCESS

In cooperation with the State, the primary strategy for the prevention and control of nonpoint sources is based on the implementation of BMPs determined necessary for the protection of the identified beneficial uses.

The objective is to identify the most practical means of attaining water quality objectives. Water quality objectives include water quality measures that adequately reflect the needs of identified beneficial uses.

The Forest Service Nonpoint Source Management System consists of:

1. Selection and design of BMPs based on site-specific conditions, technical, economic and institutional feasibility, and the water quality standards of those waters potentially impacted.
2. Implementation and enforcement of BMPs.
3. Monitoring to ensure that practices are correctly applied as designed.
4. Monitoring to determine the effectiveness of practices in meeting design expectations and in attaining water quality standards.
5. Evaluation of monitoring results and mitigation where necessary to minimize impacts from activities where BMPs do not perform as expected.
6. Adjustment of BMP design standards and application when it is found that beneficial uses are not being protected and water quality standards are not being achieved to the desired level. Evaluation of the appropriateness of water quality criteria to reasonably assure protection of beneficial uses. Consideration of recommending adjustment of water quality standards.

BMP Selection and Design - Step 1

Scoping: Potential concerns are identified, e.g., water quality, as part of the NEPA process for environmental analysis. Public notices are dispersed inviting comment and participation in the process. Alternatives are developed to address potential problems and to accomplish project objectives.

Environmental Analysis: Each alternative is evaluated for its potential effect on different resources, including water. From this analysis, a preferred alternative is identified, along with the measures (BMPs) needed to reduce risk and increase the potential for success.

Documentation: An Environmental Assessment (EA) or Environmental Impact Statement (EIS) is developed with a decision notice and includes required measures (BMPs).

Water quality standards are used as objectives towards which practices are designed to protect beneficial uses.

Appropriate BMPs are selected for each project by an interdisciplinary team. BMP selection and design are dictated by water quality objectives, soils, topography, geology, vegetation, climate, economics, institutional constraints, etc. Environmental effects and water quality protection options are evaluated and a range of practices is considered. A final set of practices are selected that not only protect beneficial uses, but meet other resource needs. These final selected practices constitute the BMPs.

The selected BMPs, an estimate of their effectiveness, and a plan for monitoring them is included in the project EA or EIS. The site-specific BMP prescriptions are normally included in project implementation plans, but may also be included in the body or appendix of a project environmental document.

BMP Implementation and Enforcement - Steps 2 and 3

The site-specific BMP prescriptions are taken from plan-to-ground by a combination of project layout and resource specialists (hydrology, fisheries, soil, geology, etc.). Final adjustments to fit the BMP prescriptions to the site are made before implementing the resource activity.

When the resource activity (e.g., timber harvest or road construction) begins, timber sale administrators, engineering representatives, resource specialists, and others ensure that the BMPs are implemented according to plan. A similar implementation process is used for other resource activities (range management, mining, etc.) on National Forests.

BMP implementation monitoring is done before, during, and after resource activity implementation. This monitoring answers the question: Did we do what we said we were going to do? Some examples of implementation monitoring for a Riparian Management Area BMP prescription may be:

- 1. Before project:** checking Riparian Management Areas along streams to see if layout meets the objectives of the BMP prescription, or if the road crossing of a stream is properly located and designed per estimates made during the environmental analysis.
- 2. During project:** during timber felling, the timber sale administrator checks to see if the timber fallers understand marking prescription for timber to be felled in the SMU. The timber sale administrator also observes on-going harvest operations to see if the activity meets the objectives defined in the project plan.
- 3. After project:** measuring canopy stream shading to see if the amount specified in the BMP prescription was retained, or monitoring a beneficial use of the water to determine a change or trend in use.

Enforcement is carried out primarily through internal project reviews and contractual enforcement e.g., timber sale contract, grazing or special use permit, etc.

Contract enforcement is a more formal method used to achieve desired results. Normally, each project is assigned a person as a contracting officer. For timber sales, that person is called a timber sale administrator. The project is routinely monitored to ensure that practices are being carried out in the manner and method prescribed in the contract, permit, etc. When a contractor or permittee is not in compliance, they can be held in breach with penalties (e.g., bond forfeiture) until remedies are implemented.

Often during the course of an activity, adjustments are made if it is determined that unsatisfactory results are currently resulting or may occur. This can often mean that a contract modification may be necessary (as in the case of a timber sale).

BMP Monitoring - Step 4

Once BMPs have been implemented, further monitoring is done to evaluate their effectiveness. BMP "effectiveness monitoring" answers the question: Are BMPs effectively meeting management objectives for protection of water quality?

Water quality standards are the "yardstick" against which the effectiveness is tested. If, through objective monitoring, BMPs do not meet prescribed objectives, then information is available to modify either the BMPs for future management, or the objectives, or both.

The natural variability of water quality under unmanaged conditions is an important factor that will be considered during the monitoring and evaluation. Additionally, effectiveness monitoring will include measurement against land management objectives as well as water quality objectives.

Some examples of the types of BMP effectiveness monitoring to be conducted are:

1. Measuring stream temperatures to see if the riparian prescriptions in a watershed are maintaining water temperature.
2. Storm period surveillance monitoring of a road system to see if road rocking is effectively preventing road surface erosion.

The monitoring and evaluation section of the Forest Plan, (Chapter 5), provides that monitoring of BMPs will be accomplished on an appropriate sample basis.

Once a specific project is designed, a site-specific monitoring plan may be developed.

Results of monitoring should be shared with State and local agencies as well as available to the public. Monitoring design, sampling, and laboratory analyses will be coordinated.

BMP Evaluation and Adjustment - Step 5 and 6

The technical evaluation/monitoring described above will determine how effectively BMPs protect and/or improve water quality. If the evaluation indicates that water quality objectives are not being met and/or beneficial uses do not appear to be receiving adequate protection, corrective action will consider the following three components:

1. **The BMP:** Is it technically sound? Is it really best, or is there a better practice which is technically sound and feasible to implement?
2. **The implementation program or processes:** Was the BMP applied entirely as designed? Was it only partially implemented? Were personnel, equipment, funds, or training lacking which resulted in inadequate or incomplete implementation?
3. **The water quality standards:** The water quality standards are established to protect the beneficial uses of water. They include numeric and narrative criteria that, when exceeded, are assumed to indicate detrimental impacts on beneficial uses. They are intended to provide a benchmark for evaluating harm to beneficial uses.

Assessing the applicability of the standards is a responsibility of the State. The Forest Service will provide information to the State to address the following types of questions.

Do the standards describe the conditions necessary for protecting beneficial uses?

Are standards higher or lower than that necessary for protecting beneficial uses?

Do the standards reflect the natural variability occurring within the natural and human-affected ecosystem?

Do the parameters and criteria that constitute water quality standards adequately reflect (are they sensitive enough) human-induced changes to water quality and beneficial uses?

“Validation” monitoring may be needed to make this assessment. The purpose of validation monitoring is to answer the question whether standards, coefficients, requirements, and guidelines are appropriate to meet objectives, e.g., protect beneficial uses.

- Examples: (1) Did the change in water temperature impact the fish population?
(2) Did the soil compaction effect tree growth?

Validation Monitoring will need to be closely coordinated with or, in some cases, conducted by research. It may require the establishment of permanent plots or administrative studies. This kind of monitoring will be very limited and will require coordination to select projects with broad application and to prevent duplication. Only those coefficients and standards that are not reasonably validated by existing research or documentation should be candidates for this monitoring.

Corrective action may be initiated once the reason for failing to achieve the management objectives is determined. The management practice may have to be changed, the water quality objectives modified, or both.

TRAINING

National Forest personnel involved with project location, design, layout, administration, and maintenance activities will receive BMP training. The training will consist of BMP awareness, as well as on the more technical aspects such as planning, implementation, monitoring, and evaluation.

GENERAL BEST MANAGEMENT PRACTICES AND EXAMPLES

Individual, general Best Management Practices are described in General Water Quality Best Management Practices, Pacific Northwest Region, 11/88. This provides guidance, but is not a direction document. Also included in this document is a description of the process, and limitations and use of these BMPs. Each BMP listed includes the Title, Objectives, Explanation, Implementation and Responsibility, and Monitoring. Evaluations of ability to implement and estimated effectiveness are made at the project level.

Not all of the general BMPs listed will normally apply to a given project, and there may be specific BMPs which are not represented by a general BMP in this document.

The sensitivity of the project determines whether the site-specific BMP prescriptions are included in the EA/EIS or in the sale/project plan, or in the analysis files.

Following is an example of a general BMP, as described in this document, along with an example of a site-specific BMP which is developed at the project level.

Examples:

General BMP

T-5. Title: Limiting the Operating Period of Timber Sale Activities

Objective: To ensure that the Purchaser conducts operations in a timely manner, within the time period specified in the Timber Sale Contract (TSC).

Explanation: The TSC specifies a Normal Operating Season, during which, operations may generally proceed without resource damage. Operations are permitted outside the Normal Operating Season only when they can be conducted without damage to soil, water, and other resources. Where determined to be necessary through the environmental analysis, the TSC will limit operations to specific periods or weather conditions. Operations are not permitted to continue if damage will occur. This is a timber sale C clause.

Implementation & Responsibility: Limited operating periods are identified and recommended during the Timber Sale Planning Process by the interdisciplinary team and followed through the life of the timber sale primarily by the Sale Administrator.

Ability to implement: Add at project level.

Effectiveness: Add at project level.

Monitoring: During implementation of timber sale activities by the Sale Administrator, Forest Service Representative (FSR), engineers, watershed and fish habitat specialists. Also see Forest Plan monitoring plan for Soil, Water and Fish Habitat Resources.

Specific BMP

PT-5. Title: Limiting the Operating Period of Timber Sale Activities

Objective: To ensure that the Purchaser conducts operations in a timely manner, within the time period specified in the Timber Sale Contract (TSC).

Explanation: The Ship Mountain Timber sale contains sensitive soils that are subject to soil compaction during tractor skidding, and a non-surfaced road that is not suitable for wet weather haul.

The normal operating season for the Forest will be enforced for the Ship Mountain Timber sale. All operations off road FR 10 (non-surfaced) will be halted at the onset of wet weather to prevent erosion and damage to the road. Tractor skidding on units 1-5 will be restricted if soil moisture is above the level established by the soil scientist. Other operations can continue outside the normal operating season if they can be conducted without damage to soil, water, and other resources.

Implementation and responsibility: For the Ship Mountain Timber sale the normal operating season for the Forest will be enforced. All operations off road FR 10 (non-surfaced) will be halted at the onset of wet weather to prevent erosion and damage to the road. Other operations can continue outside the normal operating season if they can be conducted without damage to soil, water, and other resources. The Forest watershed specialists will work with the timber sale administrators to evaluate the potential for resource damage if operating outside the normal operating season.

Ability to implement: High

Effectiveness: High

Monitoring: During implementation of timber sale activities by the Sale Administrator, Forest Service Representative (FSR), engineers, and watershed specialists. Also see Forest Plan monitoring plan for Soil, Water and Fish Habitat Resources.

APPENDIX K

FOREST SERVICE RESPONSE TO COMMENTS

INTRODUCTION

This Appendix describes the efforts made by the Wenatchee National Forest to involve and consult the public during the review of its Proposed Forest Plan, Draft Environmental Impact Statements (Draft EIS) and Supplement to the Draft Environmental Impact Statement (Supplement EIS). Included in this Appendix are representative comments received and the Forest Serviceresponses. This document adds to Appendix A, which includes issues, concerns, and opportunities identified by the public during the formal 120-day public review period for the DEIS and the 90-day formal review period for the Supplement to the DEIS.

Presented first is a description of the public participation activities, followed by a summary of the types of comments received on the Proposed Forest Plan, Draft EIS and Supplement EIS. This summary includes a breakdown of comments by resource or issue.

Next is a list of people, agencies, and organizations who commented on the Draft EIS and Supplement EIS. A summary of the Final Environmental Impact Statement (Final EIS) or a complete Final EIS document package has been sent to those listed.

The fourth section contains summarized comments from the general public, organized by resource or subject area, along with the Forest Serviceresponse to each.

The last section contains copies of letters from elected officials and public agencies.

DRAFT ENVIRONMENTAL IMPACT STATEMENT AND FOREST PLAN

DISTRIBUTION OF DOCUMENTS

The Draft Planning documents for the Wenatchee National Forest were available for public comment beginning in early June, 1986, with mailings to the Forest's mailing list of approximately 2,600 individuals beginning on June 9, 1986. A Federal Register Notice was published on June 20, 1986 with a ninety day review period ending on October 1, 1986. Planning documents were also available at Forest Service offices and local libraries and were distributed at a series of public meetings.

The planning documents consisted of the Draft EIS, Forest Plan, Appendices to the Draft EIS, and a Reviewer's Guide Summary of the Draft EIS. All those on the Forest Plan mailing list received the Reviewer's Guide, and the entire planning documents were mailed to those who had requested them. Through mailings and personal contacts, over 4,500 copies of the Reviewer's Guide and 850 sets of the complete documents were distributed to the public.

PUBLIC ANNOUNCEMENTS-NEWS RELEASES

Fifteen news releases and 16 Forest Plan Reports were distributed throughout the planning process, beginning May 23 1979.

In January, 1982, an informational letter was sent to 2,400 individuals and organizations on the general forest mailing list as well as to about 400 Wenatchee National Forest employees. Its purpose was to gather information on whether an adequate variety of alternatives were included in the Forest plan.

A special effort was made to locate individuals who own land within or adjacent to the Wenatchee National Forest. In a joint effort with the Mt. Baker-Snoqualmie National Forest, a paid advertisement was placed in 16 newspapers to notify these individuals about the forest planning.

News conferences regarding the Draft Plan were held in Wenatchee, Yakima & Seattle, June 9-10, 1986.

PUBLIC MEETINGS AND PRESENTATIONS

Between June 18-23, 1979, four public workshops were held in Wenatchee, Yakima, Seattle and Tacoma to explain the Forest planning process and receive ideas on issues which needed to be addressed in the Forest Plan.

Eleven public meetings were held to give information and receive public input on the Draft Planning documents. These meetings were held at the following locations:

Wenatchee	July 14, 1986	70 attendees
Chelan	July 15, 1986	30 attendees
Ellensburg	July 16, 1986	70 attendees
Entiat	July 17, 1986	38 attendees
Leavenworth	July 21, 1986	33 attendees
Seattle	July 22, 1986	53 attendees
Tacoma	July 23, 1986	25 attendees
Cle Elum	July 28, 1986	55 attendees
Yakima	July 29, 1986	90 attendees
Richland	July 30, 1986	30 attendees
Plain	July 31, 1986	25 attendees

Presentations of the Proposed Plan were made to a total of 164 people, members of eight organizations. These included:

Manson Kiwanis	June 11, 1986	35 Attendees
Environmental Protection Agency	June 17, 1986	6 Attendees
Yakima Indian Nation	July 29, 1986	10 Attendees
NCW Trail Riders Assoc.	Aug. 7, 1986	14 Attendees
Rock Club - Wenatchee	Aug. 8, 1986	11 Attendees
North Central WA Sports Council	Aug. 21, 1986	8 Attendees
Timber Industry - Ellensburg	Sept. 16, 1986	35 Attendees
Tacoma Motorcycle Club	Sept. 17, 1986	45 Attendees

Wenatchee National Forest Staff members also met with the following groups regarding the Proposed Plan: Timber and Wood Products Group, Governor's Office, Peninsular Wilderness Club, Washington State Economic Development Board, Liberty Mountain Ownership Association, Leavenworth City Council - Icicle Design Review Committee, and the Wenatchee Timber Committee.

SUPPLEMENT TO THE DRAFT ENVIRONMENTAL IMPACT STATEMENT

DISTRIBUTION OF DOCUMENTS

On October 1, 1988, the Wenatchee National Forest released a Supplement to the 1986 Draft Environmental Impact Statement, for public review and comment. The Supplement contained a discussion of a "No Change Alternative," an analysis of the opportunity costs of changes in management requirements used in developing the alternatives in the DEIS and an analysis of rivers on the Forest for recommendation for classification in the Wild and Scenic Rivers System. All three topics were selected for further analysis as a result of public comment on the DEIS and Forest Plan.

The 260-page Supplement was mailed to approximately 600 people and organizations who requested it. A 60-page Summary was mailed to this same mailing list as well as to approximately 6,000 people on the Forest Plan mailing list. A Federal Register Notice was published on October 21, 1988 with a 90 day review period ending on January 20, 1989. Copies of both documents were also available on request from the Ranger District offices.

PUBLIC ANNOUNCEMENTS-NEWS RELEASES

Two new releases and two Forest Plan Reports were released in support of the public review process for the Supplement.

PUBLIC MEETINGS AND PRESENTATIONS

Eight Public Meetings were held at the following locations:

Entiat	November 28, 1988	28 attendees
Lake Wenatchee	November 29, 1988	57 attendees
Wenatchee	November 30, 1988	32 attendees
Seattle	December 1, 1988	13 attendees
Cle Elum	December 5, 1988	12 attendees
Ellensburg	December 6, 1988	11 attendees
Leavenworth	December 7, 1988	50 attendees
Yakima	December 8, 1988	16 attendees

In addition, Forest Service staff also made presentations to the following organizations: Chelan County Farm Forestry Association, Yakima Nation Tribal Council, Chelan, Yakima and Kittitas County Commissioners, Governor's Office and also a second public meeting in Wenatchee sponsored by the Friends of Wild Rivers.

OVERVIEW OF PUBLIC COMMENTS

The Wenatchee National Forest received 4,665 responses to the Draft EIS and Forest Plan, and 2,650 responses to the Supplement to the Draft EIS. Comments from these respondents were coded, cross-referenced and analyzed. Original letters are filed and accessible to anyone wishing to review them at the Forest Supervisor's Office in Wenatchee, Washington.

SOURCE OF RESPONSES TO THE DRAFT EIS

Origin of Responses

The majority of comments came from respondents living in Washington State (4,351 or 92%); however, there were also responses from Oregon, Idaho, California, and one from American Samoa. The following is a more detailed breakdown of response origin.

Washington State

Eastern Washington 2,637 or 56% of total response	Western Washington 1,714 or 36% of total response
--	--

Outside Washington

Oregon - 169 Idaho - 23	California - 27 Other - 95
----------------------------	-------------------------------

Of the major cities represented in the response from the public in eastern Washington, Yakima led in number of responses with 807. The western Washington city from which the most responses were received was Seattle with 1,071.

WHO RESPONDED

In this statistical category, signatures were tallied rather than responses. This means that the total in this category exceeds the 4,665 figure, but the breakdowns still provide for relevant comparisons. The following is a detailed breakdown of who responded.

Who	Number of Signatures
Individuals	4,846
Business Groups	59
Conservation/Environmental Groups	42
Motorized Recreation Interests	24
Associations/Unions	14
Federal Agencies	13
Hunting/Sporting Groups	12
Timber Industry	11
City Municipal Government	9
Riding Groups	9
Civic Groups	7
County Elected Officials	5
City Elected Officials	5
Irrigation Districts	5
Yakima Indian Nation/Inter-Tribal Commission, etc.	5
State Elected Officials	3
Mining Interests	3
State Agencies	3
Hiking Interests	3
Federal Elected Officials	2
County Agencies	1
Professional Societies	1

METHOD OF RESPONSE

The form of response was divided fairly equally between individual letters and post cards and the “Essential Alternative Ballot.” The ballot was developed by the Wenatchee Timber Purchasers Association and 6,000 were printed for distribution within the Pacific Northwest. The Forest received 2,061 of the ballots (44% of response) as input to the Forest Planning Process. A total of 1,996 individual letters and cards (43% of response) were received.

Additionally, 396 Forest Service Response Forms (8% of response) were returned to the agency. Five petitions, one resolution, and two oral comments were also received.

The remainder of the almost 300 responses were primarily form letters. The following details this breakdown.

Form Letters

Mining Rights - 125	General Form Letters - 111
Friends of Holden Village - 20	Friends of Lake Wenatchee - 10
Modified Form Letters - 8	Stormy Mountain Ski Area - 3

SOURCE OF RESPONSES TO THE SUPPLEMENT

Origin of Responses

A total of 2,650 responses to the Supplement were received. Most responses came from Washington State with roughly half from eastern Washington and half from western Washington. About half of the responses received were “ballots” in support of the timber industry and form letters in support of off-road vehicle recreation. The majority of “ballots” were from eastern Washington (64%) and the majority of form letters were from western Washington (66%).

Who Responded

Comments on the Supplement were directed to the three issues covered by the Supplement: Wild and Scenic Rivers Analysis, the No Change Alternative and the Management Requirements Analysis. The breakdown of the responses is shown below.

Individual comments on Wild and Scenic Rivers	400
Landowner comments on Wild and Scenic Rivers	95
Timber industry letters	48
Timber Industry ballots	1,183
Off-Road Vehicle recreation letters	665
Elected Officials, U.S., State and Local Agencies	13
Individual comments concerning other issues	146

SUMMARY OF COMMENTS BY SUBJECT ON THE DRAFT EIS AND FOREST PLAN

Recreation (in General) (412 comments) - Most comments suggested that the emphasis on the Wenatchee should shift from timber and commodity orientation to a recreation/amenity emphasis. Industry comments were concerned that the Forest is already providing dispersed and developed recreation in excess of projected demand. Another concern from the public was that demand projections should also take into account population growth on the west side of the state.

Developed Recreation/User Fees (86/73 comments) - Some comments were received supporting improved campgrounds. Comments on user fees generally supported them.

Downhill Skiing (124 comments) - The majority of these comments were by proponents of a Stormy Mountain Ski Area near Lake Chelan. These people wanted the area included in an allocation that did not preclude the possibility of future development. Others expressed concern that expanded facilities at Mission Ridge near Wenatchee would adversely affect wildlife.

Trails (1287 comments)- This subject received one of the larger volumes of comments. The major message: Don't reduce the trail mileage! Also a substantial number of comments were related to hiker/ORV conflicts and a strong dislike of hiking through clearcuts.

ORV use (2929 comments) - Not counting the timber industry ballot, this subject received the most comments of any issue. The majority of comments were against ORV use in general, but especially against any expansion of ORV use. We also received many comments opposing ORV use on trails leading into wilderness. Several substantive comments contended the Forest Service has violated federal Executive Orders relating to ORV's. The overall issue is very emotional.

Hiking Areas - This subject was the object of a campaign generated by the Washington Trails Association. We received 301 comments in support of designating the four proposed areas as "hiking only" areas. An additional 135 comments supported specific areas, and 26 were against them.

Rockhounding (195 comments) - We received very site specific comments on this subject. A large percentage of comments were from older people who desired better access.

Scenery (771 comments) - The comments showed strong public support for a natural appearing forest, especially along major travel routes such as Snoqualmie and Blewett Pass. Industry comments contended that scenic travel allocations were too strict.

Wild & Scenic Rivers (852 comments) - Nearly all comments supported classification of the Chiwawa, Entiat, North Fork Entiat, Mad, Wenatchee, White, and Yakima Rivers. Many also included the Icicle and Little Wenatchee Rivers. This was part of the environmental coalition Alt. F campaign list. Several substantive comments were received in favor of classification, and also expressed concern over the adequacy of the standards and guidelines for protecting river corridors.

Special Interest/Botanical Areas (258 comments) - Most comments received were in support of Alt. F allocations. A small campaign generated comments for several site specific botanical areas.

Alpine Lakes Mgmt. Area (42 comments) - Industry felt strongly that the Alpine Lakes Plan should be looked at again because they felt the inclusion of Minimum Management Requirements (MR's) constitutes a change in the plan. Other public comments generally supported leaving the Alpine Lakes plan intact.

Mather Memorial Parkway (232 comments) - We received a large number of comments supporting preservation. A number of comments recommended transfer of the Parkway to the National Park Service.

Wilderness (1109 comments) - Most comments were concerned about the consistency of management adjacent to the wilderness. Many of comments opposed ORV use on trails leading into wilderness. Some support was received for buffer zones, particularly along the Alpine Lakes. Party size in wilderness was also a concern, especially for commercial outfitters.

Roadless Areas (2550 comments) - This subject was another of the major issues. Most comments supported preservation of all of them. Devil's Gulch and Entiat/Mad River received most of the site specific comments. Roadless comments were often tied together with old-growth comments. ORV users also supported roadless area preservation, mentioning the Manastash the most frequently.

Old Growth (1429 comments) - Another major issue. Most comments wanted preservation of the existing old growth. Comments were generally more emotional than on other issues. This issue was often tied in with roadless area preservation.

Multiple Use Commodity/Amenity (1150 comments) - A large number of comments were received here. Most fell into list of amenity items. Several comments on the commodity end asked "whatever happened to multiple use?"

Wildlife (1202 comments) - Most of the comments were general in nature favoring the preservation of wildlife and the increasing of their numbers. Often the comments included lists of amenity concerns. Concerns were also expressed about inadequate wildlife data, a perceived timber bias in the plan, and weak standards and guidelines. General comments about habitat, especially for big game species, was also a big concern with 520 comments received. These comments covered topics such as inadequate range, impacts of roads and timber management, and conflicts with grazing and private lands.

Wildlife-MR's (161 comments) - Most comments were process related issues from the timber industry. They felt the Minimum Management Requirements (MMR's) were too restrictive, and objected to the development of MMR's without public involvement. Other public comments noted the MMR's were inadequate, especially for old growth dependent species.

Spotted Owls (2302 comments) - A large number of comments were received with most being from the timber industry ballot opposing the acreage set aside for Spotted Owl Habitat Areas (SOHA's). This issue tied in strongly with the old growth management issue. Comments on both sides of the issue noted that the data was inadequate.

Fish (1211 comments) - This was another major issue. Most of the general public comments were in favor of preserving and increasing the numbers of fish. The comments were often intermixed with timber harvest effects, sedimentation, and water quality. This issue received the most comments from state, federal and tribal agencies. There also was consistent support expressed for more research, and concern for continued management without sufficient data.

Riparian Habitat (272 comments) - Most comments were related to preserving water quality and fisheries. This issue received the most input concerning the adequacy of the standards and guidelines.

Threatened and Endangered (461 comments) - Several substantive comments asked that T&E species be addressed in more detail throughout the documents. The public also proposed specific sites for botanical areas. In addition, this subject received many general comments from the Alt. F campaign. Most comments stated the discussion was inadequate, disagreed with the effects of management activities, and felt more data was needed.

Range and Vegetation (918 comments) - A large number of general comments opposed increased grazing. There was also concern expressed over grazing impacts on native plants, conflicts with big game, and perceived subsidy of allotment holders.

Research Natural Areas (179 comments) - This was not a big issue although it was mentioned by some supporters of Alternative F and native plant society members.

Timber Resource (995 comments) - Timber management and logging were among subjects receiving the largest number of comments. Related comments are broken down further in the next four subject areas.

Harvest Levels (3048 comments) - This one subject received more comments than any other. Nearly 2000 of these comments were from the industry ballot expressing support for increased harvest levels. The majority of the remaining comments requested reduced harvest levels. Many of these comments tied harvest levels to impacts on soil, water, fish and wildlife.

Below Cost Sales (345 comments) - A considerable number of comments were received with nearly all in opposition. This issue was often tied in with road building, road costs, and roadless areas.

Land Suitability, Yield Tables, Utilization Standards (312 comments) - These issues all received substantive comment from timber industry questioning the approach used by the Forest Service. Other public comments felt that more land was unsuitable for harvest, notably in roadless areas.

Harvest Methods, Even/Uneven-aged Management, Harvest Effects (1452 comments) A major portion of the comments were opposed to clearcutting. Water quality, sedimentation, and fisheries issues were also tied in. Industry, as well as general public input, called for a more detailed discussion of harvest methods.

Water (1408 comments) - Most of the comments expressed concern over water quality, watersheds in general, timing of runoff, and irrigation. These comments related to harvest effects, grazing, sedimentation and fisheries. Substantive comments on water were received from government agencies, tribal groups, and county commissioners. A number of comments were concerned with municipal watersheds, especially the Roslyn and the Icicle River. Those who commented thought private lands should be acquired within the watersheds, and the drainage protected to preserve water quality.

Soil (412 comments) - Soil was included on a broad list of environmental concerns but also received specific comments in relation to water quality, harvest effects, erosion, the Devil's Gulch area, and ORV use.

Land Status (215 comments) - Most of the comments were related to the impacts of clearcutting on intermingled private lands and cumulative effects.

Minerals (539 comments) - Many comments received came in a mining form letter which focused on the use of the term "highly restricted" in the DEIS discussion of mineral resources.

Roads (1386 comments) - The majority of comments received opposed increased road construction, and many citing road costs. This issue was also related to below cost sales, timber sales, and roadless area allocations. Many comments were received in favor of increased road closures.

Naches Pass Road (274 comments) - Nearly all of the comments received were in opposition to construction of the road. This is a big issue for both the Wenatchee and the Mt. Baker-Snoqualmie National Forests.

Economics (992 comments) - Topics under this general heading received some of the largest volumes of input. Substantive input was received from both industry and environmental groups. There was major disagreement with our economic assumptions, modeling procedures, and projected outputs. Comments on this subject area are broken down in the following four paragraphs.

Receipts to Counties (2154 comments) - Substantive input was received from both county officials and school district personnel opposed to any reduction in funds. The majority of these comments came from the industry ballot.

Employment and Job Security (554 comments) - Most of the comments opposed any reduction in jobs caused by a reduction in timber harvest levels. This issue was also related to comments stressing the need to change from a timber based economy to a recreation/tourism based economy.

Short-term/Long-term Economic Benefits (195 comments) - Most comments contended that the DEIS didn't consider the long-term, especially from an amenity standpoint.

Timber/Tourism Based Economy (895 comments) - A considerable number of people felt the DEIS was too biased towards timber and did not take into account the number of jobs recreation and tourism provided. The opposing viewpoint was the Forest Service didn't take into account how important the timber industry was to our economy.

Social Considerations (746 comments) - Most of the comments stressed the need for more of an amenity emphasis in the management of the Forest. There was also a strong viewpoint expressed for preservation of the natural beauty of the forest for future generations.

Forest Coordination Efforts (72 comments) - A few substantive comments were received especially from other government agencies, stressing the need for better interagency coordination.

Indian Rights (30 comments) - This issue received substantive comments from both the Yakima Nation and the Intertribal Fish Commission mainly relating to water quality, and fishing and hunting rights.

Planning in General (1334 comments) - The many comments concerning the planning process cited a perceived lack of good inventories, inadequate monitoring plans, failure to meet NFMA and NEPA regulations for public input into the plan, flaws in the modeling process, and seemingly arbitrary adjustments of economic values. Many of the planning process comments appeared to be in preparation for appeal of the plan. Several substantive comments contended the standards and guidelines were inadequate and not restrictive enough. This was especially true in relation to the DEIS discussion of riparian areas, fish, water, and wildlife.

Cumulative Effects (266 comments) - Most of these comments dealt with the cumulative effects of forest management activities on soil and water. This issue also tied in with management on intermingled private land, timber harvest effects, fisheries, sedimentation, and water quality.

SUMMARY OF COMMENTS BY SUBJECT ON THE SUPPLEMENT TO THE DRAFT EIS

Wild and Scenic Rivers Proposal Support (80 comments) - The comments in support of the proposal were both general in nature and specific references to the values of the rivers considered in the Supplement.

Wild and Scenic Rivers Proposal Opposition (80 comments) - General opposition comments listed specific concerns as the reason for opposition. The concerns cited were: potential for condemnation, defacto designation of wilderness, restricted individual rights, preference for local control, more analysis needed, restrictions on property owners, limitation of multiple use, loss of control over timber management and restrictions on development.

Additional Rivers Should be Included (340 comments) - Most of the comments supported the proposed rivers but felt more rivers should be proposed for inclusion in the Wild and Scenic Rivers System. Some of the rivers mentioned were: Little Wenatchee, North Fork Entiat, Mad, Cooper, Silver, Teanaway, Waptus, Little Naches, Bumping, Naches, Rattlesnake and Tieton.

Landowner Opposition to Specific River Proposals (95 comments) - Most of the comments from landowners contended that existing regulation were adequate to protect the rivers and that designation would result in the loss of local control. The specific rivers mentioned were: Wenatchee, Entiat, Nap-equa, Icicle and Chiwawa.

Landowners Support of Wild and Scenic Proposal (6 comments) - The comments by landowners expressed some level of support for the proposal and a few indicated additional rivers should be included.

Support of the No Change Alternative (85 Comments) - Some of the comments supported the No Change Alternative without specific reasons, while others mentioned concerns for the stability of the economy. Other comments stated the current management of the forest is adequate and present recreation opportunities, such as off-road vehicle trail allocations, should not be changed.

Opposition to the No Change Alternative (79 comments) - Most of the comments opposed the No Change Alternative because of the detrimental effects on the forest environment and the amount of timber harvest allowed. A few comments mentioned that the alternative did not meet legal requirements.

Support of Management Requirements (30 comments) - The majority of the comments cited support for preservation of amenity values as the reason for support of the Management Requirements.

Opposition to Management Requirements (30 comments) - Many comments said the information on Management Requirements was difficult to comprehend. Concern for the effects was also cited, including loss of jobs and community stability.

Timber Industry "Ballots" (1,183 comments) - The Timber industry provided "ballots" which allowed individuals to check their preferred harvest level, ranging from 118 to 211 million board feet. The majority checked the two highest harvest levels, 211 and 180 million board feet. The form included a section concerning analysis of the Wild and Scenic River designations. The majority checked a box asking the Forest Service to complete further analysis of the impacts on other resources before recommending rivers for designation.

Off-Road Vehicle Form Letters (665 comments) - Two similar form letters were received concerning off-road vehicle use. Both form letters expressed support for the No Change Alternative because off-road vehicle recreational opportunities could continue unchanged. They also expressed concern over the effects of Wild and Scenic River designation on motorized trails.

NAMES OF RESPONDEES

A total of 4,665 responses were received on the D.E.I.S documents and 2,650 responses on the Supplement. This section contains the names of all respondents and the number assigned to their comments. Respondees to the D.E.I.S. are listed first. The respondees to the Supplement follow, and are distinguished by the letter "S" following the number.

REPRESENTATIVE COMMENTS AND FOREST RESPONSES

The Wenatchee National Forest received 4,665 responses to the Forest Plan and Draft EIS and 2,650 responses to the Supplement to the Draft EIS. Many of the individuals who responded to the Draft EIS also responded to the Supplement EIS. Comments received on the Supplement are distinguished by the letter "S" after the number.

The comments are arranged by resources and subjects with specific topics and concerns addressed under each category. These are followed by the Forest Service response.

The comments received were instrumental in the development the final Forest Plan and Final EIS. Several changes have been made that directly reflect the concerns and issues that were raised by the public.

Because of the magnitude of the response, there were comments that were similar in content. We have, therefore, chosen to respond to what we believe to be representative comments. Although some reviewers may not find their exact comment, we are confident they can find one that represents their point of view.

In responding to public comment the Forest Service followed regulation 40 CFR 1503.4, therefore responses are based on one or more of the following areas:

1. Modification of alternatives including the preferred alternative.
2. Development and evaluation of alternatives not previously given serious consideration by the agency.
3. Supplementation, improvement or modification of the analyses.
4. Factual corrections
5. Explanation of why the comments do not warrant further agency response, citing the sources, authorities, or reasons which support the agency's position and, if appropriate, indicate those circumstances which would trigger agency reappraisal or further response.

Types of comments received, not related to this planning process and, therefore not responded to include:

Several comments were of a site-specific nature or were an expression of opinion not related to the Forest Plan or EISs. Examples include, administration of rules in campgrounds, design of campground facilities, or littering of the forest. Comments relating to a specific Ranger District were forwarded to the District. Comments not relating to the Plan or EIS were not addressed and cannot be traced in this Appendix.

Several comments were editorial in nature and referred to errors in tables or inconsistency in numbers. We have not responded directly to all of the editorial type comments, but we have reviewed each and have made appropriate corrections where applicable.

Comments received on rules and regulations for the administration of contracts and permits have not been included. These types of concerns are responded to through another process which includes publishing rules and regulations in the Federal Register under the Code of Federal Regulations (CFR). When new regulations are published a public comment period is involved in that process.

Comments on the need for more law enforcement have been noted but not responded to in this process.

In order to make it easier for the respondent to find the response to their comments we have included respondent numbers just before the forest service response. Please recognize due to the volume of responses received and the logistics involved in this effort some errors or omissions may have occurred.

RECREATION

1 HOW WILL LAND ALLOCATIONS PROVIDE FOR VARIOUS RECREATION OPPORTUNITIES?

COMMENTS INCLUDED:

“I would like to see more land open for hunting and fishing, etc.”

“I feel your emphasis should be on recreation not timber.”

“Whether it is planned or not, as the population of the country increases, there will continue to be a substantial increase in recreation uses throughout the Wenatchee National Forest. (The Pacific Northwest is just being “discovered” recreationally by the rest of the country!) Any place chosen that does not take this increase into consideration is unrealistic.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0001, 0017, 0023, 0035, 0049, 0080, 0147, 0228, 0430, 0442, 0540, 0578, 0587, 0589, 0618, 0669, 0749, 0896, 1675, 1939, 2004, 2053, 2059, 2073, 2097, 2168, 2180, 2205, 2414, 2723, 2730, 2737, 2747, 2752, 2756, 2759, 2776, 2778, 2791, 2795, 2797, 2826, 2832, 2849, 2850, 2854, 2881, 2919, 2929, 2994, 3016, 3019, 3020, 3081, 3083, 3118, 3125, 3142, 3171, 3176, 3186, 3220, 3241, 3249, 3278, 3282, 3287, 3346, 3381, 3400, 3427, 3473, 3478, 3479, 3493, 3516, 3530, 3572, 3603, 3621, 3650, 3832, 3833, 3867, 3873, 4073, 4086, 4160, 4181, 4198, 4243, 4269, 4302, 4406, 4434, 4439, 4459, 4460, 4489, 4491, 4493, 4494, 4496, 4498, 4501, 9074, 9092, 0022S, 0040S, 0061S, 1053S, 1154S, 1155S, 1405S, 2055S, 2071S

FOREST SERVICE RESPONSE:

These points are well taken. An emphasis on recreation has occurred nationally with the new Recreation Strategy initiated by the Chief of the Forest Service. We have modified all the alternatives in the final Forest Plan to place more emphasis on recreation opportunities, maintenance of the recreation setting and improving the quality of trails, trailheads, campgrounds and other recreation facilities. We have greatly increased the scope and scale of our Capital Investment Program for developed sites and trails. (See Appendix A of the Forest Plan). In most alternatives we have increased the number of acres that will remain unroaded for more semi-primitive opportunities.

As part of the emphasis on recreation we have completed an analysis of additional rivers to be recommended for Wild and Scenic designation in various alternatives. (See Appendix E of the FEIS.) A specific management prescription for the Mather Memorial Parkway has been developed with more emphasis on recreation and scenery. (See Management Prescriptions, Chapter IV of the Forest Plan.)

2 MANAGEMENT OF DEVELOPED RECREATION SITES. (CAMPGROUND, PICNIC AREAS, BOATING SITES, ETC.)

COMMENTS INCLUDED:

“Recreation uses should be limited to those which will eventually provide a natural, historic, restored condition. We would wish to see the flow of recreational traffic stopped on National Forest lands.”

“We hope you will continue to provide many small, dispersed campgrounds (including some primitive ones) rather than over developing and centralizing them.”

“Some or maybe all campgrounds need to be fixed up. My family likes camping where there is a water system.”

“Allowing small non-fee developed campgrounds to deteriorate and disappear is the wrong answer.”

“I do not like the idea of campgrounds and recreation areas being contracted out for operation.”

“Our desire is to avoid a structural campground. Facilities and improvements desired are sanitary facilities, all weather surface (crushed gravel), some tent camping spots on the periphery, maximum retention of forest, and water supply.”

“There are few R.V. dump stations on the Forest.”

“I'd put more emphasis on developing nature trails, VIS opportunities, retrofitting developed sites for handicapped use and longer vehicles, replacing worn-out facilities, installing ski huts...etc.”

“Although it makes fiscal sense to invest recreation dollars in fee sites, the Forest Service should also resist the temptation to phase out all non-fee sites. Non-fee sites have been extremely popular over the years because many users prefer not to camp in large camp areas.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0018, 0037, 0044, 0061, 0094, 0147, 0262, 0540, 0562, 0577, 0587, 0588, 0598, 0605, 0881, 0896, 0899, 0950, 1873, 1940, 1945, 2062, 2143, 2414, 2716, 2723, 2748, 2749, 2755, 2780, 2789, 2791, 2796, 2800, 2819, 2826, 2835, 2851, 2856, 2862, 2869, 2872, 2877, 2879, 2887, 2888, 2889, 3241, 3256, 3478, 3650, 3742, 3833, 3862, 3865, 3872, 3873, 4083, 4156, 4198, 4199, 4209, 4239, 4295, 4434, 4435, 4447, 4465, 4467, 4470, 4489, 4512, 9014, 9034, 9047, 0052S

FOREST SERVICE RESPONSE:

The Forest Service, nationwide, has initiated a new recreation strategy that provides new goals and policies in the management of outdoor recreation programs. This emphasis is responsive to public interest across the nation and agrees with the majority of the comments we received regarding the management of developed sites and areas.

In the development of the alternatives we considered a range of developed recreation sites in all Recreation Opportunity Spectrum (ROS) Classes and a range of developed recreation management emphasis. We have also placed an emphasis on the quality of the recreation setting in the Standards and Guidelines in Chapter IV of the Forest Plan and in the various alternatives as described in Chapter II of the FEIS.

We have planned an extensive Recreation Construction Capital Investment Program for the next decade. (See Appendix A of the Forest Plan.) This program is geared to restore and rehabilitate our deteriorated recreation facilities and improve resource condition at developed sites.

The consequences of the alternatives on the recreation setting and recreation opportunities is explained in Chapter IV of the FEIS.

3 DEVELOPMENT OR EXPANSION OF DOWNHILL SKI AREAS.

COMMENTS INCLUDED:

“Downhill skiing is also highly destructive of forest ecosystems Downhill skiing far exceeds any acceptable level of impact and ought to be kept off public lands.”

“...would like to see alternative of down hill skiing in the Stormy Mountain region included in Final Draft of Forest Plan.”

“I want to go on record supporting expansion of all 3 ski areas to facilitate greater avenues of wholesome winter recreation for our growing population.”

“The alpine ski industry is a clean industry, with very low impact on the environment. It provides a healthy winter recreation with a very low impact on the environment.”

“All ski areas must be fully developed before new sites are considered.”

“It is equally important to include in the final plan, an RE-1 Category recognizing the expansion and development potential of Echo Valley and the Stormy Mountain Ski areas since winter sports help expand our recreation season.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0062, 0582, 0614, 0793, 0834, 2034, 2068, 2097, 2120, 2138, 2734, 2835, 2850, 2968, 2970, 3021, 3023, 3036, 3312, 3316, 3478, 3530, 3556, 3643, 3695, 3748, 3862, 4186, 4295, 4415, 4419, 4434, 4457, 4502

FOREST SERVICE RESPONSE:

The alternatives displayed in Chapter II of the FEIS each contain a discussion concerning expansion or development of new ski areas. The amount of ski area development emphasis is consistent with the emphasis of the specific alternative.

Any expansion outside the present permit boundaries of a ski area requires thorough environmental analysis, usually including an environmental impact statement. Such a document includes detailed analysis of potential environmental impacts, the demand for additional ski capacity, and the benefits to the public.

There is currently no proposal for development of a ski area on Stormy Mountain. In the preferred alternative the land allocations on Stormy Mountain are GF and RE-2a (unroaded motorized recreation). Neither allocation precludes future consideration for a ski area there, however a change in allocation to RE-1 would likely be necessary as part of an EIS.

Recognizing potential for new development, the Alpine Lakes Area Land Management Plan provides direction to manage the Dardenelles Area east of Stevens Pass to retain its potential for future development of an Alpine Ski Area.

4 HOW WILL THE FOREST PLAN ALLOCATE WINTER RECREATIONAL OPPORTUNITIES AND HOW WILL THEY BE MANAGED?

COMMENTS INCLUDED:

“We recommend additional trails for winter sports. The district needs to address the demand of groomed trails for snowmobiles and cross country skiing.”

“We need x-c ski trails which are easy to get to, not too difficult, and are restricted for skiers only. Some forest roads should be closed to ORV’s and snowmobiles for this reason.”

“I saw little attention paid to increased opportunity for winter sports, especially ski touring.”

“Areas set aside for winter, non-motorized use (outside wilderness and RE-3) should be designated.”

“During winter additional campgrounds and parking areas should be made available for snow-oriented recreationists.”

“The Forest Plan is also over-emphasizing snowmobile use over non-motorized use, such as cross-country skiing.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0066, 0363, 0493, 0577, 0587, 0898, 1943, 2097, 2728, 2827, 2885, 2932, 2945, 2958, 3016, 3255, 3333, 3439, 3473, 3700, 3746, 3748, 3873, 3911, 4211, 4264, 4276, 4439, 4440, 4475, 4477, 4493, 4500, 4503

FOREST SERVICE RESPONSE:

The various alternatives place an emphasis on a balance of recreation opportunities evenly distributed across a wide spectrum of natural settings. This balance is as important for winter recreation as it is for summer recreation. The 10 year Capital Investment Program for trails and trailheads includes planned cross-country ski trails and new snoparks.

The needs for cross-country ski trails, snowmobile trails, dog sledding, snow shoeing or general snow play activities are normally addressed in Recreation Composite plans developed for specific recreation areas or major drainages. These plans are prepared at the District level and are coordinated with the known users of the area or other interested organizations, groups, and the general public. Such composite plans generally include an environmental assessment. The plans form the basis for development of specific project proposals.

Specific balances of uses or emphasis of one use over another are issues to be identified and resolved in the Composite plans. The Forest Plan provides the guidance in terms of land allocation.

Winter recreation is compatible with all prescription except EW-1 and partially with EW-3. In EW-1 winter range for big game is the primary emphasis which may preclude some winter recreation activities. In EW-3, which emphasizes unroaded key big game habitat, motorized winter recreation may be affected. Winter logging may impact winter recreation particularly in the GF prescription. However, snow plowing associated with winter logging may also provide access for some types of winter recreation. Winter recreation activities need to be well planned and managed in coordination with relevant management prescriptions. Refer to Chapter IV of the Forest Plan, Management Prescriptions, for a description of the recreational component within various land allocations.

5 WE ARE CONCERNED ABOUT COMMODITY DEVELOPMENTS SUCH AS ROADS AND TIMBER HARVEST AND THEIR IMPACT ON THE TRAILS, THE RECREATION SETTING, AND RECREATION OPPORTUNITIES.

COMMENTS INCLUDED:

“The Wenatchee area deserves the highest degree of protection from road building, ORV’s, and timber cutting.”

“The withdrawing of mineral rights would have a positive effect on the forest, especially recreation.”

“Timber harvest and recreation do not overlap usually. Save some old growth for nature study in special areas (nature trail at picnic ground for example).”

“Rerouting trails around clearcuts is unacceptable.”

“I am particularly concerned about the degradation and elimination of hiking trails through adoption of the ‘Multiple-Use’ concept, which in fact results in sole use by off-road vehicles, and by the expansion of logging operations and logging roads.”

“The difference between resource users is frequently exaggerated. One can and does complement the others. Recreation is a major use of the Forest partly as a result of, not in spite of timber management. Further development of recreation need not come at the expense of timber production.”

“To reduce the conflict between cutting and trails, we would prefer a management policy which would assure that trails which are impacted will be restored and properly marked.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0035, 0036, 0045, 0064, 0150, 0325, 0386, 0390, 0415, 0507, 0520, 0528, 0556, 0579, 0582, 0594, 0612, 0635, 0729, 0745, 0812, 0879, 1939, 2004, 2005, 2017, 2040, 2053, 2094, 2132, 2135, 2475, 2596, 2719, 2723, 2734, 2751, 2767, 2789, 2790, 2791, 2796, 2817, 2835, 2854, 2892, 2919, 2954, 3004, 3057, 3058, 3080, 3146, 3148, 3150, 3160, 3171, 3198, 3208, 3211, 3245, 3246, 3249, 3256, 3260, 3261, 3272, 3282, 3284, 3287, 3323, 3373, 3378, 3396, 3426, 3427, 3466, 3472, 3493, 3518, 3520, 3535, 3590, 3606, 3610, 3611, 3621, 3627, 3648, 3650, 3685, 3712, 3715, 3723, 3766, 3819, 3824, 3862, 3876, 3905, 3914, 4082, 4128, 4141, 4200, 4241, 4257, 4259, 4296, 4410, 4476, 4484, 4491, 4494, 4498, 4503, 4511, 4534, 9003, 9038, 9047, 9074, 9092, 9113, 0029S, 0414S

FOREST SERVICE RESPONSE:

Between the Draft and Final the alternatives have been modified to reflect the importance of recreation and wilderness. The Standards and Guidelines in Chapter IV of the Forest Plan have also been changed to provide greater emphasis on recreation.

The Forest Plan contains management prescriptions with Standards and Guidelines that provide direction for coordination of commodity activities with recreation management. Each prescription, depending on the emphasis of land allocation, has different criteria which guide recreation management within that area. The standards and guidelines also provide direction for the protection of the recreation setting and recreation opportunities. (Refer to the Forest Plan, Chapter IV)

There will be some disturbance of trails by development on the Forest such as timber sale activity. Where trails are involved in a sale area the trails will be either restored to pre-timber sale conditions, relocated or rehabilitated. There will be no loss of trail mileage, however there will be modification of the recreation setting in areas allocated to the GF prescription, which emphasizes timber production.

In all cases, projects will be planned to minimize impacts on recreation resource values.

6 MANAGEMENT POLICY REGARDING RECREATION SPECIAL USE PERMITS.

COMMENTS INCLUDED:

“The DEIS did not address the issue of special use recreation permits.”

“How many guides and how many use days occur so the public can comment.”

“The Alpine Lakes Plan prohibits commercial use (outfitter-guides) from operating in the Enchantments....Our proposal is to allocate 10 percent of the PAOT (currently 6 people at one time) for guided use.”

“I do not like the idea of the campgrounds and recreation areas being contracted out for operation. While it may seem economically desirable, I have seen other areas where the commercialization has destroyed the very experience the people seek in using the forest.”

“I do hope that plans will allow continued use of cabin (recreation residence).”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

FOREST SERVICE RESPONSE:

With the new National Recreation Strategy, recreation special use permits will continue to be a major program for providing recreation activities and opportunities for the public. We see no significant changes in the range of activity or the type of permits that are granted to the private sector for services on the National Forest. This strategy is consistent with the preferred alternative of this Plan.

A part of the emphasis of the new recreation strategy is partnerships. We will be actively seeking out partners to expand the capacity of our funds in meeting recreation demand. A major means in securing partnerships is through special use permits.

The recreation residents permits will continue through the life of this Plan at near the current number.

Outfitter-Guides will continue to provide unique recreating opportunities in a wider range of recreation activities. Outfitter-Guide permits have specific management criteria for operations in wilderness (see Forest Plan, Appendix E). This direction also provides the flexibility necessary for operators to negotiate party size and caching of equipment necessary for their specific operation.

Resorts, organization camps, and club sites will continue to be important developments for public recreation. The Forest Service will encourage partnership with such organizations to develop a cadre of interpretive naturalists Forest-wide to offer tours and interpretive programs to the visiting public.

Proposed recreation development will still require appropriate environmental analysis and will be subject to the site specific requirements of the applicable land management prescription.

7 HAS RECREATION PLANNING ANALYSIS ADEQUATELY ADDRESSED RECREATION SUPPLY AND DEMAND AND ECONOMIC VALUES?

COMMENTS INCLUDED:

“The economic value of recreation and forest amenities is under-estimated, and the potential for economic loss to these sectors is not reported.”

“ROS classifications are not a good indicator of economic values (DEIS II-156) since, except for wilderness, there is no correlation with the budget line items and Forest Service cost and revenues. There is a high probability that ROS use will be abandoned by the Forest Service in the near future due to the limited utility in recreation planning and management.”

“With over 1 million acres of Wilderness and roadless areas under any alternative receiving less than 10% of the total RVD’s clearly shows the supply exceeds the demand for that type of allocation. On the Forest as a whole, the recreation supply exceeds the demand by considerable margin.”

“You have assumed demand for recreation facilities will grow commensurate with population growth. Be aware that recreation demand can and often does exceed population growth and must be anticipated.”

“DEIS page IV-107. The Forest has assumed that the number of recreations visits won’t vary between alternatives. This is wishful thinking used to backup large cutting levels.”

“Level of analysis and accuracy of data - validity of conclusions drawn - doubtful about number of visitor days.”

“The Forest Plan makes the assumption that there is an enormous excess capacity of trails and roadless area on the Forest. This assumption is based on theoretical RVD capacity estimates that work well in a computer but often don’t apply on the ground.”

FOREST SERVICE RESPONSE:

The economic values for recreation are the best figures that are available to us at this time. We are concerned that we use appropriate estimates and will be using research to refine of estimates in the future. Placing a dollar value on recreation opportunities and related amenity values is a difficult endeavor.

The Recreation Opportunity Spectrum (ROS) classes are not indicators of economic value, but are indicators of the recreation opportunities and recreation settings available in the forest. These settings, or the recreation experiences they provide, have economic value. The ROS system of describing the recreation opportunities is increasing in use and application. In the future, there is strong likelihood that ROS classes will be further refined and broken down into subclasses. We are now using the ROS system in wilderness with further breakdown of the Primitive and Semi-Primitive classes into pristine and transition.

The figures for recreation supply and demand have been significantly modified since the Draft (see Chapter II of the Forest Plan). Estimates of growth in recreation visitor use were underestimated when the original projections were made in the period 1982-1984.

The percent of the total of Recreation Visitor Days (RVD's) that occur in wilderness and unroaded areas is not a good measure of the relative value or significance of unroaded and wilderness recreation experiences. What is of significance is the estimated visitor use or demand for recreation opportunities compared to the capacity of the forest to provide those opportunities. For developed recreation, the capacity of 6,700,000 RVD's exceeds the estimated demand of 3,449,300 RVD's. However, for the capacity to be fully utilized, the sites would have to be full seven days a week for the entire managed season. Generally sites are only full on weekends and holiday periods.

The estimated demand for dispersed roaded recreation is far less than the capacity. However, this is not surprising considering the large capacity of the roaded areas of the forest to accommodate road-related recreation.

At this time, we lack the data to know the exact capacity of the forest areas outside of developed recreation sites and areas. Our estimates are based on the Region 6 Recreation Opportunity Spectrum User Guide which contains a user density coefficient that is applied to each acre of a roaded or unroaded area. The density coefficient is an attempt to estimate how many users will recreate in a given area before they find the area too crowded and go elsewhere.

In wilderness, we have shifted away from carrying capacities and are using the limits of acceptable change concept in determining when an area is receiving overuse or unacceptable impact. This does not give us an estimate of the capacity for visitor use. In the future, we will be doing inventories which will help us estimate the people-at-one-time (PAOT) capacity of areas of wilderness. For the present, we are using the density coefficients for undeveloped areas.

Our estimated demand figures take into account new users and population growth. In the future, we hope to account for displaced users who come to this forest from other areas and users who are shifting their activity or setting preferences. There also will be new users introduced to the forest through the development of new technology.

We have assumed that the estimated number of RVD's of use will not change by alternative. This is because there is not a large difference in the recreation allocations and emphasis between alternatives for Developed and Roaded Dispersed Recreation activities which make up 90 percent of the estimated use. Furthermore, there is no variation in wilderness management between alternatives.

8 WILL THE FOREST SERVICE RECEIVE THE RECREATION BUDGET TO REPAIR AND REPLACE FACILITIES, MAINTAIN TRAILS, AND IMPLEMENT THE FOREST PLAN?

COMMENTS INCLUDED:

“Comments on the proposed land and resources management p. 113: Your admission that the potential to expand or develop new developed recreation facilities is affected by budgets is quite revealing. Why does the Forest Service continue to submit budgets to Congress which continually under-budget funds for wildlife, fisheries, trails, and recreation and over-budget funds for timber sales and road construction?”

“We note the Alpine Lakes Management Plan has been incorporated in all DEIS alternatives. We also note that although the plan has been implemented, the Forest's level of funding has not been adequate to realize all the components of the plan. Can we expect this to be true also with the Forest Plan?”

“Sufficient monies should be budgeted to maintain trails, including those in Wilderness Area.”

“I would like to see the Bush Administration promote and support through expanded budgets, recreational uses of our National Forests including improved maintenance of trails, access roads and campsites.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0828, 2201, 2778, 2791, 3255, 3873, 4083, 4468

FOREST SERVICE RESPONSE:

Local recreation budget requests typically exceed the amounts appropriated in the Federal budget. Of course, Congress and the President must balance this appropriation against budget needs for a vast array of other Federal budget needs. Budgets for Forest Service recreation programs have increased in recent years despite reductions in other areas of the Federal budget. We have built a projected budget for each Forest Plan alternative by decade that is our best estimate of the cost of full implementation of the Forest Plan. We can now, probably better than ever before, display to Congress what outputs can be achieved at a specific level of funding. Based on National priorities, we will likely receive some percentage increment less than the full implementation budget with a proportional decrease in outputs.

9 WE ARE CONCERNED ABOUT THE IMPACTS OF RECREATION VISITORS ON FOREST RESOURCES AND OTHER PEOPLE.

COMMENTS INCLUDED:

“The Forest Service would be better off trying to maintain the existing state of the area’s National Forests, as increasing numbers of outdoor recreationists are causing severe nature and wildlife damage itself.”

“All users should pick up what they pack out.”

“We would wish to see the flow of recreational traffic stopped on National Forest lands.”

“Damage is also often apparent from off-road vehicles in sensitive meadows and backcountry places.”

FOREST SERVICE RESPONSE:

The perception of undesirable impact often is in the eye of the beholder. Many long-time forest managers believe that individual users have less impact on the forest environment than they did 10 or 20 years ago. Many users understand minimum impact camping principles and are willing to clean up litter or put out campfires left by others.

Land allocation in the Forest Plan is an attempt to match land capabilities and forest environmental characteristics with appropriate land use. This approach seeks to avoid the incompatibility of high recreation use within critical habitat for a specific wildlife species, for example. Understanding that some impact may accompany human activity, each land allocation has a set of Standards and Guidelines to

direct land managers. These standards set limits on the degree of effect an activity is allowed to generate or prescribes approaches to avoid or mitigate undesirable impacts. (See Chapter IV of the Forest Plan.)

Many social impacts such as noise, dust, litter, and minor user conflicts can be avoided through planning and design of recreation sites and facilities as well as user education. We are working to improve our recreation planning capabilities. Other social impacts may be handled through administrative actions or law enforcement at the local level.

10 HOW WILL CONFLICTS BETWEEN MOTORIZED AND NON-MOTORIZED USERS OF TRAILS BE RESOLVED?

COMMENTS INCLUDED:

“I strongly oppose the proposal to open any trails in roadless to ORV’s. There are no words for the helpless rage and frustration of a hiker blasted off a beautiful and quiet trail, the damage ORV’s do to the fragile vegetation that hikers have been so careful to protect.”

“The Forest Service has not adequately considered the compatibility of ORV use with the environment or with other forest users. Such an omission violates Executive Orders 11644 and 11989 as well as NFMA (36 CFR 219.21(g)).”

“Enforce ORV regulations on motorized trails. Until the FS can insure better enforcement of ORV regulations, no new ORV trails should be constructed.”

“Such short ORV trails dead ending at Wilderness only invite violation of the boundary.....In areas where conflicts exist, such as Mad Lake high country, consideration should be given to development of separate trails to lessen conflict.”

“Most motorcycle riders do not camp up in the fragile mountain areas. They stick to the trails. Camping hikers are the ones responsible for the damage to the environment around favorite camping areas.”

“I would hope that you will take these concerns very seriously as you review the Forest Plan for the Wenatchee National Forest and make sure that whenever there is conflict, ORV use be eliminated so the letter and spirit of Executive Orders 11644 and 11989 can be fully enforced.”

FOREST SERVICE RESPONSE:

We received extensive comment expressing high levels of concern about the user conflicts occurring on the Forest trail system. The majority of these conflicts are between hikers and ORV riders. Due to the magnitude of comment and the complexity of the uses of the trail system, we formulated an Interdisciplinary Team to analyze all aspects of ORV use on the Forest. Their major task was to look closely at the trail system available for ORV use and hiking, study the overlapping interests, and formulate proposals to reduce conflict and address problems identified in the public comments. The results of this analysis and the concurrent evaluation of unroaded areas were merged to form the management direction and unroaded area allocation described in the alternatives in the FEIS.

The most significant opportunity to reduce conflict through the Forest Plan is in allocation of unroaded areas into either RE-2a and 2b, Unroaded Motorized, or RE-3, Unroaded Non-Motorized. Refer to the alternatives in Chapter II of the FEIS. This allocation provides for separation of users on an area basis in some of the more controversial areas.

Also in the FEIS there is a breakout of the miles of trail available for different uses including hiking and motorized use (see Chapter II FEIS). These allocations were made in an effort to provide opportunities for motorized use and hiking in a variety of recreation settings. They also seek to match the designated use to other resource values of the immediate area and reduce user conflicts. Several changes were made to balance use. Some compromises are necessary by both hikers and motorized user.

We recognize that over the past 10 years emphasis has been placed on the improvement of multi-purpose trails open to trail bikes. For the next 10 years we will place emphasis on expanding trail opportunities for the non-motorized user. The Plan calls for the construction of more than 400 miles of new trail outside wilderness, most for non-motorized use. Of this, about 125 miles of construction is planned for multi-purpose trails open to trail bikes. This will be designed to provide loop trail opportunities and allow for separation of user groups. The new construction is expected to help reduce user conflict.

Outside of the Forest Plan allocations, user conflicts will be resolved through user education, monitoring of use and conflicts, and administration and enforcement of regulations at the Ranger District level. Increased patrols by back-country rangers are one example of increased administration.

11 HOW MANY MILES OF TRAIL WILL BE AVAILABLE FOR VARIOUS USER GROUPS SUCH AS HIKERS, HORSES, ATV, ORV, MTN. BIKES, AND 4X4'S?

COMMENTS INCLUDED:

"Please preserve and expand ORV use in the WNF. Our family recently entered the sport of 2 wheel ORV recreation. We find it very family oriented."

"I favor maintaining all existing trails for future use and not closing any trails for stock."

"I am concerned about the possibility of loss of hiking trails without plans for replacement. There is a need to maintain a good trail network for non-motorized users."

"Non-motorized recreationists need lower elevation areas so that they can hike, etc. most of the year."

"New trails should be built for livestock usage....."

"One of the best new concepts to be developed lately is the idea of hiking areas."

"In my opinion as an occasional backpacker: Horses are very destructive to trails and to meadow areas where they are grazed and bedded. It is an obnoxious nuisance to have to dodge their excrement as well as smell it on the trail"

"The Draft Plan, page IV-9, states that areas for the ATV type vehicle will be developed, yet nowhere in the document is it mentioned when and where such developments will take place...."

FOREST SERVICE RESPONSE:

The Interdisciplinary (ID) Team that was formulated to analyze ORV use on the Forest did a thorough analysis of the trail system as a whole. With involvement of representatives from each Ranger District, the ID Team made some changes in management objectives and trail use allocations. This new emphasis was responsive to public input and is the Team's best effort to formulate an equitably balanced trail system with outstanding opportunities for all users.

In the description of each alternative in Chapter II of the FEIS is a table showing the miles of trail available to motorized use by land allocation and the miles of trail administratively closed to motorized use. These figures are changed from the Draft EIS and are a result of the ID team analysis.

Appendix C of the FEIS, Roadless Areas, also contains an analysis and further breakdown of the trail system in unroaded areas. For information regarding uses of trails in wilderness refer to Chapter IV of the Forest Plan and Appendix E of the FEIS, Wilderness Management.

About 211 miles of the trail open to use by hikers, horses, and motorcycles have been constructed or reconstructed in past years with tread hardening and turnpiking for use by trail bikes. These trails are very popular with motorcycle riders. Although these trails are available to hikers or horseback riders, those who object to periodic trail bike encounters may wish to choose other trails.

In addition to this trail system, there are about 100 miles of trail which have been built specifically for 4x4 vehicles and are open to ATV's. These trails are not well-suited to other uses.

We have no specific proposals for ATV use opportunities although we are open to suggestions and proposed routes. We know there is interest from the public.

12 MAINTENANCE AND OPERATION OF TRAILS AND TRAILHEADS.

COMMENTS INCLUDED:

“Public maintenance of trails should be encouraged to offset revenue loss.”

“The idea of connecting trails together to form loops is very important. But the money that's being spent on cinder-blocks is really appalling.”

“Trail maintenance work must also be increased on existing trails.”

“More signs should be placed, particularly at intersections of trails.”

“That primitive toilets be placed every so often off trails.”

“Why not provide the most primitive crossings on a foot log accommodating hikers but not pack animals.”

FOREST SERVICE RESPONSE:

The operation and maintenance of trails and trailheads is a project level function not considered in Forest planning. Trail maintenance standards are established in Forest Service Manuals and Handbooks. Operational procedures or use of volunteers come under the administration of the Ranger Districts. However, we have passed comments received on to the Ranger Districts for their use and considerations. Public comment is very helpful in the design of trailheads and the facilities we provide for public use.

13 WHAT CAN BE DONE ABOUT TRAILHEAD VANDALISM AND VEHICLE BREAK-INS?

COMMENTS INCLUDED:

“We need better and more protected trailhead parking to help stop vandalism of parked vehicles. (Maybe a pay system of some kind to help post a guard.)”

“Trailhead vandalism and theft remain a major problem in the Wenatchee National Forest as elsewhere. This problem should be addressed in any comprehensive management plan of our forest. I believe one way to deal with this is to build campgrounds at all trailheads.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0094, 2775, 2945, 4408

FOREST SERVICE RESPONSE:

Vandalism and break-ins at trailheads is a problem that concerns us a great deal. However, this topic is outside the scope of the Forest Plan which is focused on land allocation and land management Standards and Guidelines. We have passed your comments and suggestions on to the Ranger Districts for their considerations.

There are many trailheads on the Forest at locations which would appear to be marginal locations for campgrounds. Levels of use at many trailheads, especially mid-week, probably would not be sufficient to pay a guard. However, these are creative ideas which may have use at some locations. In the short term, the best advice is to leave nothing of value in vehicles and to report vehicle license numbers of trailhead visitors behaving suspiciously.

14 COMMENTS RELATING TO THE MANAGEMENT OF ROADS FOR RECREATION.

COMMENTS INCLUDED:

“On my many trips into the Entiat Valley this summer I always saw cars parked on the narrow road while its occupants were fishing. In nearly all cases there was a closed access road nearby. Open them.”

“The maps provided do not permit us to match up following sites and road access to the areas we are interested in. We need to know what roads are likely to be closed and what new ones are proposed.”

“There are enough miles of backcountry roads in the WNF to choke a horse - God, its a messy spider web in areas when viewed from the air.”

“Many roads are now closed to entry by locked gates and water bars in the roads. Areas once open to berry picking, mushroom hunting, and rock collecting are now closed. For many senior citizens this is their only recreation to get in the woods for outings. Just keep existing roads open.”

“If roads are built, keep hunters out in using bikes or any kind of travel except by foot.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0040, 0062, 0508, 0543, 0670, 1841, 2124, 2180, 2748, 2751, 2796, 2885, 3146, 3659, 3742, 3868, 4390, 4406, 9074

FOREST SERVICE RESPONSE:

Most forest roads are constructed for timber harvest activity. A few roads have been constructed to improve recreation access. Once roads are constructed and become part of the managed system they are analyzed for their best future use and the potential impacts they may have on management of other forest resources. Many roads are closed after timber haul is completed. Roads that can provide valuable access for the public with little negative consequence are left open for use.

Roads that receive moderate to heavy use require annual maintenance, which is extremely expensive. Road maintenance funds are limited so the maintained road system must be managed carefully. Roads that are used and not maintained constitute resource management problems, for they are subject to soil erosion, plugged culverts and washouts. This could lead to increased sediment in streams and future soil and water concerns.

High public use in some areas has adverse effect on wildlife and can result in big game escapement problems during hunting seasons. Hunting quality frequently is better when some road networks are closed to vehicle access.

The present road system is generally adequate for public access to the Forest. Most of the roads constructed in the future will be closed. The miles of open road and miles of new construction is described by alternative in Chapter II of the FEIS.

15 MANAGEMENT OF THE MATHER MEMORIAL PARKWAY.

COMMENTS INCLUDED:

“Development other than dispersed recreation near this primary park entrance should be limited to ST-1 prescription, which calls for retention of the visual quality objective and for retention or enhancement of the viewing and recreation experiences along scenic travel routes.”

“No logging should be allowed on the Mather Parkway as it would mar the scenic beauty of the entrance way to Mt. Rainier National Park.”

“Somewhere in the planning process should be a unified agreement for management of Mather Memorial Parkway.”

“Alternate F should be modified to prohibit construction of Naches Pass road, provide protection to the Mather Parkway from logging and reduce grazing.”

FOREST SERVICE RESPONSE:

Due to the extensive public response relating to the management of the Mather Memorial Parkway, we have established a specific prescription (MP-1) for the parkway (See Chapter IV, Management Prescription, of the Forest Plan).

The following is a summary of the prescribed management:

- Visual quality objectives will be retention and preservation.
- Emphasis on high quality recreation facilities.
- Livestock grazing will be consistent with visual quality objectives.
- There will be no scheduled timber harvesting within the areas visible from the highway.
- No silvicultural practices will be undertaken in areas visible from the highway.
- Fire suppression strategies will emphasize the protection of recreation facilities and visual resources.

The management objective for the parkway is to maintain the high visual qualities and recreation setting that is appropriate for managing a gateway to a National Park.

ROADLESS AREAS

16 ALLOCATION OF ROADLESS AREAS OUTSIDE WILDERNESS.

COMMENTS INCLUDED:

“I urge that all roadless areas and old-growth forest be retained intact ”

“I feel that we already have a great deal of country reserved for our future enjoyment through wilderness areas. I can't justify locking up all the remaining areas for 'unroaded' use, nor can I agree to give everything away to ORV and logging.”

“It is my opinion that the Washington Wilderness Legislation of 1984 resolved the roadless area question for the Wenatchee. Therefore, there should not be any land allocation made to roadless non-motorized recreation or to roadless motorized recreation with the exclusion of timber harvesting or other consumptive resource use.”

“Develop the roadless areas within the just two decades to bring those (areas) under management.”

“While some places may be less spectacular than wilderness, they enjoy longer use seasons and are often appropriate for handling larger groups like horse packers, scout troopers, etc.”

“I would like to see more ORV development in nonroaded areas. By developing more areas, the impact on any one area would be reduced.”

“More roadless area should be open to multi-use recreation.”

FOREST SERVICE RESPONSE:

The unroaded areas of the Forest received extensive public interest and comment. Opinion ranged from the extremes of “keep all present unroaded areas roadless”, to “allocate all unroaded areas to multiple use”. The response was so varied and extensive that a special interdisciplinary team was formed to evaluate the public comments and further examine the unroaded areas and their land use potentials.

The analysis of the roadless areas resulted in changes in the allocation of unroaded areas for all alternatives. Public input played an important role in these changes. The allocation by alternative is contained in the alternative section, Chapter II of the FEIS. Appendix C, Roadless Areas, contains a description and analysis of each individual unroaded area.

The changes were designed to meet the overall expressed public desire for more area to be retained for roadless attributes, with emphasis on the areas that received considerable interest and comment. This was done with considerable effort to balance the need for roadless recreation opportunity with the other demands for timber harvest, other commodity use, and roaded recreation opportunities.

17 MANAGEMENT OF AREAS BEING RETAINED IN UNROADED CONDITION.

COMMENTS INCLUDED:

“I would support all roadless areas and old-growth forest be retained intact and oppose any increase in livestock grazing.”

“Don’t build roads into roadless areas.”

“No more than 1/3 of unroaded forest should be opened to vehicles.”

“We would like to express our strong belief that all existing roadless areas and old growth forests be retained intact. These areas need to be protected in the areas wildlife habitat, watershed quality and fish habitat.”

“I would like to have all of the roadless areas outside of wilderness open for trailbike use.”

FOREST SERVICE RESPONSE:

The management of areas to be retained in unroaded condition received a great deal of public comment. Much of the comment dealt with the issue of motorized versus non-motorized recreation. The Interdisciplinary Team analyzing the allocation of unroaded areas also addressed the use of these areas. The large volume of public comment was again a strong factor in the decision process.

Future management of unroaded areas will be guided by the application of a management prescription (RE-2a, RE-2b, RE-3, RE-4, EW-3, SI-1) to portions or all of an individual roadless area. Each of these unroaded prescriptions has a management emphasis or use emphasis. The allocation by alternatives is located in Chapter II of the FEIS. The Standards and Guidelines in Chapter IV of the Forest Plan provide specific direction for the management of areas under the prescriptions.

The allocations by alternative are the result of the ID team analysis and are our best effort to retain areas with high value and public interest in an unroaded condition while at the same time providing for multiple use on portions of unroaded areas with high value for commodity production. The RE-4 prescription is an attempt to provide a high quality semi-primitive recreation setting while still making allowance for some timber harvest on high production growing sites. The prescribed small-size harvest units and aerial logging systems should avoid most recreation impacts in areas allocated to RE-4. There will be no road construction allowed in this prescription.

18 COMMENTS RELATING TO THE LAKE CHELAN SCENIC AREA.

COMMENTS INCLUDED:

“Why has the full Lake Chelan Scenic area proposal from the Chelan Planning Unit (CPU) not been carried intact into the Forest Plan.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

3062, 3621, 9094

FOREST SERVICE RESPONSE:

Since the original proposals for a Lake Chelan Scenic Area, many factors have changed in the management of the area. There also has been a change in land managers assigned to the area which brings change in perspective and management philosophy. The designation of the Lake Chelan Sawtooth Wilderness was a significant factor in the establishment and protection of recreation and visual qualities of the area. It is believed the establishment of a Scenic Area now would not afford any more specific protection of the area than is provided by the preferred alternative of the Forest Plan. The preferred alternative keeps virtually all of the unroaded land adjacent to upper Lake Chelan in an unroaded state.

19 WHICH UNROADED AREAS WILL BE ALLOCATED FOR MOTORIZED RECREATION USE?

COMMENTS INCLUDED:

“The Draft Plan severely degrades the quality of hiking trails in the Wenatchee by losing 50 miles, rerouting many others, and allowing use of most trails by ORV’s. The Mad River, North Fork Entiat, Chelan-Gold Creek, and Teanaway should be designated as hiking areas.”

“I would like to have all the roadless area outside of wilderness open for trailbike use and want to ask that the following areas remain open for fishing, camping, trailriding, and sightseeing: Sawtooth area, North Fork Entiat area, Mad River, Naneum-Devil’s Gulch, Teanaway-Negro-Shaser, Chelan North, Myrtle Lake, Stormy Mt., Taneum, Thorp, Mt. Tronsen.”

“While an RE-3 designation for all roadless areas would safeguard hikers and horses, it would eliminate motorcycles on some trails that have little conflict and such an area-wide designation is not needed.”

“Maintaining maximum availability of roadless areas for trail bike use. N. Chelan, Boiling, and Cub Lakes. Two of twelve fishable lakes open to trailbikes in the State.”

FOREST SERVICE RESPONSE:

We received extensive comments concerning the allocation of unroaded areas and motorized versus non-motorized use. The ID Teams assigned to analysis of roadless areas and trails reviewed public comments, considered the attributes of each area and trail system, and made recommendations to the Forest Management Team. The allocation of areas to remain roadless and the mix of use in an area is designed to best fit the suitability of the land and the expressed public desires for the area. See Chapter II and Appendix C of the FEIS for the motorized allocation for each roadless area.

The final decision is not likely to completely satisfy advocates of either non-motorized nor motorized recreation. However, we believe it to be an equitable allocation with much to offer all users. Proposed new trail construction offers exciting new opportunities for all. However, the key to resolution of conflict on shared trails is education of users in minimum impact principles, courtesy, and understanding others. See the Record of Decision for a discussion of steps taken to reduce trail user conflicts.

WILDERNESS

20 COMMENTS RELATING TO WILDERNESS BUFFER AREAS.

COMMENTS INCLUDED:

“The designated Wilderness areas must have a protected buffer zone around them. It is extremely irresponsible to propose clear cutting up to wilderness boundaries.”

“The Wilderness boundaries should be bordered by roaded areas whenever possible and motorized recreation should be allowed on all old logging and skid trails.”

“Vehicle use designation of trails in areas adjacent to Wilderness boundaries not only causes inappropriate levels of noise and even drifting exhaust in the adjacent Wilderness areas, thus violating the purpose of Wilderness designation, but also encourages motorized recreationists to violate Wilderness boundaries and ride vehicles into Wilderness areas.”

“The Wenatchee Forest should place greater emphasis on developed and accessible dispersed recreation. Buffer zones around Wilderness should be eliminated to comply with Section 9 of the Washington State Wilderness Act.”

“We definitely oppose running roads right up to wilderness boundaries. There should be a buffer zone.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0062, 0141, 0150, 0344, 0497, 0521, 0579, 0586, 0590, 0605, 0618, 0792, 0793, 0896, 0901, 2000, 2032, 2053, 2058, 2137, 2398, 2734, 2739, 2750, 2768, 2779, 2791, 2796, 2810, 2826, 2832, 2842, 2846, 2868, 2877, 2882, 2887, 2916, 2920, 2934, 2941, 2946, 2958, 2959, 2962, 2968, 2995, 2996, 3012, 3030, 3033, 3085, 3116, 3134, 3164, 3171, 3241, 3251, 3253, 3256, 3290, 3392, 3394, 3462, 3492, 3493, 3509, 3520, 3551, 3553, 3573, 3621, 3672, 3727, 3742, 3771, 3820, 3834, 3871, 3876, 3877, 3903, 3926, 3992, 4027, 4036, 4094, 4269, 4312, 4400, 4434, 4439, 4448, 4454, 4468, 4470, 4489, 4494, 4494, 4498, 4511, 9041, 9094, 1578S

FOREST SERVICE RESPONSE:

The intent of Congress regarding buffer strips around wilderness was described in Section 9 of the Washington State Wilderness Act of 1984. “The fact that non-wilderness activities or use can be seen or heard from areas within wilderness shall not, of itself, preclude such activities up to the boundary of the wilderness area”. However, the public has expressed, over a number of years, the desire for maintaining a more natural appearing environment and a high quality recreation setting as visitors approach back country and wilderness on the primary travel routes and access to wilderness.

The way we have to accomplish this objective, where it is desirable, is the Recreation Opportunity Spectrum System. The six ROS classes range from highly developed to primitive which also is very similar to the transition a visitor experiences when traveling into the Forest toward more remote areas. As a visitor travels into the Forest, there is generally less development, decreasing road standards, more rustic and primitive facilities and finally, wilderness. The natural characteristics of the topography, vegetative composition and site capabilities for commodity production generally follow this same transition from the low country to the higher elevations. Sensitive management can encourage this transition. This is the general management framework we are emphasizing when unroaded area land allocations are retained adjacent to wilderness, or when trails that had to lead to wilderness are closed to motorized use. Refer to Chapter II of the FEIS for land allocation by alternative.

21 COMMENTS RELATING TO USE LEVELS AND CARRYING CAPACITY OF WILDERNESS.

COMMENTS INCLUDED:

“Some safeguards are needed to control the amount of usage of fragile ecosystems, but this control should be based on carrying capacity of the land (or water), not some planner prescribing a preconceived notion of ‘solitude’. We feel the ‘Prescription Solitude’ is unnecessary and silly and should be eliminated.”

“I think you need stronger language saying that if carrying capacity is exceeded you will through a variety of devices reduce use, to, at, or below the carrying capacity.”

“How is the carrying capacity of a Wilderness determined? This would affect both the ability to protect the Wilderness resource and the estimation of future adequacy of Wilderness to meet recreational pursuits. However this says nothing of the capacity of the Wilderness acreage and spatial arrangement to meet the needs of wildlife and other dependent resources.”

“A more satisfactory carrying capacity needs to be established for regularly established climbing routes. Access routes which are also used as day hikes and backpacking trips need to be given special attention. The Forest Service’s emphasis on solitude in the Wilderness may not be a reflection of the visitors Wilderness values. Physical and mental challenge, scientific study, inspiration, and primitive recreation may be equally or more important on a particular recreation experience.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0150, 0579, 0582, 2132, 2749, 2832, 2877, 2968, 3085, 3202, 3203, 3229, 3233, 3371, 3522, 3621, 3725, 3746, 3776, 3873, 3879, 3903, 4485, 4493, 4499

FOREST SERVICE RESPONSE:

The concept of carrying capacity has been replaced with the Limits of Acceptable Change (LAC) system in the final Forest Plan. Rather than focus on the maximum number of people an area can support before resource impacts occur, we are now focusing on how much physical, biological and social change can occur before wilderness values are degraded, without trying to determine how many people can use the area. Under the LAC system, we have established standards to specify the amount of impact that may occur before management actions are implemented to reduce the impact. These actions are designed to change the way an area is used and/or the number of people who visit there.

The LAC standards for the social setting and the wilderness recreation experience are the most difficult to quantify. For what is solitude to one person may not be solitude to another. Some users of wilderness don’t care if they experience solitude or not. The important factor is that wilderness was created as a place people would have an extremely high probability of experiencing isolation and solitude. Based on our interpretation of the Wilderness Act, we have set LAC standards for social resources at levels which guarantee solitude can be experienced. We understand that some users believe our standards are too restrictive. We believe this restrictiveness was built into the Wilderness Act and until the law is changed, we expect to continue this management approach. Any changes in the law would have to be made nationally, hopefully with input from all users of wilderness. See Appendix E of the Forest Plan for more detailed discussion of wilderness management concepts.

22 ACTIVITIES, USES AND FACILITIES WHICH MAY BE INCOMPATIBLE WITH WILDERNESS.

COMMENTS INCLUDED:

“Chain saws should be allowed in Wilderness to speedily clear trails.”

“I think it is a crime to tear down old shelters and lookouts just because somebody feels there is not enough money to maintain them.”

“Early buck hunting should not be allowed in Wilderness areas because it conflicts with the Wilderness Act guidelines.”

“Apropos the jets: Are you afraid to tangle with the military establishment? The jets are illegal here and elsewhere over the Cascades. You know it; we know it; everybody knows it.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0005, 0062, 0582, 0605, 1947, 2722, 2775, 2832, 2962, 3374, 3862, 3873, 4263, 4468, 4477, 4498

FOREST SERVICE RESPONSE:

Federal regulations prohibit the possession or use of mechanized equipment in wilderness. This regulation applies to the Forest Service as well as the public. The Secretary of Agriculture has authorized the use of mechanized and motorized equipment for emergency purposes such as threats to life and private property. Fire suppression Search and Rescue and some law enforcement are such situations. There are allowances in the Wilderness Act for continuation of specified prior existing rights. Use of mechanized equipment may be approved if reasonably necessary to carry out those rights. On rare occasions helicopters can be approved if there is no other feasible way to get a job done, such as flying full toilet vaults out of the Enchantments area of the Alpine Lakes Wilderness. Other work, including trail maintenance, will be done by primitive means to avoid impacts on wilderness visitors. Primitive means will be used even if shown to be more costly.

The purpose and need of temporary structures and facilities is generally to meet wilderness management objectives. There are to be no permanent structure in wilderness (See Appendix E, Wilderness Management, of the Forest Plan). However, old buildings and lookouts that qualify as cultural resources can be preserved and maintained for as long as they last if they are significant to the history of the area and if proper Cultural Resource Management procedures are followed. They may also be removed if they present management problems such as occupancy trespass, vandalism, or safety hazard to visitors.

The Forest Service is currently working with the Department of Defense to solve the problems of low level military overflights of wilderness. The military believes, these flights are highly important to pilot training and are critical to National Security. We are hoping we can influence where and when these flights occur.

23 WILDERNESS PLANNING AND MANAGEMENT.

COMMENTS INCLUDED:

“Page IV-3, Wilderness, 4. What kinds of facilities are to be developed? This goal appears to conflict with goal 20, page IV-5.”

“I notice that limitations are going to be put into effect in the Enchantments which I think is a good move, and overdue.”

“More education on Wilderness ethics and minimum impact camping is highly desirable for the good of the Wilderness.”

“Volunteers are great, but the increasing reliance on volunteers moves the Forest Service further from accepting their duty to manage.”

“You should enact a user fee system for both Wilderness users and vehicle road use.”

“Finally, with regard to the Wilderness Management Plan, I would like to emphasize that current limitation on pack stock and size of horse parties should be continued. A strong program for dedicated trailless areas within Wilderness should be continued.”

“Pets should not be permitted in Wilderness areas.”

“I’m concerned about not taking initial action on wild fires within the Wilderness areas. The impact on air pollution, damage to headwaters and watersheds, and mass soil movement and wildlife habitat should be logical reasons enough for any prudent, responsible resource manager to change this poorly conceived idea.”

“Other items of concern include the restrictions of numbers of people and animals per party traveling in the Wilderness areas. Is there a need for these restrictions and is this the only and best way to solve the ‘overuse’.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0001, 0018, 0020, 0021, 0049, 0062, 0067, 0127, 0150, 0360, 0385, 0561, 0579, 0582, 0587, 0602, 0605, 0718, 0793, 1588, 1937, 1947, 1959, 1973, 1997, 2004, 2053, 2076, 2132, 2714, 2719, 2725, 2749, 2751, 2760, 2768, 2807, 2832, 2868, 2879, 2888, 2936, 2939, 2996, 3007, 3233, 3239, 3256, 3277, 3374, 3446, 3491, 3495, 3522, 3548, 3588, 3611, 3621, 3679, 3746, 3776, 3849, 3862, 3864, 3873, 3879, 3932, 3988, 4125, 4200, 4298, 4425, 4433, 4448, 4477, 4493, 4498, 4499, 4503, 4511, 9022, 9026, 9092, 9104

FOREST SERVICE RESPONSE:

The section of the Forest Plan which provides direction, Standards and Guidelines, for wilderness management has been substantially rewritten and expanded (See Chapter IV and Appendix E of the Forest Plan). All public responses have been well addressed. We have greatly increased the explanation of management actions and procedures in wilderness management.

We have instituted the Limits of Acceptable Change system to assure wilderness degradation does not occur, or that management actions are implemented to stop a downward trend in resource condition.

We have changed our Wilderness Recreation Opportunity Spectrum (WROS) classes to pristine, primitive, semi-primitive and transition, to better describe the recreation setting and resource conditions in wilderness. We have provided more detailed descriptions of the standards for physical, biological, or social resource values we are striving to maintain in each WROS class.

We are managing to allow natural processes, such as fire, insects and diseases and natural plant succession to occur without the influence of human interference.

The key factor to keep in mind in wilderness management is that recreation is an appropriate use of wilderness, but wilderness was not designated solely as a recreation areas. Wilderness is managed so that it will not be degraded as wilderness, and so that its natural ecosystems will be preserved.

24 HOW MUCH WILDERNESS SHOULD WE HAVE?

COMMENTS INCLUDED:

“First, I’d like to see you headed towards a direction that would label everything over 4000 ft. in elevation ‘Wilderness’.”

“We are very concerned about the loss of more and more of our precious Wilderness areas to logging sales.”

“As our population continues to grow, and as an increasing higher percentage of it pursues outdoor recreational activity, it is critical that we preserve those Wilderness areas that are still left in their natural state.”

“I think there will be too many jobs lost and our taxes raised too much to allow for more Wilderness areas.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0017, 0047, 0066, 0147, 0198, 0271, 0292, 0400, 0407, 0418, 0541, 0573, 0579, 0718, 0742, 0792, 0823, 0825, 0997, 1027, 1033, 1063, 1069, 1091, 1125, 1127, 1255, 1299, 1328, 1361, 1502, 1582, 3633, 1652, 1658, 1664, 1679, 1697, 1762, 1763, 1956, 1970, 1973, 1997, 1998, 2053, 2076, 2137, 2144, 2181, 2201, 2242, 2353, 2380, 2474, 2544, 2573, 2611, 2768, 2777, 2780, 2789, 2845, 2882, 2887, 2905, 2924, 2927, 3007, 3065, 3134, 3139, 3239, 3244, 3245, 3269, 3270, 3374, 3394, 3400, 3433, 3437, 3551, 3553, 3615, 3712, 3718, 3732, 3740, 3743, 3811, 3873, 3876, 3914, 3956, 3958, 4098, 4118, 4142, 4239, 4263, 4380, 4412, 4416, 4422, 4425, 4448, 4467, 4477, 4484, 4489, 9013, 9014, 9028, 9030, 9047, 9097, 1200S

FOREST SERVICE RESPONSE:

The areas remaining unroaded following the Wilderness Act of 1964 and the Alpine Lakes Wilderness Act of 1976, have been through several stages of analysis for their suitability as wilderness. This analysis culminated, for the present, with the Washington Wilderness Act of 1984 (See section 2 Washington State Wilderness Act of 1984). The passage of this act also established that the Secretary of Agriculture shall not be required to review the suitability of released lands until revision of the current Forest Plans. From that point, the wilderness option will be considered every 10 to 15 years (See Section 5 Washington Wilderness Act of 1984).

For each alternative a specific number of acres will be retained in an unroaded condition at the end of the first, second and fifth decade. See Chapter II of the FEIS. During the next round of planning, in 10 to 15 years, the areas still in unroaded condition may be considered for wilderness designation.

SCENERY

25 MORE CONSIDERATION SHOULD BE GIVEN TO SCENIC QUALITIES.

COMMENTS INCLUDED:

“Nearly all of the timber base (lands are) to be managed with low emphasis on visual quality--especially in recreation corridors that are wilderness portals also (e.g. Entiat, Chiwawa Rivers). These portals and recreation roads are supposed to be sensitive travel routes, and should be managed to at least meet a VQO of PR (partial retention)--but this alternative [B] violates policy and Forest Service manual direction, and guidelines in the visual management handbook (Ch. 5-Timber).”

“DEIS P. II-124. Qualitative resource outputs. Reducing visual character in preferred Alternative C is not acceptable. Alternatives E and F are much more reasonable in maintaining this visual character that is so prized by so many.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0010, 0017, 0035, 0049, 0061, 0067, 0069, 0147, 0305, 0432, 0577, 0587, 0730, 1939, 1981, 2134, 2138, 2201, 2720, 2732, 2780, 2789, 2791, 2808, 2832, 2845, 2849, 2854, 2855, 2879, 2914, 2927, 2928, 2930, 2955, 2963, 2968, 3031, 3044, 3057, 3081, 3085, 3173, 3177, 3185, 3209, 3228, 3246, 3325, 3333, 3363, 3377, 3394, 3495, 3520, 3529, 3531, 3535, 3593, 3616, 3621, 3624, 3627, 3690, 3691, 3742, 3803, 3862, 3871, 3911, 4081, 4160, 4205, 4210, 4273, 4298, 4447, 4450, 4471, 4489, 4490, 4496, 4497, 4498, 4501, 4510, 9066, 9097

FOREST SERVICE RESPONSE:

The visual resource management system was developed by the Forest Service nationally to recognize the scenic attractions and areas of high concern for scenic quality. In recognition of the concern for scenic quality on the Wenatchee Forest, 34 viewsheds and 19 lakes have been recognized as travel routes and places for travelers to enjoy the natural forest environment and scenic quality. Visual Quality Objectives have been developed and applied to all management prescriptions. Depending on the specific location and land allocation, Visual Quality Objectives provide for a range of scenic values from low to high visual quality.

Major scenic attractions, key viewsheds and important lakes will have a high visual quality allocation, while in other areas of the managed forest the natural landscape will be modified. But, in all cases, the visual resource management system will be applied to the design of management activities on all lands to provide the highest possible visual quality. See Chapter IV of the Forest Plan for further details on landscape management requirements.

26 WHY DO TRAVEL ROUTES WITHIN THE VIEWSHEDS VARY IN THEIR VISUAL QUALITY, ESPECIALLY IN SIGNIFICANT SCENIC AREAS?

COMMENTS INCLUDED:

“It is with grief that I read that a Forest Service analysis predicts that the timber industry’s alternative would result in a reduction in scenic quality of the Swauk Pass corridor. Prediction holds true for all 20 scenic corridors inventoried in the Plan.”

“Some parts of the lands allocations adjacent to the Alpine Lakes Plan is not integrated to protect scenic travel ST-1 or ST-2. The tie between Table Mountain road corridor to Highway 97 is an example for the final land allocation.”

“We have previously addressed the fact that the WNF cannot cover up the I-90 corridor scar with verbiage such as ‘all major travel routes and lakes are protected.’”

“Alternative C-the effects of this alternative on visual quality are not as fully described in Appendix C (e.g. Alternatives A, H, B and D are more fully described.) For C and I it often says ‘will allocate many areas to ...’ What’s many, more than half?”

“Views from trails, the south fork Tieton, and the view from Goat Rocks...The middle ground view from White Pass...as viewed across Rimrock Lake will have slightly altered to some altered visual condition. These are viewsheds of utmost scenic importance. They must be protected.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0095, 0552, 0587, 0900, 1947, 2134, 2201, 2720, 2963, 3085, 3138, 3437, 3440, 3593, 3621, 3865, 3866, 3876, 4081, 4273, 4490

FOREST SERVICE RESPONSE:

Major travel routes, encompassing 24 of the 34 identified viewsheds, will be managed to maintain high visual quality. Highly scenic areas have been reassessed along with other resource values to ensure scenic protection. Examples of areas with high visual sensitivity are the Highway 410 viewshed and the lower Lake Chelan viewshed. These areas will have high visual protection. In other viewsheds management can emphasize other resource values such as wildlife or timber management and still provide moderate to high visual quality. Some places within the viewshed may be altered to provide for these higher overriding land uses. The wildlife prescription, EW-1, is an example of an area where the main emphasis will be placed on management of wildlife habitat rather than on maintenance of a natural scenic setting. A range of visual quality can be expected in such an area. Ten of the viewsheds will have parts of the foreground and middleground in an altered scenic condition. Refer to Chapter IV of the FEIS for a discussion of each alternatives effects on visual quality.

In areas of mixed ownership such as Snoqualmie Pass, private land management is likely to alter the landscape. Private land management can produce an altered landscape even though the Forest Service goal is to maintain the highest possible visual quality in a given scenic viewshed.

27 WILL SCENIC CORRIDORS, BOTH FOREGROUND AND MIDDLEGROUND, AS WELL AS SCENIC VIEWPOINTS BE PROTECTED AND MAINTAINED?

COMMENTS INCLUDED:

“The I-90 corridor from Snoqualmie Pass east through the Wenatchee National Forest is currently a national disgrace, a major eyesore...an example of clearcutting and desecration at its worst and a corridor of the lowest visual quality.”

“I like the percentage cut idea per decade in the entire viewshed, but still don’t believe it is applied adequately to the middle and background area as the visual planning system suggests.”

“It appears that most scenic corridors have 1/4 to 1/2 mile wide swaths to be managed for retention in the foreground but the middle and background areas are not visually managed.”

“Are the prescriptions (or Forest regulations) clear on how managers are to meet this scenic goal, what constitutes foreground, middleground, acceptable alteration, etc?”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0035, 0049, 0061, 0069, 0147, 0152, 0432, 0562, 0570, 0577, 0590, 0744, 1981, 1999, 2134, 2138, 2201, 2257, 2734, 2772, 2779, 2783, 2789, 2791, 2832, 2845, 2849, 2854, 2855, 2866, 2879, 2912, 2914, 3080, 3081, 3085, 3103, 3105, 3109, 3177, 3209, 3246, 3291, 3318, 3325, 3363, 3377, 3394, 3429, 3440, 3493, 3576, 3593, 3616, 3624, 3627, 3689, 3690, 3742, 3749, 3862, 3876, 4069, 4080, 4081, 4273, 4447, 4491, 4493, 4494, 4496, 4498, 4501, 4510, 4534

FOREST SERVICE RESPONSE:

Scenic travel corridors and viewshed will be managed for scenic quality. The foreground (up to 1/2 mile) and the middleground (1/2 to 5 miles or a logical topographic break) are the areas considered from a roadside. In any given scenic travel route, the foreground will be managed to maintain scenic qualities. The management of the middleground depends on the specific travel route and the importance of the middleground view as it contributes to scenic quality. In some cases wildlife values will prevail over scenic considerations.

Maintenance of visual quality will be given high consideration on most travel routes. The exception is where intermingled ownership lands, such as in the Snoqualmie Pass corridor, are highly visible to the traveler. Forest lands within intermingled ownership will be managed to provide the highest possible aesthetic qualities.

Past experience, landscape management handbooks, the Standards and Guidelines in Chapter IV of the Forest Plan, and interdisciplinary teams including design arts specialists, will be integrated into project planning to achieve a blending of management activities on the landscape.

28 MAINTAINING VISUAL QUALITY WITHIN SCENIC VIEWSHEDS WHERE INTERMINGLED OWNERSHIP PATTERNS EXIST.

COMMENTS INCLUDED:

“Checkerboard ownership within the National Forest along major transportation routes, such as Snoqualmie Pass and Stevens Pass, would have a striking effect upon the scenic qualities because of the sharply contrasting geometric forms that are created by timber harvest activities.”

“Alternative C. I do not think we should be stressing scenic management strategies in areas of mixed ownership. The Alpine Lakes plan area should be revised to de-emphasize scenic management in the checkerboard areas. Holding to the VQO’s that will not be met regardless of our own actions forces trade-offs in commodity goods that are not needed nor wise.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0744, 0900, 2138, 2201, 3871

FOREST SERVICE RESPONSE:

There are approximately 293,100 acres of intermingled ownership land within the Wenatchee National Forest. Intermingled ownership patterns create geometric patterns that are not compatible with the natural patterns of form, line, color and texture of the landscape. The goal of the Forest Service is to shape and blend management activities seeking the highest aesthetic design possible, while other land owners may have different objectives. It is believed that sensitive project design on National Forest land will help maintain scenic value in a corridor of mixed ownership even though it will not approach the natural scenic appearance of a key corridor located within solid National Forest ownership.

29 WILL SCENIC AREAS VIEWED FROM TRAILS BE MAINTAINED AND PROTECTED?

COMMENTS INCLUDED:

“Ironically, the greatest views on the forest are not always within the wilderness. Often, in fact, the views from the wilderness are toward a maze of logging roads while the greater views are those from vantage points such as old lookouts. In my experience, roads aren’t built simply to open it up for the recreating public, rather, it is simply the precursor to timber activity.”

“ST-2 - We applaud what appears to be the retention of the “natural landscape.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0552, 1947, 2720, 2800, 2817, 2879, 2963, 2968, 3029, 3085, 3246, 3544, 3615, 3936, 4275, 4491

FOREST SERVICE RESPONSE:

Along important scenic trails the foreground will be maintained for high visual quality. The majority of the trails, approximately 90%, will have scenic protection. Other trails of lower use will have lesser protection of visual quality.

The degree of visual quality depends on the type of trail and what land use allocation the trail traverses. High scenic quality will not be maintained along trails in general forest and some trails within the wildlife prescription allocation. High vista points and viewpoints along trails that have panoramic views may have the middleground and background views slightly altered to heavily altered due to the superior view angle, and the vastness of the lands visible. (Refer to the Management Prescriptions in Chapter IV of the Forest Plan.)

30 VISUAL RESOURCES SHOULD BE MONITORED BY THE LANDSCAPE ARCHITECT.

COMMENTS INCLUDED:

“Wouldn’t the visual resource monitoring be best done by the landscape architect in the recreation staff offices area, rather than the timber staff officer? The fox guarding the hen house?”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

2832

FOREST SERVICE RESPONSE:

The landscape architect is a team member who is involved with monitoring impacts on the visual resource. Administratively, on the Wenatchee National Forest, the visual resource program is located within the timber organization because the timber management program has the most potential for affecting scenic views. We feel that this strengthens coordination and cooperative relationship towards meeting visual resource objectives.

31 WHAT ARE THE LANDSCAPE ARCHITECTURAL PRINCIPLES THAT WILL BE APPLIED ON TRAIL LOCATION AND DESIGN?

COMMENTS INCLUDED:

“There is an inference to ‘landscape architectural principles.’ I would be interested in knowing what principles will be applied to trail design and location. Both Forest Service personnel and the trail using public should know these principles so they can ensure as well as monitor conformance.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

3440

FOREST SERVICE RESPONSE:

Six basic principles affect the visual dominance of form, line, color and texture in a landscape. These principles are: contrast, sequence, axis, convergence, codominance, and enframement. The main consideration for trails is providing a sequence of experience in viewing varied landscapes. Reference - Agr. Handbook Number 4343, USDA Forest Service, 1973.

32 ARE SCENIC QUALITIES IMPORTANT FOR TOURISM AND RECREATION JOBS?

COMMENTS INCLUDED:

“The preferred alternative continually discusses the importance of scenic qualities but fail to recognize and consider the importance of these tourism and recreation jobs. This manifests itself in the plans calling for the alteration of 14 out of 28 identified viewsheds.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0062, 0508, 0713, 2037, 2053, 2955, 2963, 3105, 3185, 3209, 3228, 3323, 3394, 3425, 3495, 3520, 3648, 3690, 3871, 3911, 4081, 4241, 4450, 4453, 4493, 4496, 4501

FOREST SERVICE RESPONSE:

We recognize the importance of scenery in attracting visitors to the Wenatchee Forest and adjacent tourism-based communities like Leavenworth. We believe the Forest Plan emphasis on protection of key scenic views and careful design of management activities will ensure that the Wenatchee Forest is a beautiful place to visit for generations to come.

33 WILL SCENIC AREAS VIEWED FROM LAKES BE MAINTAINED AND PROTECTED?

COMMENTS INCLUDED:

“Why is there no inventoried viewshed (P. IV-40) around Lake Wenatchee, one of the most scenic and most photographed locations on the forest?”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0609, 2720, 2894, 2923, 3143, 3293, 3294, 3295, 3296, 3449, 3529, 3641, 3661, 3863, 4107, 4477

FOREST SERVICE RESPONSE:

Most lakes and surrounding areas will be managed for high scenic qualities. The exceptions are where intermingled ownerships are adjacent to the lakes and where other resource values exist. In these instances, some lakes will not have the highest visual protection. The National Forest land around Lake Wenatchee will have high visual quality objectives. (Refer to the alternative maps and Chapter IV of the FEIS.)

34 HOW CAN TIMBER HARVESTING IMPROVE VISUAL QUALITY?

COMMENTS INCLUDED:

“The Forest is stuck to the idea that it can improve the scenery by managing the resource. We see this as simply a ploy to increase the ASQ. The I-90 corridor is a mess. Now Longview Fiber is in the process of trashing the Swauk Pass area.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

2054, 2835, 3621, 4467, 4479, 4490, 4496

FOREST SERVICE RESPONSE:

A natural appearing existing landscape is dynamic and constantly changing community of plants and animals. The manipulation of this dynamic situation to achieve a desired variety of conditions is the essence of a managed forest. Timber harvesting over time and space can provide a variety of vegetation age classes and openings for viewing distant landscapes. It can expose large contrasting tree boles, encourage plant community diversity, and fall colors. Vegetative variety and natural appearing edges create visual variety along travel routes.

There are many examples of timber harvest along travel routes on the Wenatchee National Forest where the long-term visual variety and diversity have been increased. Refer to Chapter IV of the FEIS for a graphic illustration of the retention and partial retention visual quality objectives.

WILD AND SCENIC RIVERS

35 RECOMMENDATIONS FOR THE DESIGNATION OF WILD AND SCENIC RIVERS.

COMMENTS INCLUDED:

“Wild and Scenic Rivers. I would go with the maximum.”

“The draft Wenatchee Forest Plan does not go far enough for river protection.”

“I believe wild, scenic, and recreational designation should be applied to the Forest after study.”

“Your Forest Plan should also evaluate segments of candidate Wild and Scenic Rivers which are within designated Wilderness.”

“We support your recommendation of the eight rivers for Wild and Scenic classification.”

“We oppose the designation of the eight rivers as Wild and Scenic.”

3193, 3199, 3202, 3203, 3205, 3206, 3208, 3211, 3217, 3225, 3228, 3231, 3235, 3238, 3239, 3242, 3245, 3256, 3261, 3270, 3271, 3273, 3277, 3288, 3293, 3298, 3304, 3307, 3308, 3314, 3315, 3317, 3319, 3320, 3321, 3323, 3328, 3335, 3341, 3343, 3352, 3360, 3362, 3365, 3369, 3379, 3381, 3384, 3393, 3399, 3402, 3406, 3408, 3409, 3429, 3449, 3464, 3468, 3472, 3473, 3475, 3479, 3483, 3491, 3493, 3509, 3510, 3515, 3518, 3519, 3520, 3521, 3557, 3558, 3567, 3579, 3583, 3593, 3600, 3601, 3606, 3621, 3623, 3630, 3632, 3634, 3638, 3640, 3641, 3648, 3651, 3667, 3669, 3673, 3683, 3692, 3694, 3705, 3723, 3728, 3735, 3744, 3749, 3752, 3753, 3769, 3770, 3791, 3792, 3795, 3797, 3805, 3811, 3816, 3821, 3832, 3837, 3858, 3868, 3878, 3899, 3926, 3928, 3930, 3940, 3947, 3955, 3989, 4004, 4005, 4013, 4015, 4019, 4021, 4022, 4034, 4035, 4037, 4046, 4061, 4067, 4094, 4107, 4109, 4110, 4112, 4127, 4128, 4139, 4141, 4142, 4146, 4150, 4157, 4158, 4161, 4166, 4169, 4179, 4194, 4195, 4204, 4207, 4222, 4232, 4234, 4243, 4257, 4261, 4269, 4270, 4277, 4279, 4282, 4298, 4306, 4406, 4408, 4415, 4427, 4434, 4437, 4442, 4444, 4446, 4449, 4452, 4454, 4460, 4469, 4470, 4477, 4491, 4493, 4494, 4498, 4502, 4507, 4507, 4511, 9007, 9017, 9034, 9040, 9041, 9042, 9045, 9046, 9062, 9066, 9074, 9077, 9079, 9094, 9097, 0002S, 0007S, 0017S, 0018S, 0019S, 0023S, 0024S, 0026S, 0030S, 0032S, 0033S, 0034S, 0036S, 0039S, 0040S, 0041S, 0047S, 0051S, 0052S, 0053S, 0054S, 0055S, 0055S, 0056S, 0058S, 0059S, 0060S, 0061S, 0062S, 0063S, 0064S, 0065S, 0066S, 0067S, 0068S, 0069S, 0070S, 0071S, 0075S, 0075S, 0076S, 0082S, 0084S, 0085S, 0086S, 0087S, 0088S, 0089S, 0090S, 0091S, 0094S, 0095S, 0097S, 0099S, 0102S, 0106S, 0110S, 0112S, 0115S, 0116S, 0118S, 0138S, 0143S, 0149S, 0151S, 0156S, 0157S, 0159S, 0160S, 0165S, 0173S, 0175S, 0176S, 0178S, 0180S, 0181S, 0183S, 0185S, 0187S, 0197S, 0209S, 0212S, 0215S, 0223S, 0224S, 0225S, 0227S, 0229S, 0303S, 0312S, 0313S, 0316S, 0333S, 0340S, 0359S, 0361S, 0363S, 0408S, 0410S, 0417S, 0419S, 0425S, 0426S, 0452S, 0460S, 0461S, 0463S, 0464S, 0467S, 0469S, 0498S, 0585S, 0587S, 0590S, 0591S, 0593S, 0594S, 0599S, 0600S, 0604S, 0607S, 0617S, 0618S, 0619S, 0648S, 0656S, 0658S, 0660S, 0661S, 0664S, 0666S, 0667S, 0668S, 0670S, 0675S, 0677S, 0680S, 0691S, 0693S, 0694S, 0706S, 0712S, 0720S, 0721S, 0723S, 1038S, 1038S, 1053S, 1056S, 1056S, 1057S, 1058S, 1059S, 1060S, 1062S, 1064S, 1067S, 1068S, 1070S, 1072S, 1077S, 1079S, 1080S, 1081S, 1082S, 1083S, 1084S, 1087S, 1089S, 1096S, 1098S, 1101S, 1102S, 1103S, 1107S, 1109S, 1117S, 1121S, 1123S, 1123S, 1138S, 1138S, 1139S, 1144S, 1145S, 1148S, 1152S, 1153S, 1155S, 1157S, 1157S, 1158S, 1159S, 1161S, 1163S, 1164S, 1167S, 1171S, 1177S, 1178S, 1179S, 1179S, 1180S, 1180S, 1181S, 1185S, 1188S, 1189S, 1190S, 1191S, 1192S, 1194S, 1196S, 1198S, 1199S, 1201S, 1202S, 1204S, 1206S, 1207S, 1208S, 1209S, 1210S, 1211S, 1212S, 1215S, 1216S, 1218S, 1219S, 1220S, 1222S, 1223S, 1224S, 1227S, 1227S, 1229S, 1230S, 1232S, 1234S, 1235S, 1236S, 1239S, 1240S, 1242S, 1243S, 1248S, 1249S, 1251S, 1256S, 1257S, 1258S, 1259S, 1264S, 1302S, 1306S, 1308S, 1313S, 1314S, 1315S, 1316S, 1318S, 1319S, 1322S, 1323S, 1324S, 1333S, 1335S, 1354S, 1369S, 1375S, 1376S, 1377S, 1381S, 1382S, 1401S, 1402S, 1403S, 1404S, 1407S, 1408S, 1411S, 1412S, 1413S, 1414S, 1415S, 1416S, 1417S, 1418S, 1419S, 1423S, 1425S, 1426S, 1427S, 1428S, 1429S, 1433S, 1434S, 1435S, 1436S, 1437S, 1571S, 1572S, 1580S, 1581S, 1582S, 1582S, 1584S, 2014S, 2015S, 2016S, 2017S, 2018S, 2019S, 2020S, 2040S, 2041S, 2042S, 2043S, 2045S, 2046S, 2047S, 2050S, 2058S, 2059S, 2060S, 2061S, 2062S, 2063S, 2064S, 2064S, 2065S, 2067S, 2068S, 2069S, 2071S, 2073S, 2074S, 2074S, 2075S, 2076S, 2077S, 2078S, 2079S, 2080S, 2081S, 2082S, 2083S, 2102S, 2155S, 2158S, 2159S, 2160S, 2165S, 2167S, 2168S, 2169S, 2170S, 2171S, 2172S, 2172S, 2173S, 2174S, 2175S, 2176S, 2177S, 2180S, 2181S, 2182S, 2183S, 2184S, 2185S, 2187S, 2187S, 2189S, 2190S, 2192S, 2193S, 2193S, 2194S, 2194S, 2196S, 2197S, 2200S, 2201S, 2240S, 2242S, 2243S, 2248S, 2249S, 2250S, 2251S, 2271S, 2273S, 2274S, 2276S, 2277S, 2303S, 2304S, 2305S, 2307S, 2308S, 2308S, 2309S, 2310S, 2311S, 2312S, 2313S, 2315S, 2316S, 2319S, 2319S, 2320S, 2364S, 2366S, 5042S, 5043S, 5067S, 5070S, 5072S, 5074S, 5075S, 5078S, 5080S, 5081S, 5082S, 5083S, 5085S, 5097S, 5098S, 5100S, 5102S, 5102S, 5118S

FOREST SERVICE RESPONSE:

We received considerable public response to the draft Forest Plan concerning Wild and Scenic Rivers. In fact, there was so much that we formed an interdisciplinary team (ID Team) to study the public comment and consider the rivers of interest to the public in greater detail. The majority of the comment supported adding additional rivers to those recommended for designation in the Draft.

The ID Team analyzed 20 rivers that were identified in the public comments as having significant resource values worthy of further review. During the review, the ID Team found that 9 of these 20 rivers possessed at least one outstandingly remarkable value and were eligible for designation. Of the nine rivers, eight were found to be suitable for designation. The change of recommendation to include eight rivers was such a departure from the Draft Forest Plan that a supplement was prepared and issued to provide the opportunity for public comment. A series of public meetings were held in conjunction with the public comment period to help inform people of the proposal and explain the implications of river designation under the Act. Following the public comment period, an additional 13 rivers were examined for eligibility, and some of the original 20 were reassessed. As a result of the renewed study, a ninth river was recommended for inclusion in the Wild and Scenic River System. A complete description of the eligibility and suitability analyses is provided in Appendix E of the FEIS.

36 MANAGEMENT AND FINANCING OF RIVERS DESIGNATED UNDER THE WILD AND SCENIC RIVERS ACT

COMMENTS INCLUDED:

“What specifically can the property owners expect if Congress decides to move ahead with Wild and Scenic River designations?”

“River management plans will be developed after designation, so how can you presume to discuss it?”

“The ORV use in river corridors is inconsistent with the objectives of the Wild and Scenic Rivers Act.”

“The public has good access to the waterways, lakes, forests and wilderness areas. We do not need more public access.”

“River rafting should be prohibited with the possible exception of individual inner-tube rafting and even that should be discouraged.”

FOREST SERVICE RESPONSE:

The objectives of designation of a river as Wild, Scenic or Recreational are provided in the Wild and Scenic Rivers Act. They are to:

- Preserve the river in free-flowing condition, without impoundments or diversions, and to protect water quality.
- Protect the river and its immediate environment for the benefit and enjoyment of the present and future generations.
- Protect or enhance the unique resource values which caused the river to be designated under the Act.

To ensure these objectives are carried out, the Wild and Scenic Rivers Act requires that a detailed management plan be prepared for each designated river. The plan will address the specific where's, how's and when's of development and uses within the river corridor, including questions relating to public access, the type of recreation activities and facilities appropriate to the river and corridor areas, the levels of motorized and other recreation use that are appropriate and desirable, measures for the protection of private property along the river, the relationship of Federal plans to State and County administration within the corridor, and protection of the significant river resource values.

While it is true that the specifics of these plans have not been developed, there are certain principles common to their preparation that we intend to follow. Each plan will rely heavily on public involvement throughout its development, including that of landowners, other involved government agencies, and groups interested in river management. In fact, we will be encouraging partnerships between the Federal government and local government and the private sector, in the management of these rivers. The issues and concerns identified during the Suitability Study (see Appendix E of the FEIS) will be addressed, as will any new issues that surface during the public involvement. The management plans will be the key documents in resolving potential conflicts, in identifying sensitive resource values, and in protecting private property within the river corridors.

With the exception of a 200 foot stretch of right-of-way near the Highway 209 bridge at Plain, there are no plans for acquisition of private lands in connection with river designation. Land uses and developments on private lands within the river area which were in existence when the river was designated will be permitted to continue, to the extent these are compatible with county zoning and state regulations. Finally, we have offered some "umbrella guidelines" in Appendix E of the FEIS. These outline the direction that we propose to follow in developing our management plans and in administering the designated rivers.

The level of funding provided for development and management of the Wild and Scenic River corridors will be determined by Congress. Regardless of the final allocation, we are committed, at the very minimum, to the protection of those values for which the individual rivers are recognized.

37 THE WILD AND SCENIC RIVERS ACT IS UNCLEAR IN MANY RESPECTS

COMMENTS INCLUDED:

"The Wild and Scenic Rivers Act is vague and not a vehicle to protect our rivers. The intent of the act is good and noble, but the Act itself is a mess open to many legal and ethical questions."

"Most of the opposition to Wild and Scenic Rivers is based on misunderstanding of the Wild and Scenic Rivers Act and uncertainty about future river management plans for designated rivers."

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

2044, 0102S, 0464S, 0498S, 1157S, 1238S, 1423S, 2050S

FOREST SERVICE RESPONSE:

Congress enacted the Wild and Scenic Rivers Act in 1968 in an attempt to keep selected rivers or river segments in a free-flowing condition, and to recognize their importance to our natural and cultural heritage. As is true of many of our Federal laws, the language is fairly broad, in order to encompass a

complex and variable situation. However, there are additional mechanisms by which the implementation of the law and its application in individual situations are more clearly defined. These include the joint Department of Interior/Department of Agriculture Revised Guidelines for Eligibility, Classification and Management of River Areas, as well as the Forest Service Land and Resource Management Planning Handbook, Chapter 8, which describes the process for identifying and evaluating potential river additions to the system, and the procedures for obtaining public review and comments.

Detailed management plans for designated river corridors will be prepared with the full involvement of the public, including any potentially affected landowners (See Item 12 of the Management Guidelines in Appendix E of the FEIS). These plans will try to resolve specific issues and questions that might exist, and will provide direction that incorporates public needs and concerns, while assuring the protection of the special values for which the rivers or river segments were designated.

38 DESIGNATING ADDITIONAL RIVERS INTO THE WILD AND SCENIC RIVER SYSTEM WILL COST TOO MUCH MONEY AND TAKE MORE LANDS OUT OF "MULTIPLE USE"

COMMENTS INCLUDED:

“There is already more Federal and State land designated for preservation and recreation than what is feasible to financially and efficiently manage.”

“Why should there even be a thought of adding more expensive responsibilities of policing private property?”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0011S, 0034S, 0072S, 0096S, 0214S, 0215S, 0316S, 0342S, 0654S, 0655S, 0697S, 0719S, 1119S, 1152S, 1168S, 1215S, 1217S, 1234S, 1242S, 1244S, 1253S, 1372S, 1373S, 1376S, 1378S, 1380S, 1422S, 1577S, 1587S, 2014S, 2017S, 2042S, 2045S, 2054S, 2055S, 2057S, 2142S, 2156S, 2191S, 2245S, 2246S, 2247S

FOREST SERVICE RESPONSE:

Congress enacted the Wild and Scenic Rivers Act in an attempt to balance the need to develop some of the nation's rivers for hydropower purposes with that of retaining some of the rivers in their free-flowing, natural state. These latter rivers were to be recognized for their special physical, recreational and cultural values, regardless of ownership (see Chapter III of the FEIS). It is true that management of these rivers will cost additional money, but Congress clearly indicated that the outstandingly remarkable values of the designated rivers are worth protecting. At the same time, we will use prudent measures in the management of the river corridors. River designation does not require that lands be removed from multiple use. As is described in the suitability analysis in Appendix E of the FEIS, timber harvest, recreation development, construction of needed facilities, and other uses are permitted within a Scenic or Recreational river corridor, as long as these are sensitive to the values to be protected.

Appendix E also notes that where privately-owned property is included within the proposed boundaries, it is our intent to rely on State and County control for their administration.

39 THE PROCESS FOR ANALYZING ELIGIBILITY IS FLAWED

COMMENTS INCLUDED:

“The final lists of ineligible and eligible rivers suggest that a review of the eligibility determination process is necessary.”

“No landowners of private lands which could be affected by the Wild and Scenic Rivers designation were included in selection of rivers to be studied.”

“The criteria for eligibility were entirely subjective. More objective standards must be developed and utilized.”

FOREST SERVICE RESPONSE:

Rivers were identified for potential eligibility through the Nationwide Rivers Inventory published by the National Park Service in 1982, through in-Service study, and through the public response to the DEIS and the 1988 Supplement. The comments of those private landowners who responded to the latter documents were included in the selection of rivers and in the eligibility and suitability studies which are presented in Appendix E of the FEIS.

We agree that our distinction between outstandingly remarkable and above average values was frequently unclear in the Supplement, and we have amended the descriptions accordingly in the Appendix. To the extent possible, objective standards were applied in determining eligibility. Scenic values, for instance, were rated on the character type of the area (either Northeastern or Recent Cascades character types), with landform, waterform, rockform, and vegetative type providing the defining characteristics. However, as the joint Department of Interior/Department of Agriculture Guidelines for Eligibility, Classification and Management of River Areas state, the determination that a river area contains outstandingly remarkable values is a professional judgement on the part of the study team. There is no known way to write criteria so as to automatically or mechanically determine that certain values are outstandingly remarkable. In making these assessments, we used our most knowledgeable specialists and river experts. Other agencies, such as the U.S. Fish and Wildlife Service, the Washington State Department of Game, Washington State Natural Heritage within the Department of Natural Resources, and the Washington State Scenic Rivers Program were also consulted. The eligibility determination took into consideration each river's values as viewed within the state or national context, as well as within the particular physiographic area.

We did examine some of the larger tributaries of those rivers proposed for designation during the evaluation study. A few of these merited recommendation for inclusion in the Wild and Scenic Rivers System (such as the Waptus River, and of course the various tributaries of the Wenatchee River), but most lacked the outstandingly remarkable values to qualify them for eligibility. However, riparian manage-

ment prescriptions exist that can be used to protect specific values within these other river/creek corridors. See Chapter IV of the Forest Plan.

40 THE SUITABILITY ANALYSIS WAS DONE IMPROPERLY

COMMENTS INCLUDED:

“You have purposely combined two important, independent issues into one. They are the reasonably foreseeable potential uses of the land and water which would be enhanced, foreclosed or curtailed if the area were included in the Wild and Scenic River System, and the values which could be foreclosed or diminished if the area is not protected as part of the system.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

2021S

FOREST SERVICE RESPONSE:

Current national direction combines these issues as a single factor in determining suitability of a river for designation. However, in our amended Suitability Analysis (see Appendix E of the FEIS), we have tried to more clearly distinguish these two points. It is also interesting to note that Section 4(a) of the Wild and Scenic Rivers Act requires an analysis of only the first of these issues, as listed in the comments above.

41 HOW WERE RIVERS SEGMENTED FOR PURPOSES OF CLASSIFICATION?

COMMENTS INCLUDED:

“The Supplement to the DEIS segmented the White River into two “Scenic” segments. The upper segment is totally Federal and the lower mostly private. Why?”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0002S, 1156S, 1577S

FOREST SERVICE RESPONSE:

In defining river segments, we considered such factors as physical changes in the river character, significant differences in the level of development along the river corridor, and changes in land ownership patterns. We segmented the Scenic stretch of the White River on the basis of land ownership, so as to facilitate management within this part of the corridor. The lowest segment is approximately 64% private, and it is our intention to rely on State and County administration of the private holdings here. A full description of the segments can be found in the suitability analysis of the White River in Appendix E of the FEIS.

42 RECOMMENDING ELIGIBLE RIVER SEGMENTS AT LESS THAN THEIR HIGHEST POTENTIAL CLASSIFICATION IS QUESTIONED.

COMMENTS INCLUDED:

“We strongly object to the Forest’s practice of downgrading river segments found eligible for inclusion in the National Wild and Scenic Rivers System.”

“The Forest has generally done a good job of classifying the river segments, but should not recommend river segments for designation at a classification less than they qualify for.”

“...opposed to scenic designation for the Entiat in that portion that meets ‘wild’ criteria.”

“Upgrade the Recreation classification on the Cle Elum River.”

“The Icicle, Chiwawa and Entiat Rivers contain segments that Alternative ‘C’ proposes for designation at less than their highest potential classifications. However, an adequate discussion of the reasons those particular segments should be designated at lower levels of classification has not been provided.”

FOREST SERVICE RESPONSE:

As described in Chapter III and Appendix E of the FEIS, there are three steps involved in considering a river for inclusion in the Wild and Scenic Rivers System. The first step is to determine the eligibility of the river, or river segments, based on the free-flowing characteristics and any “outstandingly remarkable” values that the river might possess. If a river or segment thereof is determined eligible, the next step in the process is to classify it as Wild, Scenic or Recreational, based on the present attributes of the corridor, as observed from the river itself. This is an objective assessment, directed to the highest potential classification of the river (Chapter III of the FEIS lists all eligible rivers at their highest potential classification). As required by the Wild and Scenic Rivers Act, the final step is to determine the suitability of the eligible river or river segments for designation based on such factors as the values of the river that are to be protected, existing landownership patterns, and the nature of current and projected uses in the corridor.

Appendix E provides the details of this analysis for all eligible rivers on the Wenatchee National Forest. The recognition of all of these needs may result in a recommendation for designation at less than the highest potential classification. This was the case for the following eligible rivers or river segments:

Chiwawa River, Segment 2 (between the Wilderness boundary and Goose Creek) - Although this segment meets the standards for classification as a Scenic River, we are recommending a Recreational classification because of anticipated plans for recreational development and use of National Forest lands within the corridor, as well as plans for proposed in-stream fisheries enhancement structures and improvements.

Cle Elum River, Segment 3 (between Tucquala Lake and the Salmon La Sac bridge) - Seventy-one percent of the acreage in this segment is private. A Recreational classification better incorporates the objectives of local government, and the potential developments on private land.

Entiat River, Segment 2 (between Cottonwood and the Wilderness boundary) - We are recommending a Scenic rather than Wild classification of this segment primarily because of continued motorized use along Trail #1400 as far as the Myrtle Lake Trailhead. Although trail bike use is allowed under both Wild and Scenic classifications, it is more compatible with the latter. Furthermore, this area is allocated in the Forest Plan to unroaded, non-motorized use southwest of the river, and unroaded, motorized use northeast of the river. There would be no scheduled timber harvest or road construction within this portion of the corridor, thus maintaining its basically "wild" characteristics.

Icicle River, Segment 2 (between the Wilderness boundary and the City of Leavenworth water intake) - We are recommending a Recreational rather than Scenic classification of this segment because of the anticipated need for future recreational developments within the corridor. The Icicle is one of the most heavily used watersheds on the Forest, and the expansion of existing recreational facilities as well as additional improvements will be necessary to meet this demand. Furthermore, approximately 46% of Segment 2 is private. A Recreational classification would better accommodate the private ownership here.

White River, Segment 3 (from the private land boundary above Tall Timber Ranch to Lake Wenatchee) - Although the highest potential classification of this segment is Scenic, we are recommending Recreational classification because of the management needs that exist here. One of the primary concerns is for the sockeye salmon fishery. A Scenic designation may preclude certain necessary enhancement structures or facilities, and therefore unnecessarily restrict our ability to manage one of the resource values which makes this river outstandingly remarkable.

It is important to recognize that significant river values will be protected at whatever level of classification a river is designated. There are also additional laws and regulations as well as the Forest Standards and Guidelines, special riparian prescriptions, and land allocations sensitive to the attributes of the river corridors (see Chapter IV of the Forest Plan) that would provide additional protection of these resources.

43 RECOMMEND ADDITIONAL RIVERS AND RIVER SEGMENTS FOR INCLUSION IN THE WILD AND SCENIC RIVER SYSTEM.

COMMENTS INCLUDED:

"The public has a right to have some rivers protected...to have access to rivers that reflect the wild and natural side of the way our country once was."

“Many more rivers or portions of rivers should receive Wild and Scenic River protection.”

“Their long range importance and the watersheds they represent make it difficult to accept only 8 out of 21!”

FOREST SERVICE RESPONSE:

An analysis was conducted on 13 additional rivers, river segments and creeks, in response to public comments after publication of the Supplement. These water courses included Chiwaukum Creek, Ingalls Creek, Lake Creek (in the Little Wenatchee drainage), Deep Creek, Nason Creek, Big Creek, Gale Creek, Gold Creek, Silver Creek, Mineral Creek, Taneum Creek, the lower stretch of the Cle Elum River, and the Rainier Fork of the American River.

The lower Cle Elum was eliminated from further consideration due to the fact that it does not meet the free-flowing criteria. The river channel here was modified by the construction of the Lake Cle Elum Dam in 1934, and it currently experiences controlled stream flow fluctuations as a result of this impoundment.

The remaining rivers/creeks were evaluated on the basis of the scenic, recreational, geological, fish, wildlife, cultural, historical and ecological values that are directly associated with the river corridors (the results of this study are documented in the Analysis File for the Forest Plan). Although these rated above average in several cases, none were determined to be outstandingly remarkable in the professional judgement of the evaluators. As a consequence, these additional rivers and creeks are not eligible for inclusion in the Wild and Scenic River System.

44 THE LOWER WENATCHEE RIVER SHOULD BE INCLUDED IN THE WILD AND SCENIC RIVER SYSTEM.

COMMENTS INCLUDED:

“Is the section between Cashmere and Wenatchee being considered? If not, it should at least have ‘recreational’ designation.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0075S, 0419S, 0679S, 0693S, 1153S, 1308S, 2169S, 2271S

FOREST SERVICE RESPONSE:

Our analysis was confined to that portion of the Wenatchee River that is within the National Forest boundary. This would exclude the segments of the river below Tumwater Canyon. However, the State of Washington is presently conducting an assessment of 18 rivers in the State which possess the natural, cultural and recreational values that would make them suitable additions to the Washington State Scenic Rivers System. Among these 18 is the Wenatchee River, from its outlet at Lake Wenatchee to its confluence with the Columbia River. We would suggest contacting the State for those stretches of the Wenatchee River between Leavenworth and Wenatchee.

45 RECONSIDER CERTAIN RIVERS FOR WILD AND SCENIC DESIGNATION

COMMENTS INCLUDED:

“The Mad River offers some of the finest stands of old growth on the East Side.”

“North Fork Entiat has outstanding scenery and geology...”

“The Yakima River needs to be protected.”

“Reconsider evaluation of the Kachess River.”

“The Teanaway has unique sandstone ledges with remarkable scenery.”

“The Middle Fork and West Fork Teanaway may not have the classical scenery that other rivers have, but their remoteness and recreation opportunities they provide are what I would call ‘outstandingly remarkable values.’”

“...glaciers can be viewed from the picnic areas at Cooper Lake. Portions above the lake go through large wet meadows, old ox-bow lakes and numerous beaver ponds.”

“The Waptus is certainly a “wild river” with much scenic appeal and recreational use. The confluence of the Waptus River with Cle Elum is a special place...the length between the wilderness boundary and the Cle Elum deserves special management.”

“This river is especially interesting, due to the diversity of habitats through which it flows and the extent and complexity to the braided riparian communities just above its confluence with Lake Wenatchee. We urge you to recommend the Little Wenatchee in your final LRMP. The specific recommendation should be for Wild designation in the Wilderness stretch and Scenic status outside the Wilderness.”

“I was disappointed that the Tieton with its outstanding recreational values was not included in your recommendation. The Tieton provides excellent whitewater boating during a time of the year when no rivers are capable of being floated.”

“I am appalled that no part of the Naches River is considered for ‘recreational’ or better classification.”

“Consideration should be given to classifying the Little Naches River as scenic.”

“The upper portion of the Bumping is certainly ‘outstandingly remarkable’ in every way. We are well acquainted with it historic, geologic, scenic, recreational, wild, the whole thing...; the lower portion is simply a beautiful mountain stream, historic and runs also through some unusual, geologically speaking, country.”

“Rattlesnake Creek, which is free-flowing its entire length, has a number of outstandingly remarkable values.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

3190, 3256, 3270, 0001S, 0036S, 0039S, 0055S, 0056S, 0075S, 0083S, 0089S, 0091S, 0092S, 0095S, 0097S, 0101S, 0102S, 0110S, 0114S, 0115S, 0116S, 0117S, 0148S, 0149S, 0152S, 0156S, 0160S, 0165S, 0173S, 0183S, 0185S, 0187S, 0197S, 0212S, 0217S, 0223S, 0227S, 0312S, 0313S, 0314S, 0319S, 0333S, 0334S, 0340S, 0341S, 0358S, 0359S, 0425S, 0452S, 0464S, 0469S, 0587S, 0591S, 0594S, 0598S, 0599S, 0604S, 0606S, 0607S, 0618S, 0619S, 0658S, 0660S, 0661S, 0666S, 0667S, 0668S, 0670S, 0676S, 0677S, 0679S, 0680S, 0691S, 0693S, 0694S, 0706S, 0721S, 1056S, 1058S, 1062S, 1064S, 1067S, 1068S, 1069S, 1070S, 1072S, 1077S, 1079S, 1081S, 1082S, 1083S, 1084S, 1087S, 1089S, 1092S, 1093S, 1095S, 1096S, 1103S, 1107S, 1109S, 1117S, 1121S, 1123S, 1124S, 1138S, 1139S, 1142S, 1143S, 1144S, 1145S, 1148S, 1155S, 1157S, 1158S, 1161S, 1164S, 1167S, 1171S, 1178S, 1179S, 1180S, 1181S, 1185S, 1188S, 1189S, 1190S, 1191S, 1192S, 1194S, 1197S, 1198S, 1199S, 1202S, 1204S, 1207S, 1209S, 1210S, 1211S, 1212S, 1218S, 1219S, 1222S, 1223S, 1224S, 1227S, 1229S, 1230S, 1231S, 1232S, 1233S, 1235S, 1243S, 1247S, 1248S, 1249S, 1251S, 1254S, 1255S, 1256S, 1259S, 1264S, 1301S, 1302S, 1308S, 1312S, 1313S, 1314S, 1315S, 1318S, 1319S, 1323S, 1324S, 1326S, 1329S, 1335S, 1354S, 1369S, 1381S, 1382S, 1401S, 1407S, 1408S, 1410S, 1411S, 1412S, 1413S, 1414S, 1415S, 1416S, 1417S, 1418S, 1419S, 1423S, 1425S, 1426S, 1427S, 1428S, 1429S, 1435S, 1436S, 1575S, 2040S, 2041S, 2048S, 2058S, 2063S, 2064S, 2065S, 2067S, 2073S, 2074S, 2076S, 2077S, 2078S, 2080S, 2081S, 2083S, 2102S, 2139S, 2155S, 2157S, 2158S, 2159S, 2160S, 2165S, 2166S, 2168S, 2169S, 2170S, 2171S, 2173S, 2174S, 2175S, 2176S, 2180S, 2181S, 2182S, 2183S, 2184S, 2185S, 2187S, 2189S, 2190S, 2193S, 2194S, 2197S, 2200S, 2201S, 2240S, 2251S, 2271S, 2273S, 2274S, 2276S, 2277S, 2303S, 2304S, 2305S, 2307S, 2308S, 2309S, 2309S, 2310S, 2311S, 2312S, 2313S, 2316S, 2319S, 2320S, 2364S, 5070S, 5072S, 5073S, 5074S, 5075S, 5076S, 5078S, 5079S, 5081S, 5082S, 5083S, 5084S, 5085S, 5094S, 5097S, 5100S, 5101S

FOREST SERVICE RESPONSE:

An ID Team reevaluated all of the rivers and river segments that were originally determined to be ineligible for inclusion in the Wild and Scenic River System, in response to new information presented by the public after publication of the Supplement. The process for this determination is described in the introductory comments to Appendix E of the FEIS.

With respect to the Yakima River, a formal evaluation of eligibility was not made due to the fact that National Forest lands make up less than 1% of the ownership in the drainage. However, the Yakima is listed as one of 26 rivers presently under consideration as part of the Washington State Scenic River Assessment program.

The Teanaway, which was originally considered as a single river system, was reevaluated as three separate corridors: the North Fork, the Middle Fork and the West Fork.

As a result of this reevaluation, the Waptus River has been recommended for designation as a Wild River, based on the outstandingly remarkable scenic values and pristine condition of the corridor. The full description of the eligibility and suitability analysis is provided in Appendix E of the FEIS. There was

no change made in the eligibility ratings of the remaining rivers. We do agree that there are a number of features within these drainages that could certainly be considered above average and thereby contribute to the distinctive character of the corridors. However, these values were either not directly associated with the riverine environment or, in the judgement of the ID Team, did not meet “outstandingly remarkable” standards. Other laws, land allocations, Forest Standards and Guidelines and management prescriptions are available that would more appropriately protect these attributes.

46 THE QUESTION OF HOW MUCH ANALYSIS THE FOREST SERVICE SHOULD DO BEFORE RECOMMENDING RIVERS FOR DESIGNATION WAS RAISED.

COMMENTS INCLUDED:

“The Forest Service should thoroughly analyze the impact of Wild and Scenic designation on any other resources prior to recommending any rivers suitable for designation.”

“The Forest Service should proceed with their course of recommending rivers without further analysis.”

“I do not support Wild and Scenic river designations arbitrarily, without studying the impact on all aspects affected.”

“Your recommendations were made by studying outdated maps. No recommendations should be made until each river has been physically surveyed.”

“I believe that the Forest Service should dove-tail their proposal with the Northwest Power Planning Council and others who are seeking protection of Northwest rivers.”

FOREST SERVICE RESPONSE:

An ID Team of professional specialists and the most knowledgeable river experts on the Forest reassessed the eligibility of all the rivers on the Wenatchee National Forest, after publication of the DEIS. Twenty of these rivers were considered possible candidates for more detailed evaluation, and an analysis of eligibility was completed. An ID Team was also assigned the task of completing a Suitability Analysis for the resulting eligible rivers. The suitability study included an evaluation of the impact of designation on other resources and uses within the eligible river corridor. In each case, the study teams included individuals familiar with the physical characteristics of the respective rivers. The results of this study were published in the 1988 Supplement.

The analysis was continued, based on new information and public response to the Supplement, on the original 20 rivers as well as on an additional 13 rivers, river segments and creeks. Comments from agencies such as the Northwest Power Planning Council, were considered in this further analysis. As a result of the additional study, some adjustments were made in the data, including changes in certain river segment classifications (see Appendix E of the FEIS). The recommendation of the Waptus River as being eligible and suitable for inclusion in the Wild and Scenic River System was also made.

47 THE ESTABLISHMENT OF THE WIDTH OF THE RIVER STUDY BOUNDARIES IS QUESTIONED.

COMMENTS INCLUDED:

“These zones seem narrower than necessary (1/2 mile) since they represent water conservation and protection of river habitat. Bare slopes above allow flood waters to bring down great gravel washes.”

“I have extensive knowledge of the White River Valley, having owned property there since 1975...I would argue for an increase (to 1/2 mile or more) of the width of the ‘pristine corridor’, and that logging be controlled not only with respect to scenic values but with respect to siltation and other water quality considerations.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0060S, 0075S, 0112S, 0181S, 0209S, 1188S, 1308S

FOREST SERVICE RESPONSE:

For the purposes of the analysis, the corridor boundaries for the eligible rivers or river segments have been set at the minimum required by law - 1/4 mile in width from each bank of the river. As rivers are designated, these boundaries will be formally determined, taking into consideration specific landmarks, resources, river values, or factors that might facilitate management of the river area. However, under provisions of the Wild and Scenic Rivers Act, no more than an average of 320 acres per river mile can be included within the boundary. This would preclude expanding the width of the corridor, on a general basis, to 1/2 mile from each bank.

We would encourage you to examine the preferred alternative map for the management prescriptions assigned to National Forest lands adjacent to the corridor, and the Standards and Guidelines in Chapter IV of the Forest Plan, with which we will manage those lands. We believe that this direction will help to protect the special resource values that exist in the White River and other eligible river drainages.

48 THE EFFECT OF WILD AND SCENIC RIVER DESIGNATION ON PROPERTY RIGHTS AND WATER RIGHTS IS QUESTIONED.

COMMENTS INCLUDED:

“Quit trying to take the rights of local landowners away by the idea that you will protect us all.”

“We should not let this Act provide for the free use of our rivers at the expense of landowners.”

“Private property values and rights, including water rights will deteriorate.”

“The Entiat Valley is so narrow that if private property were taken over by the government, there would not be enough private land left to support the local school district.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0048S, 0062S, 0077S, 0151S, 0214S, 0316S, 0409S, 0417S, 0418S, 0423S, 0424S, 0498S, 0697S, 0699S, 1049S, 1052S, 1071S, 1088S, 1140S, 1153S, 1156S, 1165S, 1168S, 1186S, 1215S, 1225S, 1237S, 1242S, 1245S, 1253S, 1260S, 1261S, 1262S, 1263S, 1309S, 1373S, 1374S, 1378S, 1379S, 1422S, 1431S, 1432S, 1433S, 1571S, 1580S, 1584S, 2014S, 2015S, 2016S, 2020S, 2059S, 2060S, 2070S, 2191S, 2192S, 2241S, 2245S, 2247S

FOREST SERVICE RESPONSE:

Designation of a river or river segment will have no effect on existing water and property rights. As mentioned elsewhere, there are no plans for acquisition of private lands, other than a short right-of-way to access National Forest land near the highway bridge at Plain. We plan to rely heavily on State and County controls for administration of private lands within the corridors. As noted in Appendix E of the FEIS, existing water rights and diversion facilities were recognized in the proposed classification of the study rivers.

In the case of the Entiat River, the channel below the proposed corridor boundary was determined to be ineligible for designation as a Wild and Scenic River due to previous modification and straightening of the channel. For this reason, the river below the private land boundary above Burns Creek could not be included, even at a later date, within the Wild and Scenic River System.

49 WILL CONGRESS INVITE PUBLIC COMMENT BEFORE THEY ACT ON DESIGNATING RIVERS TO BE INCLUDED INTO THE WILD AND SCENIC RIVER SYSTEM?

COMMENTS INCLUDED:

“Will Congress invite public comments or will they defer to your FEIS as adequate public input?”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0004S, 0316S, 0655S, 0719S, 1576S, 1577S, 1587S, 2021S, 2056S, 2191S

FOREST SERVICE RESPONSE:

It is our understanding that the Washington State Congressional delegation plans to conduct field hearings prior to recommending any legislation for Wild and Scenic River designation.

50 CONCERNS ABOUT "TAKINGS" AS A RESULT OF THE DESIGNATION OF RIVERS, PARTICULARLY THROUGH THE USE OF CONDEMNATION, AND THE ISSUE OF RECEIVING JUST COMPENSATION.

COMMENTS INCLUDED:

"We do not wish to allow any access or scenic easements across our land on the river nor do we want to be coerced into selling such easements through condemnation proceedings "

"I do hope we don't lose our property to the government."

"It is doubtful the present property owners would be paid fair market value for their riparian properties if the entire river was designated Wild and Scenic and the Federal Government condemned the properties."

"Any designation . . . which would effectively restrict all development would constitute a condemnation and taking without compensation in violation of the U.S. Constitution."

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0003S, 0008S, 0009S, 0012S, 0013S, 0014S, 0015S, 0016S, 0027S, 0038S, 0048S, 0068S, 0094S, 0095S, 0100S, 0165S, 0171S, 0214S, 0217S, 0224S, 0226S, 0427S, 0474S, 0603S, 0655S, 0682S, 0716S, 0723S, 1061S, 1071S, 1136S, 1182S, 1186S, 1234S, 1242S, 1253S, 1376S, 1580S, 1584S, 1587S, 2015S, 2016S, 2017S, 2019S, 2021S, 2049S, 2055S, 2066S, 2084S, 2085S, 2156S, 2191S, 2241S, 2247S, 2363S,

FOREST SERVICE RESPONSE:

As noted in Appendix E of the FEIS, the need for "takings" of any kind is expected to be very limited. The reasons for this are: (1) the Wild river segments where the need would normally be greatest are already federally owned; (2) the segments recommended for Scenic designation are in largely federally owned areas; (3) the segments recommended for Recreational river designation have numerous existing public access points; and (4) it is in the Forest's interest to rely heavily on State, County and local controls to maintain the quality along the rivers rather than on large scale acquisition of scenic or recreation easements.

In situations where acquisitions of any kind are needed federal law (the Act of Jan. 2, 1971, P.L. 91-646, 84 Stat. 1894; 42 U.S.C. 4601(6), 4601(8), 4621, 4622, 4651, 4653) requires early involvement of the owner and payment of just compensation. Any acquisition of real property rights in connection with Wild, Scenic or Recreational river designation will be subject to P.L. 91-646 and other applicable federal laws. At this time, the only projected need for land acquisition in any of the proposed river corridors is for a short, 200 foot stretch of right-of-way to access National Forest land at the Highway 209 bridge at Plain.

It is also important to note that the designation of a river or a segment of a river, under the Wild and Scenic Rivers Act, does not in itself constitute a taking. The federal government has no obligation to make compensation based solely on the act of designating a river or segment thereof.

51 CONCERN ABOUT THE NEED TO MAINTAIN EXISTING STREAMBANK PROTECTION STRUCTURES AND TO PLACE NEW STRUCTURES AS NEEDED TO PROTECT IMPROVEMENTS SUCH AS HOMES, OUTBUILDINGS, ROADS, CAMPGROUNDS, ETC.

COMMENTS INCLUDED:

“Oppose restrictions that do not allow for preventative maintenance along streams to prevent erosion of road rights-of-way.”

“Wild and Scenic Rivers designation precludes rip rap, erosion control...”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0046S, 1422S, 2270S

FOREST SERVICE RESPONSE:

Wild and Scenic Rivers designation does not necessarily preclude riprap or other erosion control measures along the river corridor. A Recreational classification specifically makes allowance for existing diversion works, riprap and other minor structures, provided the waterway remains generally natural in appearance. Although water supply dams and major diversion works are prohibited under a Scenic classification, minor maintenance structures existing at the time of designation would also be permitted. In addition, in the Management Guidelines in Appendix E of the FEIS the Forest is recommending that a provision to allow new riprapping where necessary to protect improvements existing prior to designation of the rivers, be included in legislation for designation of “Recreational” river segments. This would apply to most of the private land within the study corridors.

52 CONCERN THAT STATE, COUNTY AND LOCAL CONTROLS ARE ALREADY ADEQUATE TO PROTECT THE RIVERS BEING PROPOSED. DESIGNATION WOULD RESULT IN UNNECESSARY AND REDUNDANT RESTRICTIONS AT THE TAXPAYERS EXPENSE AND WORK A HARDSHIP ON THE PRIVATE LANDOWNERS IN THE DESIGNATED AREAS.

COMMENTS INCLUDED:

“The river corridors are already protected by County zoning, State Shorelines Act, Department of Ecology, and Washington State Department of Fisheries. The U.S. Forest Service is doing a good job protecting the rivers within their boundaries by controlling timber harvest, by restricting road development, and controlled development of trails and campgrounds. Why should we need more government involvement in this situation?”

“Existing ordinances (in Kittitas County) protect the future generations and their right to enjoy the many beautiful rivers in Washington State.”

“Chelan County opposes designation of the eight rivers because there are sufficient laws at the county and state level to protect our rivers, lakes, waterways, and other environmental areas. The needs of our county are best left at the local level.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0028S, 0068S, 0077S, 0087S, 0096S, 0214S, 0215S, 0316S, 0344S, 0409S, 0415S, 0416S, 0418S, 0423S, 0424S, 0496S, 0497S, 0518S, 0542S, 0545S, 0546S, 0547S, 0549S, 0550S, 0551S, 0552S, 0557S, 0590S, 0592S, 0655S, 0696S, 0697S, 0711S, 0713S, 0717S, 0719S, 1066S, 1071S, 1088S, 1119S, 1152S, 1153S, 1156S, 1176S, 1183S, 1186S, 1187S, 1217S, 1234S, 1236S, 1237S, 1238S, 1242S, 1244S, 1245S, 1253S, 1261S, 1309S, 1317S, 1325S, 1373S, 1376S, 1378S, 1379S, 1424S, 1432S, 1522S, 1571S, 1572S, 1576S, 1577S, 1580S, 1582S, 1584S, 1585S, 1586S, 1587S, 1736S, 2014S, 2015S, 2016S, 2018S, 2019S, 2020S, 2021S, 2042S, 2054S, 2056S, 2057S, 2060S, 2062S, 2066S, 2070S, 2085S, 2178S, 2181S, 2191S, 2192S, 2241S, 2245S, 2247S, 2270S, 2363S, 5077S

FOREST SERVICE RESPONSE:

The effects of County zoning, Shoreline Master Programs, the State Shorelines Act, special controls such as the Icicle Design Overlay and the State Forest Practices Act have been reviewed in relation to the nine rivers identified in the Supplement and are described in Appendix E of the FEIS. With the exception of those areas in Chelan County's Shoreline Master Program which are in the "Natural" category, none of the State or local controls protect the free-flowing nature of the streams being considered for designation. A review of the Master Program indicates that only the White River is extensively classified as Natural. The Wenatchee has a significant length so classified, but only on one side of the river. Even the controls in the Icicle Creek area allows hydroelectric development. This could result in the construction of diversion structures and dams. Thus without designation under the Wild and Scenic Rivers Act, there is no way to assure the continued free-flowing nature of these streams.

Numerous additional restrictions are not anticipated as a consequence of inclusion of a river in the Wild and Scenic Rivers System. It is our intent to rely on State and County controls for administration of the private land within designated river corridors as stated in the suitability study in Appendix E. Only if local governmental action cannot be implemented or cannot provide the necessary protection of river values on non-Federal land, would the imposition of additional controls or restrictions be likely.

53 DESIRE FOR PUBLIC ACCESS, PARTICULARLY TO GET TO THE STREAMS AND TO USE THE BED OF THE STREAM; CONCERN ABOUT THE IMPACT ON PRIVATE PROPERTY IF PUBLIC ACCESS IS PROVIDED.

COMMENTS INCLUDED:

“The Ephrata Sportsmen’s Association recommends that the Forest Service obtain easements or dedication deeds on privately owned stream beds to permit the public to make full use of them without having to obtain permission each time from the stream bed owners.”

“We do not wish to allow any access or scenic easements across our land on the river nor do we want to be coerced into selling such easements through condemnation proceedings.”

As a property owner on Icicle Creek, I am quite concerned about being able to build a cabin and use my property without having to open it to public access.

“I have lived here for a total of 35 years. In the past ten years I see what it is like when it is already open ‘for public (recreational) use’ and how it is being damaged as this ‘public’ descends by ever-increasing numbers. How can you ‘preserve...’ and ‘protect...’ all the ‘outstandingly remarkable’ features by openly inviting even more of the public in? Our valley, and most likely the others, also already have about all the traffic they can stand. And then to threaten that you might need to condemn private land to acquire easements ‘to protect river values’ almost in the same breath as you say ‘recreational use of public lands within the corridor would be emphasized’ and some easements might be ‘critically needed for public use.’ How unfair, particularly to landowners and wildlife.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0224S, 0417S, 1186S, 1379S, 1574S

FOREST SERVICE RESPONSE:

Since publication of the Supplement, we have reevaluated the need for acquisition of private land. With the exception of a short right-of-way near the Highway 209 bridge at Plain, we do not anticipate a need to acquire any additional lands within the recommended river corridors. Furthermore, we will rely on State and County controls, as mentioned in Appendix E of the FEIS, for administration of the private lands. With respect to the impacts created by public use, designation can provide the responsible agency with the management tools to control and direct this use, so as to preserve the values for which the river was designated. The development of a detailed management plan for the river corridor will be the first step in accomplishing this goal.

54 CONCERN ABOUT DESIGNATIONS PRECLUDING ROADS NEEDED TO ACCESS PRIVATE LANDS.

COMMENTS INCLUDED:

“We see a conflict between preservation within the Scenic or Recreational Corridor and the possible obligation of the Government to provide road access for inholders where other access is not available.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0603S

FOREST SERVICE RESPONSE:

Both Scenic and Recreational classifications allow for construction of new roads, particularly where these are required for access to private inholdings. In the case of a Scenic classification, the only restrictions posed by designation would apply to utilization of construction techniques that minimize adverse effects on river values, and to keeping the road segment well screened and inconspicuous from the river.

55 A COMMENTOR FELT THAT STATEMENTS IN THE FACT SHEET RELEASED AT THE TIME OF THE SUPPLEMENTAL DEIS CONTAINED CONTRADICTORY STATEMENTS REGARDING THE USE OF CONDEMNATION. THE STATEMENTS REFERRED TO ARE CONTAINED IN THE LAST PARAGRAPH OF PAGE 1 OF THE FACT SHEET.

COMMENTS INCLUDED:

“We are concerned about private land owners on the so called ‘scenic rivers’. Your ‘Fact Sheet’ accompanying this states in one sentence that acquisition would have to be from ‘willing sellers.’ Then the next sentence says ‘condemnation’ can be used. Which is it???”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0038S

FOREST SERVICE RESPONSE:

This appears to be a misunderstanding of the different types of acquisition referred to in the last paragraph of page 1 of the Fact Sheet. The first sentence explains that, given the ownership situation, condemnation cannot be used to acquire land in fee. That is, condemnation may not be used to purchase all right, title and interest in land within the designated area. In these circumstances, fee title could be acquired only from willing sellers or through land exchange. However condemnation could be used to acquire a partial interest (such as an easement or right of use), and this is what the Fact Sheet was referring to.

56 CONCERN THAT A RECREATION RIVER DESIGNATION AND MANAGEMENT OF THE SEGMENT OF THE WENATCHEE RIVER WITHIN TUMWATER WILL NOT ADEQUATELY PROTECT THE SCENIC VALUES OF THE CANYON. THIS CONCERN APPEARS TO BE BASED ON THE FACT THAT THE LONGVIEW FIBRE CO., AN INDUSTRIAL FOREST LAND OWNER, OWNS AND MANAGES A SIGNIFICANT AMOUNT OF LAND COMPRISING THE CANYON WALLS ABOVE THE RIVER.

COMMENTS INCLUDED:

“Upon your acquisition of the Longview Fibre Lands you will own NINETY FOUR percent of the river shore land in the canyon. I feel your effort to date has been misleading since you have not openly informed the public that you are and have been negotiating with Longview Fibre to acquire their land. The National river designation is not the vehicle to protect the scenic values of the canyon walls. The designation only affects the corridor 1/4 mile from the river. If you do not acquire the Longview Fibre Lands, by exchange, your staff will be guilty of having misled the public, since the upper portion could still be logged!!”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0152S, 2021S

FOREST SERVICE RESPONSE:

The Wenatchee National Forest has been involved in a much publicized land exchange program with the Longview Fibre Company since 1984. One large exchange was completed this past winter. A second large exchange is now nearing completion. This second exchange includes the lands which the company owns within the Tumwater Canyon. The acquisition of these particular Longview Fibre Company lands is not connected with the designation of this segment of the Wenatchee as a Recreational river. However, one of the purposes is to protect some of the scenic values within the canyon. Hence, the acquisition would compliment a Recreational river designation.

57 INCLUDING RIVERS IN THE WILD AND SCENIC RIVERS SYSTEM ADVERSELY AFFECTS THE AVAILABILITY OF MINERAL RESOURCES.

COMMENTS INCLUDED:

“Designating a river segment as part of the Wild and Scenic River System can have adverse effects on the availability of public lands for mineral exploration and development.”

“The upper scenic portion of the American River and on up into Morse Creek even though it has been prospected and small scale mining has gone on since the 1930’s; it is still scenic... I think these areas would be more appropriately designated “scenic with mining history” where people cannot only enjoy the natural beauty but expect to see people looking for gold in the stream.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0004S, 1078S, 1577S,

FOREST SERVICE RESPONSE:

As indicated in the suitability study in Appendix E of the FEIS, only those rivers designated as Wild rivers are withdrawn from mineral entry (including a corridor 1/4 mile each side of the river). Since those segments on the Wenatchee National Forest which qualify for “Wild” designation lie within wilderness areas that are already withdrawn from mineral entry, designation would have no new effect on the availability of mineral resources. In addition, prior existing valid claims would be permitted, to the extent these are consistent with the wilderness restrictions, and subject to protective measures under 36CFR228.

River segments designated as Scenic or Recreational would remain open to mineral entry, and mineral exploration and development would be provided for in the management plan adopted for such rivers. This would include panning, sluicing, recreational collecting, prospecting, and mineral exploration and development activities conducted in an environmentally acceptable manner. Finally, a rich mining history would be one of the river values identified in the eligibility determination for designation of a Wild and Scenic River.

58 MINERAL RESOURCES HAVE NOT BEEN APPROPRIATELY EVALUATED PRIOR TO A MANAGEMENT DECISION.

COMMENTS INCLUDED:

“A detailed minerals evaluation has not been completed but is necessary to determine the mineral potential of these river corridors prior to a management decision. Once this process is completed, areas identified should be omitted from proposed scenic and recreational classification.”

“No recognition has been made of the value of these public lands as historical and traditional mining areas, where concentrated mineralization still provides opportunity not only for prudent mineral strikes but public prospecting, which for most is a recreational outlet as well.”

“I also note on page E-23, fourth paragraph down that mining activities will be addressed after a river is classified. I think that kind of leaves a recreational miner in the position of not supporting your proposal or the Act.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0004S, 1078S, 1577S,

FOREST SERVICE RESPONSE:

A Suitability Analysis is completed prior to making a recommendation to include a river as part of the Wild and Scenic River System (see Appendix E of the FEIS). As part of that analysis, existing literature, information made available by the public, and records concerning mineral resources and mineral resource activity are considered. However, unless the Suitability Analysis indicates an area has a very high potential for the occurrence of mineral resources, an on-the-ground detailed mineral resource evaluation is normally not completed before making a recommendation. This is especially true in segments recommended for a Scenic or Recreational designation, where new mining activity is permitted.

59 THERE IS CONCERN OVER THE POTENTIAL EFFECTS OF A WILD AND SCENIC RIVER DESIGNATION ON A FUTURE SATELLITE FISH REARING FACILITY.

COMMENTS INCLUDED:

“The Chelan County Public Utility District (PUD) owns Tumwater Dam on the Wenatchee River and is the proponent of a proposed satellite fish rearing facility at the confluence of the Chiwawa and Wenatchee Rivers. Future development of this project could be affected or fettered by including, as “recreational” these reaches of rivers in the Wild and Scenic Rivers System. The purpose of these facilities is clearly consistent with promoting the objectives of the Wild and Scenic Rivers Act. The PUD would appreciate discussing these concerns with the Forest before completion of the FEIS.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

1573S

FOREST SERVICE RESPONSE:

The Forest is aware of the proposed satellite fish rearing facilities and is currently working with the PUD in developing an Environmental Assessment for a special use permit to construct and operate such a facility. The satellite facility has been described in the latest Eligibility and Suitability Analysis and is included in the FEIS (Appendix E). It is believed this facility and other potential fisheries enhancement projects are fully compatible with the Recreational river classification.

60 ACQUIRE PRIVATE LANDS TO ENSURE PROTECTION OF RIVER VALUES

COMMENTS INCLUDED:

“Acquire the private timber lands in Segment II of the Cle Elum River (bridge to wilderness boundary) to protect the river qualities.”

“Until recently, the U.S.F.S. has taken no interest in acquiring lands in the Icicle Creek area, and now the best that could happen would be a blend of private and Governmental ownerships that would allow residential development while protecting public interests. I think that this could be accomplished by the following steps:

1. The Federal Government should acquire fee title to the bed of the stream along the whole creek to Snow Creek Trail bridge.
2. The Federal Government should acquire fee title to the land between the main road and the creek down to the bridge.
3. The Federal Government should acquire fee title, by purchase or trade, to large blocks of undeveloped land such as Mount Cashmere, Lake Caroline, Little Eight Mile, Trout Creek, Rat Creek, Victoria Creek, and others.
4. The Federal Government should acquire fee title to those lands not between the main road and Icicle Creek that currently have public recreational uses, such as:
Snow Creek Trail Head.
Icicle Buttress.
Rat Creek boulder with an easement, and also an easement to Rat Creek Towers.
Fourth of July trailhead...”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

1212S, 2172S, 2273S

FOREST SERVICE RESPONSE:

The Forest Service is not a land acquisition agency. Generally speaking, purchases, donations or exchanges are entered into when such action is necessary or beneficial for administration and public use of the National Forests. This includes acquiring land to consolidate the National Forests, to improve resource management, and to obtain land needed for administration or research purposes. Land is not acquired simply to increase the size of the National Forest's holdings or to keep it from private development.

Although the Wild and Scenic Rivers Act has provisions for some land acquisition, the Forest has no foreseeable plans to acquire lands or interests in lands along any of the proposed rivers in connection with Wild and Scenic River designation, with the exception of a 200 foot right-of-way near Plain. As stated in Appendix E of the FEIS, acquisition of easements from private landowners would occur only if key values were in jeopardy and local government could not provide the necessary protection. It is our intention, instead, to rely on State and County controls for administration of the private lands and protection of the significant river values.

61 STATEMENT THAT NO PRIVATE PROPERTY EXISTS IN THE SEGMENTS OF THE ENTIAT RIVER PROPOSED FOR DESIGNATION IS QUESTIONED

COMMENTS INCLUDED:

“Your supplement indicates your proposed ‘Wild and Scenic’ designation for the Entiat River starts at Burns Creek and that there is no private ownership land in the proposed area. However, the area on both sides of the Entiat River up river (west) from Burns Creek to the ‘Entering the Wenatchee National Forest’ sign (over 30 parcels of land) is privately owned.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0416S

FOREST SERVICE RESPONSE:

Our description of the lower boundary of the corridor in the Supplement may have led to some confusion. It was and continues to be our intention to end the corridor at the private land boundary above Burns Creek, so that no private holdings will be included within the segments of the river that are proposed for designation. This description has been clarified in the FEIS.

62 OPPOSE DESIGNATION OF THE ENTIAT RIVER

COMMENTS INCLUDED:

“...opposed to designation of portions of the Entiat as ‘wild and scenic’.”

“...continue multiple use availability of the land as it is now.”

“...costs of management under this proposal cannot be justified.”

“Although the Wild and Scenic Rivers Act of 1968 is intended to preserve the river and its immediate environment, it is clear that your intent is to eliminate the traditional motorized use on the Entiat River Trail.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

FOREST SERVICE RESPONSE:

Our evaluation of the Entiat River identified outstandingly remarkable scenic values along the river corridor, on which basis we determined the upper segments of the Entiat to be eligible for designation as a Wild and Scenic River. Following this determination, the Forest conducted an analysis of the suitability of the Entiat for inclusion in the National System, which is documented in Appendix E of the FEIS. Suitability looks at several factors, including land ownership patterns, current and future uses, the river values to be protected, costs associated with designation and public response to designation. After careful consideration of all of these factors for the Entiat, the Forest determined that the benefits of designation outweighed any disadvantages that might exist. However, it is important to note that designation does not preclude continued multiple use within the corridor, as long as these uses are consistent with the management prescriptions for the area, and are carried out with sensitivity to the outstandingly remarkable river values that exist here.

63 SLOW DOWN TIMBER HARVESTING IN THE CLE ELUM DRAINAGE

COMMENTS INCLUDED:

“Slow down timber harvesting because of possible damage to the Cle Elum River.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0706S

FOREST SERVICE RESPONSE:

Timber harvesting is allowed on Federal lands only after meeting the requirements of the National Environmental Policy Act (NEPA). The Act requires not only an assessment of the direct impacts resulting from timber harvest on the resources and lands within the area of undertaking, but also an analysis of the cumulative effects on Federal lands that may occur as a result of harvesting on adjacent private lands. However, we have no jurisdiction over the schedule or location of harvesting by private landowners.

64 CONCERNS WITH THE IRRIGATION DAM AND CANAL ON THE ICICLE RIVER

COMMENTS INCLUDED:

“The district has concerns about its canal and dam in and along the Icicle River, the maintenance rehabilitation, and the operation and maintenance, etc. The district has vested rights for ingress and egress and serves 7,500 acres of land.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0023S

FOREST SERVICE RESPONSE:

In response to these concerns, we reexamined our original analysis of the lower segment of the Icicle. Because of the presence here of the irrigation facilities as well as the City of Leavenworth water intake, it appears that the highest potential classification of the lower 2 1/2 miles of that portion of the Icicle above the Forest boundary is Recreational. Furthermore, as a result of our reassessment, we are not recommending this 2 1/2 mile segment (below the center of Section 28, T.24N., R.17E.) for designation because of the potential future irrigation and municipal water supply needs.

65 WHERE IS THE LOWER BOUNDARY OF THE PROPOSED WENATCHEE RIVER CORRIDOR?

COMMENTS INCLUDED:

“Your document appears defective and your staff has misled the Leavenworth Residency. In the text, you identify the river segment for the ‘taking of private rights’ to be from the confluence of the Wenatchee and Icicle Creek to Lake Wenatchee...Later in the text and especially at the public meetings you say, well we really want to talk about from the mouth of the Canyon to Lake Wenatchee. NOW WHICH IS THE TRUE BOUNDARY???”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

2021S

FOREST SERVICE RESPONSE:

We are sorry if the descriptions of the Wenatchee River boundaries have caused some confusion. Our initial study examined the physical characteristics of the Wenatchee River between Lake Wenatchee and the mouth of the Icicle Creek, since this latter spot marked a notable change in the character of the river corridor. However, our full Eligibility and Suitability Analysis in Appendix E of the FEIS is directed to that portion of the Wenatchee River between Lake Wenatchee and the National Forest boundary in Tumwater Canyon. We are proposing for designation only those segments of the river above the National Forest boundary.

66 CONCERN THAT DESIGNATION WILL RESULT IN UNDESIRABLE IMPACTS FROM PUBLIC USE

COMMENTS INCLUDED:

“Designating the Tumwater Canyon into the national river system will create a higher impact and use demand on an already over crowded and impacted river.”

“For recreation management practices, you need additional evaluation to determine the impact of users...Does designation of a landmark or natural resource enhance its value or does it invite destruction?”

“My husband who takes many walks through the National Forest lands next to us here on the river informs me that he has put out several campfires that their users failed to extinguish before they left these unimproved campsites. He has picked up cans and bottle debris left by these unconcerned and careless campers. Should the Forest Service build sanitary stations along the shores of these `protected' rivers, it is our definite fear that only more debris and forest fire danger will prevail. Will the Forest Service provide complete protection through more frequent patrols and restrictions on the boating campers who use these lands? (Right of way or access corridors across private land creates an opportunity for trespassers to vandalize and create problems for the owner.)”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0068S, 0087S, 0215S, 1186S, 1253S, 1309S, 1373S, 1574S, 1576S, 1577S, 1580S, 1582S, 2014S, 2018S, 2019S, 2021S, 2055S, 2191S, 2246S, 2247S, 2363S,

FOREST SERVICE RESPONSE:

We appreciate the concern with the effect river users may have on the local river area. It is our belief that the Forest Service will be better able to direct public use, provide necessary facilities, and reduce the problem areas along these rivers if they are officially designated. Development of detailed management plans after designation of specific rivers will address, on a site specific basis, where, when, and how certain facilities should be provided. We would also address the number of users that a particular river or segment could accommodate without causing environmental damage or undesirable impacts on private landowners. We do not anticipate the need to develop access or facilities on private land.

67 THERE IS AN ERROR IN THE INFORMATION FOR THE WENATCHEE RIVER

COMMENTS INCLUDED:

“You have biased your report by alluding that Thousand Trails development is on the Wenatchee River. In fact, it is not even in the corridor of the Wenatchee River!”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0423S, 0697S, 0717S, 1260S, 1261S, 2021S, 2049S, 2059S, 2060S

FOREST SERVICE RESPONSE:

We mistakenly included the Thousand Trails development in the Wenatchee River corridor. It is actually within the Chiwawa corridor, and we have amended our analysis in Appendix E of the FEIS accordingly.

68 THERE IS A NEED FOR BETTER PARKING FACILITIES AND ACCESS TO THE WENATCHEE RIVER AT SPECIFIC LOCATIONS

COMMENTS INCLUDED:

“As for the recreational access to the Wenatchee River, there remains a problem. There are two popular rafting trips down the Wenatchee River. One is a three hour trip from the Headwaters to the State Highway 209 bridge in Plain; the second is a three hour trip from the same bridge to the Tumwater Campground. Both are very easy trips, and are usually done without river guides. The problem is, that the only public access in Plain is under the State Highway bridge. The parking is limited and dangerous - one fatality has already occurred there. There is no adequate public access to the Wenatchee River in Plain. I am proposing that the Public Utility District land, just north of this bridge, become a day park for public access. I have presented this plan to the P.U.D. Commissioners with a favorable response, but they are not willing to finance the project on their Exhibit R program. They are, however, holding the property until our community can organize a financial plan. I have acquired local support for the idea from many people, but there are several unanswered questions when it comes to actual finance.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

2191S

FOREST SERVICE RESPONSE:

We agree that the Wenatchee River provides excellent recreational opportunities. We are also aware of the P.U.D. property in Plain and a parcel of National Forest land directly across the river that is well located to provide a take-out/put-in facility for rafters. The management plan that would follow designation of the Wenatchee River would be an excellent vehicle through which we can evaluate needs and alternatives for recreational development of either piece of land.

69 SOME RIVERS ARE CLASSIFIED TOO HIGH FOR THEIR EXISTING CONDITION.

COMMENTS INCLUDED:

“The Chiwawa River does not meet my idea of a scenic river. About the only `scenic' view one has of these rivers is at developed recreation sites. I would suggest that the roaded access of this river continue past management trends of enhancement of developed and dispersed recreation. Thus all fitting the classification of recreational.” (This response also included the same comment for the White River and Little Wenatchee).

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0002S

FOREST SERVICE RESPONSE:

There appears to be some confusion over how the determination of Scenic versus Recreational classification is made. An important variable to remember is that the attributes of a river are determined from the river itself and not from adjacent facilities such as roads, bridges, or campgrounds. In addition, the terms "Scenic" and "Recreational" do not so much refer to particular scenic or recreational values along the river corridor as they do to the condition of the river and adjacent lands, and the level of development and range of activities permitted within the corridor at these levels of classification.

With this in mind, we still believe that the section of the Chiwawa between Trinity and Goose Creek meets the standards for a Scenic level of classification. However, in the preferred alternative we are recommending that this section be designated as a Recreational river because of anticipated plans for recreational developments and use of National Forest lands within the corridor, as well as plans for proposed in-stream fisheries enhancement structures and improvements.

70 CONCERNS REGARDING THE CLASSIFICATION AND DESIGNATION OF THE NAPEEQUA

COMMENTS INCLUDED:

"The lower Napeequa clearly should be a scenic river. The more important question is: why is it ineligible for wild river status? The answer, unfortunately, is the Forest Service has either ignored or promoted a very unwise and ecologically disastrous 'summer home' development along the lower Napeequa. At present, the results are, A) buildings in a flood plain, too close to a previously wild river, B) forced rerouting of a hiking trail so that the public is denied access to the scenic river (with No Trespassing) signs prominently displayed, and C) frivolous use of riprap by individuals who have no desire to preserve the values of a wild river. At this late date, the best way to control further destruction would be scenic designation for the lower Napeequa."

"There is now in existence, and has been since 1967, a 51 lot subdivision of 26 acres on the South and West shores of the Napeequa, in the Segment 1 area. This subdivision includes approximately the same amount of this shoreline as the Presbyterian Church Camp. The Church Camp owns 130 acres total, but much of it bordering the White River. This subdivision has a community water system, of 6 inch steel lines, hydrants and 20,000 gallon storage, furnishing 65# pressure on the system. There is underground power to all the lots. Approximately half of the lots have been developed with summer homes and trailer sites."

"The Napeequa River in Segment I contains a significant amount of riprap along the south bank, both on the Tall Timber Ranch property and along the private homeowners' lots above Tall Timber Ranch."

"I am concerned that the Forest Service may desire to acquire access rights through Tall Timbers Homeowners for access to the lower Napeequa. Trespassers have become downright indignant when advised they are on private property. I foresee serious confrontations requiring County Sheriff involvement if access rights are granted through the Homeowners area."

“I strongly suspect that the only reason this small section of all private land (on the lower Napeequa) has been included in the Scenic River system is so that the Forest Service can at a later time take part of this private land away from us for the general public.”

“The Supplement to the DEIS on page E-59 says about the Napeequa River, that future expansion of Tall Timber Ranch would not likely be affected, ‘if the church intends to maintain the present rustic theme.’ It also adds on page E-55 about the White River that Scenic designation through ‘private land could affect future development.’ This is a major concern in light of the realization that all of Tall Timber will be inside the designated Scenic River area. Tall Timber Ranch has a Long Range Master Plan which shows what future plans are to be developed...The Tall Timber Ranch Master Plan includes a new camping facility along the shores of the Napeequa River, and two bridges across the Napeequa River. There are already two bridges present. There is also a new lodge, an RV area, and several other buildings.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0003S, 0008S, 0009S, 0010S, 0012S, 0013S, 0014S, 0015S, 0016S, 0027S, 0031S, 0079S, 0095S, 0100S, 0171S, 0203S, 0217S, 0226S, 0316S, 0409S, 0465S, 0474S, 0682S, 1120S, 1182S, 1227S, 1374S, 1421S, 1577S, 2084S

FOREST SERVICE RESPONSE:

The lower Napeequa (Segment 2) flows exclusively through private land, over which the Forest Service has no jurisdiction. Although we were aware of the Tall Timber Homeowners subdivision as well as the Tall Timbers Church Camp, these were not adequately addressed in the Supplement to the DEIS. We also overlooked the riprap and some other improvements in existence at the time of the analysis. Based on this new information, we reassessed the highest potential classification of the lower mile of the Napeequa and now believe it meets the standards for a Recreational rather than a Scenic river. This level of classification allows for new structures, cluster residential developments and intensive recreation use. We also feel that the Chelan County Shoreline Master Program provides adequate protection of the river values through this portion of the corridor, and do not anticipate imposing additional controls. An analysis in Appendix E of the FEIS has been amended accordingly.

With respect to the public access issue, we recognize the concern of private landowners about the potential for trespassing and damage to private property, and have no intention of acquiring public access rights or easements through the private holdings in the lower Napeequa. As mentioned in some of the comments received on this subject, the Forest Service relocated the Twin Lakes Trail away from the private land several years ago. The trailhead is well marked on the main White River road and most people use this facility for access.

71 WHITE RIVER DESCRIPTION DOESN'T APPEAR TO BE ACCURATE

COMMENTS INCLUDED:

“You mention livestock grazing on the Chirwawa but not the White River (the Gray property is grazed by 30 to 40 head of beef and breeding stock from June through October each year). You seem to be unaware of riprap work on the White...”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0409S, 1577S

FOREST SERVICE RESPONSE:

We mistakenly omitted references to grazing in the White River, as well as to the riprap work. This has been corrected in the Appendix E analysis. In addition, all uses and improvements described in the comments received have been evaluated and determined to be consistent with a potential Scenic classification of the White River.

72 SUPPLEMENT HAS ERROR IN INFORMATION CONCERNING LOCAL INTEREST FOR DESIGNATION OF THE LITTLE WENATCHEE

COMMENTS INCLUDED:

“I found a statement in the Supplement to the DEIS, page E-51, that claims that `there has not been any local interest expressed for the designation of the Little Wenatchee River’. For the record, I ask you to PLEASE read again my letter #0563 of September 2, 1986.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0178S

FOREST SERVICE RESPONSE:

The initial interest in the proposed designation of the Little Wenatchee River was low. However, since publication of the Supplement, there has been a tremendous increase in the responses supporting designation of the river. Appendix E of the FEIS has been amended to reflect this change.

73 THE LITTLE WENATCHEE RIVER SHOULD BE DESIGNATED TO PROTECT THE OUTSTANDING SOCKEYE SALMON RUNS

COMMENTS INCLUDED:

“The Lake Wenatchee System is the ONLY example of a Sockeye Salmon spawning area occurring entirely within the boundaries of the Wenatchee National Forest. Estimates are that of all the Sockeye Salmon to use the Lake Wenatchee drainage system, approximately 25% spawn in the Little Wenatchee River.”

“In regards to the statement that the Little Wenatchee River’s `one outstandingly remarkable feature (the Sockeye run) is confined to the river’s first eight miles, and that feature is much better represented by the nearby White River,’ I feel that the intent of the Wild and Scenic Act was not to be an either/or situation and therefore, both drainages should receive highest status recommendations from the Forest Service. I urge you to reconsider your decision.”

“Your WSR study team found the Little Wenatchee eligible for designation but not suitable because it was not the best example of a sockeye salmon producing river in the area. The WSR Act does not restrict the number of eligible rivers that can be nominated for inclusion in the WSR system, nor does the Act restrict inclusion to the ‘best examples’...To arbitrarily omit from WSR consideration the Little Wenatchee which possesses such a rare feature is indefensible.”

“Because the White River is glacially fed, it is also on the average, several degrees cooler than the Little Wenatchee during spawning periods and herein lies an important reason why the Little Wenatchee needs extra protection. The dangers of increased silting, lower streamflow and higher water temperatures are just too great for this delicate habitat. Reduced water retention in springtime, created by timber harvesting, can only result in reduced water levels in the autumn, during the sockeye spawning season. These reduced streamflows increase water temperatures with the resulting rise in bacteria and algal growth. In the summer of 1987, I noticed for the first time, large areas of algae in the shallows of the Little Wenatchee. I don’t know the reason for this prolific bloom, but I can guess that it may have been the result of post-harvest fertilizing.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0178S, 0334S, 0498S, 0691S, 0693S, 1124S, 1162S, 1181S, 1212S, 1308S, 2050S, 2181S, 2315S,

FOREST SERVICE RESPONSE:

We agree that the sockeye salmon run is outstanding and we accordingly recognized this value in the Supplement. We also realize that the Wild and Scenic Rivers Act does not restrict designation solely to the best examples of an outstandingly remarkable feature. However, we have made the decision to manage the Little Wenatchee for commodity use, and believe that we can effectively manage the sockeye habitat through other land allocations and management prescriptions within the river corridor (see the Management Prescriptions and Forest-wide Standards and Guidelines in Chapter IV of the Forest Plan).

We do not know why recent algae blooms have occurred in the shallow areas of the Little Wenatchee River. We do know that fertilizers have not been used in many years in the Little Wenatchee or White River drainages and it is very unlikely that past use would have been the cause. Water quality monitoring in the rivers and lake is being conducted. We suspect that recent drought years resulting in lower than average flows into the lake have contributed to the problem. The resulting lack of turnover in water volume in the lake combined with nutrients leaching into the water from lakeside areas has made it more susceptible to algae blooms.

ARCHAEOLOGY, HISTORIC/CULTURAL AND INDIAN RIGHTS

74 THERE IS CONCERN FOR PRESERVATION OF THE NACHES TRAIL

COMMENTS INCLUDED:

“The Naches Pass Trail is probably one of the most important historic sites in Washington State.”

“A road with a hedge along it, even if in natural growth, would not reflect the historic character.”

“Naches Trail as an educational resource: The goal of this use is to give Washington State school children a unique opportunity to re-enact their State’s history by walking the Summit portion of the trail in September and early October of the school year.”

“I have not seen any reference to the historical value of the Naches Pass area. It has substantial historical value and should be preserved in its natural state. The Naches Pass Trail should be maintained as a foot and horse trail only—with perhaps a few interpretive signs.”

“We support establishing a Naches Pass National Historic Park, to preserve and interpret the historic wagon trail, Native American use, and later livestock and recreational use. Approximately 10,000 acres... would be included and managed by the National Park Service. Until that happens the areas should be managed as a special area, private lands acquired and its roadless character retained.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDED:

2768, 2800, 4477

FOREST SERVICE RESPONSE:

Significant cultural resources receiving protection through designation as Classified Special Areas were not specifically listed in either the Environmental Impact Statement or the Forest Plan. For some of these resources, public awareness of site localities may lead to vandalism and site theft. Most of the cultural resources receiving such designation are also small in areal extent and they do not appear at the scale of maps printed with the Environmental Impact Statement. However, the Naches Trail covers a much larger area and therefore does appear on the scale used for the maps.

The Naches Trail will be protected under the Preferred Alternative through designation as a Classified Special Area - Other with the SI-2 Prescription (see Chapter IV of the Forest Plan). However, the Trail passes through three sections of privately owned land where management is not affected by this plan. On National Forest Land, only those uses which are compatible with the management objectives of the Special Area are allowed. In addition, this prescription directs that any existing impacts of public use and the special features designated for protection will be corrected. The Naches Trail is one of the earliest 4x4 trails established in Washington, dating from just after World War II when jeeps first became readily available. This use will undoubtedly continue, but needs to be properly managed in order to protect the historic features of the Naches Trail. Scheduled timber harvest is not allowed within these areas, although some cutting may occur if it is determined to be compatible with management direction for the Trail or that it will enhance the special features of the area. Generally, in order to protect the surrounding setting associated with significant cultural resources, the SI-2 Prescription is drawn to include at least the visual foreground as seen from the special features of the area. SI-2 designation also would allow for recreation and interpretation of the special features if this is compatible. However, both the Preferred Alternative and Alternative I surround the SI-2 designated area with General Forest allocations which emphasize timber harvest, thus areas seen at a distance from the Naches Trail may appear slightly to heavily altered.

Please also read the following response for a more detailed discussion of the process the Forest Service uses to ensure significant sites are protected.

75 THERE IS CONCERN FOR PRESERVING CULTURAL RESOURCES

COMMENTS INCLUDED:

“Existing fire towers (lookouts) should be maintained indefinitely as shelters. If this is costly to the Forest, outdoor groups are often willing to share the maintenance responsibilities. Indeed, application for placement of these structures on the National Register of Historic Places is appropriate.”

“Old stockmans cabins and trapper shelters/cabins should be preserved for historical value.”

“I have been shown several remnants of old trails used by Indians and early emigrants to the NW which are located between Lake Kachess and Snoqualmie Pass. These sites need to be designated as “special areas” (SI-2) and have not been addressed by the DEIS or the Management Plan.”

“Wenatchee River `Snow Place:’ house pits for cultural historic classification. Several Indian house pits next to the Wenatchee River and terraces. Unique in the pits’ large sizes and shapes. This area is in Recreational River classification within riparian areas and commercial forest lands. There are many threats to disturbance through timber harvesting and to recreational `pot hunters.”

“Raging Creek `Indian-Army Battle Site:’ for cultural historic classification. This is a very special place to the Colville Indians (Wenatchee Natives moved to Colville). A large grave site from the late 1800s is located in the area, as well as camp sites, berry fields, and trails. Very rich in cultural. It is in commercial forest classification.”

“Retain the old cabins and camp sites of our trappers, stockmen. This is part of the history of the north-west.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDED:

0484, 1947, 2744, 2750, 2800, 2807, 2858, 2879, 3862, 4462

FOREST SERVICE RESPONSE:

The goal of the Wenatchee National Forest’s cultural resource management program is to preserve the historical, cultural, archaeological, and/or architectural values of significant cultural resources for the benefit of the public through a program providing identification, protection, interpretation and management. As with all Federal agencies, the Forest Service is directed by various Congressional acts and their implementing regulations to consider all cultural resource values before undertaking actions which may affect these resources. Both Executive Order 11593 and the National Historic Preservation Act, as amended, direct that Federal agencies act cautiously and treat all cultural resources as though they are eligible for listing in the National Register of Historic Places until an evaluation of the site’s significance can be made.

This process is usually carried out by conducting an inventory or survey of the areas which may be impacted by a proposed project. This inventory is conducted using the methods outlined in the Forest’s professionally designed inventory plan. When cultural sites are located, they are recorded and generally protected so that the project’s activities will not impact the sites. If a site cannot be avoided then its significance is evaluated by a professional using the National Register criteria for evaluation. If the site is determined to be significant then alternatives are considered which will avoid, lessen or mitigate the impacts of the project on the site. During this entire process, consultation is undertaken with the State Historic Preservation Officer and the Advisory Council on Historic Preservation, agencies whose mission is preservation and protection of cultural resources. With their help, the Forest Service determines the

best course of action for management of the cultural resource. This will vary on a case-by-case basis

The specific sites and locations mentioned in public comments are protected through implementation of the process outlined above. This process is also part of the Forest-wide Standard and Guidelines listed in Chapter IV of the Forest Plan and therefore applies to all areas of the Forest, no matter what the management prescription is for any particular area.

76 ADEQUACY OF CULTURAL RESOURCE INVENTORY AND PROTECTION

COMMENTS INCLUDED:

“The document adequately considers known and anticipated cultural resources and the potential for impact to these. The precautions proposed to identify cultural resources and to avoid or mitigate anticipated impacts to identified or unidentified cultural resources are adequate.”

“How many timber sales have been done without cultural resource inventories since 1980? What is the current budget for cultural resource inventory staff. It states that at the present rate, cultural inventory work will proceed at the rate of about 27,000 acres per year. That averages out to 74 acres per day. Please explain how, with your current staff, you can carry out an acceptable cultural resource inventory covering 74 acres each day?”

“A more complete and exhaustive inventory of cultural resources should be made before development in any area is planned.”

“Alternative E [and F]: cultural resource management is lacking.”

“To accomplish the monitoring mitigation and interpretation noted, funding will have to be committed to this program. The funding in past years does not meet the needs. This falls in line with the Forest Plan Monitoring Plan. Funds are required, a commitment is required by the Wenatchee National Forest.”

“The Cultural Resource Program should define and inventory traditional use zones and archaeological sites independent of timber harvest activities. Other uses, e.g. motorized vehicles, grazing, wilderness, recreational, etc. do in fact have a significant impact on archeological sites and traditional use areas... The Yakima Nation feels many of the archeological sites outside of these timber harvest areas, mute testimony of past use are being destroyed. Furthermore this narrow approach has made no meaningful attempt to inventory and evaluate traditional use areas.”

“The Wenatchee Forest Plan and DEIS constitute an impressive, up-to-date summary of the Wenatchee National Forest program for identifying, evaluating, protecting and interpreting to the public its cultural resources. For cultural resource planning beyond the project level, this program may well have potential to serve as a model for other forests.. Complete implementation of the Wenatchee cultural resource program would be expected to produce highly desirable results for the Wenatchee National Forest.”

0035, 0062, 0347, 2201, 2732, 2789, 2800, 2849, 2877, 2878, 2879, 3862, 4434, 4467, 4487, 9094

FOREST SERVICE RESPONSE:

Management of cultural resources is discussed in each of the alternative descriptions in Chapter II of the FEIS. The current situation of cultural resource management on the Wenatchee National Forest is described in Chapter III of the FEIS and Chapter II of the Forest Plan. Please refer to these sections for further information about the program.

The Wenatchee National Forest carries out its cultural resource management program with a cadre of professional archaeologists and professionally trained and certified Cultural Resource Technicians. In 1988 this cadre totalled 24 full-time employees and ten seasonal employees. The program is directed by one full-time Forest Archaeologist who reviews all cultural resource work conducted at the District level by the 28 Cultural Resource Technicians and five archaeologists. Reviews ensure that work meets the Forest-wide Standards and Guidelines listed in Chapter IV of the Forest Plan and professional quality needed to adequately document all cultural sites located and the efforts made to identify them. Further investigations are carried out by the Forest Archaeologist with District personnel as needed to ensure the best protective measures for cultural sites located. Reviews also occur to ensure that cultural resources are adequately considered in all projects which may potentially affect a cultural site.

In 1988, the Forest accomplished an inventory of lands for cultural resources totalling more than 80,000 acres. Lands inventoried for cultural resources are most often those proposed for timber sale activities simply because the preponderance of ground disturbing projects are timber sales. However, all projects that may potentially impact a cultural site are inventoried. These include such actions as campground expansion or construction, trailhead construction, and range structure construction. Even several thousand acres of Wildernesses have been surveyed, primarily to determine the historic value of small structures which predate wilderness classification. This inventory is guided by a professionally designed inventory plan. The purpose of this plan is to efficiently use time and effort in areas where prior knowledge indicates cultural resources may be located (through historic records, District files and interviews with local informants, and our knowledge of the subsistence and settlement patterns of the Indians). As more sites are found, the inventory plan is fine-tuned to reflect new information. For example, recently the physical remnants from huckleberry drying activities were found on a neighboring National Forest. This information broadens the range of physical evidence that is then considered during field surveys.

Quite frequently, but not always, areas that are known to have been used traditionally by this area's Indians do have physical evidence of this use left behind. For those areas and resources that do not contain such evidence, we must depend on Indian advice concerning these locations and their importance to the Tribe. Thus far, although several of these traditional use areas are known through historical research, the Indians have been reluctant to share information on specific localities. Only continued, frequent communications between the Tribes and the Forest will help to alleviate this problem. It is believed that the Forest-wide Standards and Guidelines and the Monitoring Plan listed in Chapters IV and V of the Forest Plan will provide the flexibility needed to protect areas of importance to today's Indians.

It is also true that funding in the past has not been adequate to carry out a fully functional cultural resource management program. National and Regional direction and emphasis have changed dramatically in recent years, and it is hoped that the Forest Plan reflects this change (more emphasis on public benefits through interpretation). However, it is up to Congress and the President to ultimately determine the level of funding for the Forest. The cultural resource management program will be adjusted accordingly using direction contained in the Forest Plan to determine funding priorities.

77 FAILURE TO RECOGNIZE AMERICAN INDIAN TREATY AND RELIGIOUS RIGHTS

COMMENTS INCLUDED:

“Not only does the plan admit that there will be irreversible impacts on cultural resources as yet unknown, the plan totally neglects to consider decisions such as the G-O Road in the Six Rivers National Forest (1983) whereby areas considered sacred to Native peoples are protected under the First Amendment.”

“Is there no way to protect more acres of American Indian land. We would not dig up cemeteries or destroy churches belonging to white communities, so why can't we respect their spiritual needs also.”

“Federal agencies owe a duty to refrain from activities that will interfere with the fulfillment of treaty rights. Moreover, this duty cannot be performed by engaging in an ‘accommodation’ or ‘balancing’ process between Indian treaty rights and a competing economic interest such as timber harvest. Any such ‘accommodation’ reached by the Forest Service would amount to a de facto abrogation of Indian treaty rights.”

“We especially appreciate the extensive recognition of and reference to the unique relationship that exists between the Forest, the Yakima Indian Nation, and other affected tribal groups. In no other forest plan that we have reviewed has the Forest Service's obligation to meet treaty rights been so plainly acknowledged.”

“A major legal and conceptual problem with the Wenatchee National Forest Forest Plan lies in its failure to recognize responsibility for all of the resource rights retained by the Yakima Indian Nation under the Treaty of 1855.”

“We find no land allocations of traditional resource areas and no discussion of how these various land use categories will affect the Nation's reserved resource rights. This is a major oversight particularly in the Draft Environmental Impact Statement.”

“The Wenatchee National Forest should introduce any and all kinds of food bearing plants what might thrive in the area that is set aside for us to use.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDED:

0062, 2730, 2891, 4485, 4486, 4487, 0090S

FOREST SERVICE RESPONSE:

American Indian Treaty and religious rights are discussed extensively in the FEIS. Treaty rights, and traditional and religious uses of the Forest are discussed for each of the alternatives in Chapter II. The effects of the alternatives are detailed in Chapter IV. The effects of the alternatives on Treaty and religious resources vary, depending on the resource. Generally, the Preferred Alternative will have a beneficial effect on huckleberry production and will retain current levels of big game habitat and fish habitat. No change is expected in the availability of edible and medicinal plants. Chapter III of the FEIS discusses in detail the nature of Treaty rights and traditional religious use. It also notes that the Indians have been reluctant to reveal traditional religious use areas to the Forest Service. Without this information it is impossible to protect or allocate protective prescriptions (such as the Classified Special Area - Other (SI-2) Prescription) to these areas at this time. We believe, through on-going coordination during specific project planning, that the Indians' concerns for specific areas can become known and addressed

in project plans. The Forest is committed to assuring continued access to traditional resource and religious use areas on Federal lands. The effectiveness of protecting such areas, once they have become known, will be closely monitored and evaluated as described in Chapter V of the Forest Plan. The reader is referred to Appendix G of the Environmental Impact Statement where the Yakima Treaty of 1855 and the American Indian Religious Freedom Act are displayed.

Because these rights are extensively discussed in the Environmental Impact Statement, the Forest Plan only discusses them as they relate to implementation of the Forest's Preferred Alternative. A section on Treaty and religious rights has been added in the Social/Economic section of Chapter II of the Forest Plan and Chapter IV includes those Standards and Guidelines which will be used to ensure these rights are protected.

OLD GROWTH

78 WHAT IS THE DEFINITION OF OLD GROWTH FOREST?

COMMENTS INCLUDED:

“Under this plan, many low-elevation old growth forests . . . would be adversely affected.”

“The old-growth definition task group (1986) presents a preliminary objective definition of old growth.”

“...utterly priceless genetic material.”

“...existing roadless areas and old growth forests be retained intact. Besides the beautiful scenery, valuable wildlife habitat and fish habitat is secure, as well as watershed quality and recreational opportunities.”

“...little chance to experience our pristine, old-growth forest.”

“...old growth ecosystem.”

“...distinguish between old growth timber in a 240 year rotation and `super old growth`.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0035, 0066, 0582, 2720, 2816, 3083, 3127, 3190, 3225, 3239, 3241, 3255, 3287, 3936, 4405, 4477, 4494, 4496, 4498, 4511

FOREST SERVICE RESPONSE:

The public responses to old growth forests showed that many people desire old growth for a variety of reasons (wildlife, recreation, timber, ecosystem, visuals, soil and water quality). The draft EIS defined old growth from a wildlife and timber viewpoint only.

To better address the old growth issue the Forest has recognized the differing definitions of old growth and, by resource, has re-defined old growth in the Affected Environment, Chapter III of the FEIS. Further evaluation of comments, in recognition of the many and varied values of old growth, resulted in a philosophical change of the old growth prescription. The previous prescription used timber harvest to provide wildlife habitat while growing old trees. The new prescription avoids timber harvest and protects old growth for aesthetics, wildlife and plant habitat, and biological diversity.

79 HOW MANY ACRES OF OLD GROWTH WILL BE PROVIDED?

COMMENTS INCLUDED:

“...leave all roadless areas and old growth.”

“...as much old growth as possible.”

“The Forest Service seems intent to continue to wipe out our old growth forest.”

“...old growth habitat is clearly lost, not increased.”

“Old growth timber should not be hoarded to waste, thus losing jobs along with timber.”

FOREST SERVICE RESPONSE:

The Forest's objectives are to:

1. Provide old growth where required for fish and wildlife habitat (CFR 36 219.19) and biological diversity (CFR 36 219. 27 g, 16 U.S.C 1604(g)(3)(b));
2. Provide multiple outputs from old growth where compatible (e.g., wildlife habitat, wilderness, aesthetics and biological diversity may be provided in the same stand); and
3. Allocate some of the remaining old growth to various resources to get the optimum mix of outputs (e.g., timber harvest, scenery, wildlife, recreation, and biological diversity).

The allocation of old growth to multiple use resource provides a mix of benefits to meet the desires of the mix of people who use the Forest.

There are 300,000 to 500,000 acres of old growth on the Forest depending upon what resource definition is used. Old growth allocations are designed to fulfill the needs for biological diversity. Old growth acreage above that required for biological diversity may then be allocated to other resources. There has been some adjustment in the allocation of old growth acres between the draft EIS and the final EIS. Allocation of old growth acres by alternative are listed in Chapter II of the FEIS.

The allocations are based in part on new assessments conducted between the draft EIS and final EIS for spotted owl habitat needs and aesthetics. The acreage figures and the new inventories are estimates based on available information and local knowledge of the Forest.

One of the biggest public concerns was that sufficient old growth habitat be preserved for a variety of reasons. The Forest has summarized these reasons into three previously mentioned categories, namely: wildlife and plant habitat, biological diversity, and aesthetics. A process outlined in Chapter IV of the Plan (Diversity Standards and Guidelines) provides for analysis of each proposed project that affects diversity, habitat, and aesthetics in a sub-drainage. This process allows for change in allocation of areas where sub-drainage diversity, habitat or aesthetics would be unacceptably impacted. In essence this means that even though an area of old growth is not currently included in the OG-1 prescription there is a provision to allow inclusion at a later date, if it is judged that the loss of the area could reduce the old growth in a sub-drainage to unacceptable levels.

80 HOW WILL OLD GROWTH BE MANAGED?

COMMENTS INCLUDED:

“...once cut the old growth is gone forever.”

“...old growth forest is irreplaceable.”

“...overmature trees breed insect tree and earth diseases and create fire hazards.”

“Does not second growth become old growth in 60 to 160 years?”

“What is the probability of replacing current old-growth communities?”

“...old growth should be protected.”

“...old growth forest should be preserved.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0023, 0063, 0067, 0073, 0076, 0085, 0113, 0114, 0115, 0118, 0143, 0144, 0150, 0152, 0179, 0262, 0363, 0377, 0389, 0392, 0393, 0394, 0395, 0396, 0426, 0434, 0483, 0486, 0496, 0508, 0531, 0549, 0555, 0562, 0567, 0569, 0570, 0571, 0572, 0577, 0582, 0590, 0602, 0604, 0610, 0612, 0613, 0624, 0635, 0640, 0641, 0655, 0656, 0661, 0719, 0728, 0740, 0741, 0789, 0826, 0835, 0838, 0841, 0863, 0865, 0866, 0879, 0899, 0994, 1346, 1948, 1949, 1971, 1977, 1991, 1992, 2003, 2007, 2012, 2021, 2026, 2039, 2041, 2053, 2073, 2074, 2087, 2132, 2170, 2176, 2179, 2185, 2207, 2720, 2725, 2728, 2732, 2734, 2763, 2772, 2776, 2798, 2816, 2825, 2833, 2850, 2858, 2864, 2869, 2878, 2887, 2888, 2891, 2892, 2900, 2901, 2907, 2911, 2912, 2913, 2932, 2934, 2936, 2939, 2941, 2947, 2954, 2955, 2956, 2958, 2959, 2963, 2966, 2967, 2983, 2989, 2993, 2994, 2995, 2996, 2998, 2999, 3017, 3027, 3029, 3033, 3045, 3047, 3065, 3077, 3078, 3080, 3088, 3103, 3109, 3115, 3118, 3119, 3126, 3127, 3129, 3131, 3134, 3152, 3162, 3164, 3171, 3173, 3177, 3182, 3184, 3190, 3194, 3203, 3208, 3212, 3214, 3219, 3226, 3230, 3232, 3233, 3234, 3237, 3239, 3241, 3252, 3255, 3278, 3287, 3303, 3307, 3319, 3323, 3325, 3328, 3330, 3333, 3341, 3348, 3354, 3366, 3370, 3377, 3384, 3397, 3409, 3410, 3465, 3467, 3470, 3471, 3505, 3520, 3521, 3529, 3559, 3561, 3562, 3572, 3576, 3579, 3592, 3603, 3606, 3610, 3616, 3617, 3621, 3628, 3630, 3648, 3667, 3678, 3710, 3715, 3717, 3719, 3724, 3725, 3726, 3742, 3754, 3765, 3766, 3767, 3769, 3795, 3797, 3807, 3809, 3811, 3814, 3823, 3824, 3833, 3849, 3862, 3871, 3873, 3875, 3883, 3911, 3913, 3926, 3936, 3938, 3995, 4004, 4019, 4027, 4039, 4042, 4061, 4065, 4071, 4078, 4079, 4082, 4088, 4090, 4094, 4110, 4126, 4139, 4145, 4162, 4172, 4203, 4217, 4231, 4241, 4261, 4263, 4277, 4307, 4309, 4415, 4423, 4432, 4433, 4440, 4452, 4453, 4457, 4467, 4471, 4474, 4477, 4485, 4488, 4490, 4493, 4494, 4496, 4498, 4501, 4510, 4511, 9011, 9012, 9018, 9022, 9041, 9045, 9051, 9065, 9069, 9074, 9078, 9081, 9087, 9106, 9111

FOREST SERVICE RESPONSE:

In the draft EIS old growth outside wilderness and roadless areas was scheduled for management under a prescription that would have managed timber to create old growth conditions. The objective of this prescription was to meet wildlife and timber output needs.

In response to public concerns a more conservative management view was adopted. The old growth management prescription in the FEIS was changed to recognize the inherent values of old growth and to provide for wildlife and plant habitat, aesthetics, and biological diversity. No timber harvest is planned. Additional acres of old growth have been allocated to this prescription for aesthetic and ecosystem diversity. At the same time, some acreage has been removed from this prescription and reallocated to a wildlife prescription that provides mature wildlife habitat through timber harvest.

81 HOW CAN THE ACRES OF OLD GROWTH BE INCREASING AS TIMBER IS HARVESTED?

COMMENTS INCLUDED:

“By building more roads and cutting trees on more acres, old growth will actually increase.”

“With the intention to cut over 30 square miles of old growth the draft EIS somehow manages to conclude that the total amount of old growth and therefore, the populations of some 150 species of wildlife which use these stands will increase over the same period of time.”

0748, 0866, 1977, 2833, 2863, 2934, 3083, 3085, 3164, 3190, 3225, 3287, 3606, 3648, 3860, 3872, 4005, 4061, 4415, 4477, 4490, 4492, 4493, 4494, 4498, 4511, 9065

FOREST SERVICE RESPONSE:

This is largely a matter of definition. In the Draft EIS, any forest stand over 200 years old was considered to be old growth. Though the preferred alternative showed harvesting of old growth, there were more acres of mature forest (stands 150-190 years old) which would qualify as old growth over time than there was old growth scheduled for harvest.

Some acres of visual or other resources were included in this definition because they met Forest Service's Pacific Northwest Region definition of being 200 years or older, and having 15 trees per acre over 20" in diameter. These acres will support harvest by some method of partial removal of timber but after harvesting continue to meet the definition and are counted as old growth.

Because of the concern by the public and internal management concerns, the method of estimating old growth acres has been changed. In the Draft EIS any stand that was 200 or more years old was considered old growth. Currently only stands that display attributes reflective of the natural functioning of the old growth ecosystem are considered old growth. Many stands allocated for scenic or aesthetic purposes may not meet this definition because the required standing dead trees and downed logs may not be present. These stands are not counted as old growth in the FEIS.

Stands that were automatically included as old growth in the draft because they were over 200 years old were closely reviewed and only those with the essential structural characteristics of old growth are included in the inventory. This changed the acres of old growth and shows the amount of old growth decreasing over time.

82 OLD GROWTH HABITAT IS NOT WELL DISTRIBUTED THROUGHOUT THE ROADED PART OF THE FOREST.

COMMENTS INCLUDED:

“...fact that...Forest does not have the distribution of large old growth stands in the roaded portion...to meet the minimum management for old growth species...is no reason to justify finishing off the small islands...”

“The old-growth stands are inadequate to support old-growth adapted species.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0582, 0605, 0656, 0812, 2956, 2994, 3065, 3083, 3134, 3177, 3185, 3225, 3509, 3742, 3899, 3911, 4005, 4139, 4241

FOREST SERVICE RESPONSE:

CFR 36 219.19 provides that “Fish and wildlife habitat shall be managed to maintain viable populations of existing native and desired non-native vertebrate species in the planning area. For planning purposes, a viable population shall be regarded as one which has the estimated numbers and distribution of reproductive individuals to insure its continued existence and is well distributed in the planning area.”

The habitat discussion in Chapter III of the draft EIS states that the mature and old growth habitat network is not distributed throughout the roaded portion of the Forest (indicator species for this network include spotted owl, pileated woodpecker, marten and northern three-toed woodpecker). The east edge of the Forest ranges from grand fir to ponderosa pine to sagebrush habitat. In this transition area from forest to non-forest, forested habitat becomes discontinuous and suitable forested habitat is found in stringers. Some of these stringers have been subjected to wildfire and timber harvest and old growth habitat is not found in these areas at this time.

The Regional Management Requirements changed in June 1986 from a grid-like distribution of habitat to an area distribution. The new network includes more islands of mature or old growth habitat than the previous system and is more reactive to existing conditions and actual wildlife distribution. The Wenatchee National Forest changed to this new system between the draft and the final EIS.

In addition to setting areas aside for wildlife habitat, the prescription for old growth allows areas to be set aside for aesthetics and biological diversity. The value of small islands of old growth will be determined in site-specific environmental analysis before the decision is made on whether or how to proceed with a project.

There are areas which do not have mature or old growth habitat that is capable of providing habitat in the future. The areas where capable habitat has not been identified are large (4500 acres or larger).

During the time period (10-15 years) covered by the FEIS, trees in areas capable of producing old growth will be growing older. Even if activities (including timber harvest) do take place there is a low likelihood that all aging stands in the planning area will be disturbed before the next Forest Plan is completed. The next Forest Plan will then have the opportunity to expand the network using older habitat and increased knowledge of the needs of the mature/old growth network.

WILDLIFE

83 PROVISIONS ARE NOT MADE TO MEET THE “MIGRATORY BIRD TREATY ACT”.

COMMENTS INCLUDED:

“A thorough discussion should be included as to how the FS plans to prevent the destruction, and enhance the habitat, of birds, nests and eggs protected under the Migratory Bird Treaty Act.”

“...no provisions for protection of raptor nests.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

2132, 3202, 9094

FOREST SERVICE RESPONSE:

In recognition of the omission of the “Migratory Bird Treaty Act,” a Forest-wide Standard and Guideline requiring protection of all raptor nests (Chapter IV of Plan in Forest-wide Standards and Guidelines) has been included.

Specific treatments will be developed for each species on a site-by-site basis.

84 THE INDICATOR SPECIES SYSTEM.

COMMENTS INCLUDED:

“We find that the indicator species system seems to have some inherent problems.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0151, 0582, 2132, 2892, 3255, 4485, 4498

FOREST SERVICE RESPONSE:

The National Forest Management Act regulations CFR 219.19 (a) provides that each alternative shall establish objectives for maintenance and improvement of habitat for management indicator species (MIS). Though the MIS system may have inherent problems, it is the direction provided for Forest planning. As new information systems are developed, the Forest will shift accordingly.

85 WHAT IS THE MANAGEMENT FOR GRIZZLY BEAR AND GRAY WOLF?

COMMENTS INCLUDED:

“These species should also be used as indicators, and recovery plans discussed in your documents.”

“The DEIS fails to address the past, present and future of wild gray wolf.”

“The discussion of threatened and endangered (T&E) species should include the grizzly bear.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0062, 0582, 0736, 3236, 3552, 3743, 3911, 4475, 4511, 9086

FOREST SERVICE RESPONSE:

The Forest Service is required to provide habitat for recovery of all threatened or endangered species under the Endangered Species Act. This usually occurs through the cooperatively developed (with U.S. Fish and Wildlife Service) recovery plans for a listed species.

In the case of the grizzly bear, the Wenatchee is participating with the U.S. Fish and Wildlife Service, Washington Department of Wildlife, the North Cascades National Park, National Park Service, Mt. Baker National Forest, and Okanogan National Forest in a cooperative grizzly bear habitat and population study. When the study is complete it will be decided whether a recovery area shall be established. In the interim, the Forest will follow Standard and Guidelines for the grizzly bear which have now been added to the Forest Plan. These include cooperation with the U. S. Fish and Wildlife Service and the Washington Department of Wildlife in assessing project impacts and developing mitigation measures. The Forest will also be consulting with U.S. Fish and Wildlife Service when biological evaluations indicate a project "may affect" grizzly bears or their habitat.

Under the Endangered Species Act, the U.S. Fish and Wildlife Service has the lead responsibility for recovery plans. Currently there is no recovery plan for the gray wolf. Until one is developed for the gray wolf, the Forest will operate on the basis of the new Forest Plan Standards and Guidelines.

If the status of either of these species should be changed during the life of the EIS, then the Forest Service will do a supplement or addendum to show the changes in management and effects mandated in the recovery plans for these two species and the effects of these changes.

86 HOW WILL PRIMARY CAVITY EXCAVATOR HABITAT BE MANAGED?

COMMENTS INCLUDED:

"...snags should be left in place to serve as nesting areas."

"...needs a more definitive, effective snag policy."

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0582, 2847, 3065, 3083, 3190, 3256, 3345, 3572, 3678, 3879, 4477, 4485, 4494, 9065

FOREST SERVICE RESPONSE:

We agree. In response to public comment and internal review, extensive revision was done to strengthen the snag policy. Our goal is to provide long-term dead and defective habitat for wildlife needs. See Chapter IV of the Plan for Standards and Guidelines relating to this topic.

87 MANAGEMENT AND ASSESSMENT OF SPOTTED OWLS.

COMMENTS INCLUDED:

"What assumptions were used in determining spotted owl populations will increase over the next 45 years?"

“Our research indicates the average amount of old growth used by owls in Washington is 4500 acres.”

“There is no positive finding that the owl needs old growth.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0021, 0025, 0040, 0063, 0065, 0069, 0110, 0128, 0144, 0146, 0152, 0154, 0171, 0172, 0179, 0194, 0206, 0207, 0216, 0227, 0243, 0263, 0265, 0280, 0289, 0301, 0339, 0357, 0360, 0372, 0374, 0400, 0409, 0411, 0434, 0509, 0527, 0543, 0544, 0567, 0568, 0569, 0582, 0602, 0666, 0678, 0747, 0760, 0774, 0810, 0844, 0900, 1003, 1087, 1137, 1247, 1248, 1255, 1261, 1270, 1272, 1278, 1282, 1316, 1322, 1325, 1411, 1416, 1425, 1490, 1516, 1541, 1572, 1574, 1590, 1591, 1638, 1650, 1651, 1809, 1813, 1815, 1817, 1824, 1843, 1878, 1887, 1903, 1952, 2002, 2003, 2054, 2134, 2141, 2250, 2253, 2283, 2286, 2289, 2452, 2459, 2546, 2590, 2601, 2653, 2711, 2716, 2732, 2749, 2759, 2772, 2815, 2819, 2853, 2858, 2868, 2878, 2879, 2888, 2889, 2908, 2969, 2996, 3083, 3139, 3158, 3180, 3185, 3190, 3194, 3202, 3254, 3274, 3309, 3335, 3487, 3520, 3546, 3580, 3596, 3601, 3602, 3610, 3652, 3680, 3724, 3742, 3775, 3776, 3778, 3804, 3857, 3870, 3876, 3911, 4019, 4083, 4098, 4110, 4235, 4239, 4296, 4300, 4328, 4343, 4379, 4431, 4457, 4463, 4467, 4471, 4489, 4490, 4493, 4496, 4498, 4503, 4534, 9002, 9029, 9044, 9055, 9060, 9069, 9092, 9094, 9101, 9102, 9103, 9106, 9111

FOREST SERVICE RESPONSE:

The Forest Service has completed the “Final Supplement to the Environmental Impact Statement for an Amendment to the Pacific Northwest Regional Guide” for spotted owls. This document has been approved and provides direction on distribution, size of area per site, and definition of spotted owl habitat. For the Wenatchee National Forest the selected acreage per spotted owl habitat area is 2,200 acres.

The Final Supplement’s definition of spotted owl habitat is broad enough to fit the habitat used by spotted owls on the Wenatchee National Forest. Spotted owls do require a set of structural forest characteristics that include old growth trees.

In the draft EIS the number of acres with old growth trees increased over time. As a result the habitat for spotted owls increased and accordingly the number of spotted owls. Since the draft the Forest has inventoried spotted owls, inventoried spotted owl habitat, and redefined habitat for spotted owls. From this new information it is estimated the number of spotted owl sites will decrease from about 140-150 now to 116 in 15 years.

In the draft EIS the Forest Service proposed to manage spotted owl habitat on a 260 year rotation timber harvest-old growth habitat prescription. The Forest has changed that to a prescription which provides spotted owl habitat with no timber harvest. It is believed that more research is needed to show how timber harvest can be done economically and still provide habitat for spotted owls and other species. Several important spotted owl research studies already are under way on the Wenatchee National Forest to help answer such questions.

88 HOW WILL RIPARIAN (STREAMSIDE ZONES) BE MANAGED FOR WILDLIFE?

COMMENTS INCLUDED:

“We believe that 15-20 trees per acre would not be sufficient to provide optimum wildlife habitat.”

“...timber management in big game and riparian areas is fairly loosely defined.”

“The only species who would benefit from this improvement would be the two legged animal carrying a chainsaw.”

“I don't know anyone who claims enough knowledge to improve upon it.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0392, 0496, 0582, 2879, 3509, 3550, 3833, 4298, 4485, 4489, 4490, 4494, 4495, 4510, 9094

FOREST SERVICE RESPONSE:

Because of the public comments received, the riparian prescription has been restructured to be more definitive and responsive to the primary purposes of providing fish and wildlife habitat (see prescription in Chapter IV of the Plan).

The new riparian prescription provides for emphasis on fish and wildlife habitat while allowing some timber harvest. The prescription has been expanded to provide riparian habitat along streams that do not have water in them all year. This expansion provides protection of fish values downstream and wildlife values (amphibian habitat) in the immediate vicinity.

Most wildlife values appear to be covered by standards and guidelines for water quality and fish habitat but some standards are designed to provide wildlife habitat.

Application of constraints to benefit wildlife in riparian habitat is new to this Forest. Close monitoring will be needed to see if the diversity of habitat and deciduous tree components are maintained for wildlife.

89 PRODUCTION POTENTIAL FOR WILDLIFE WAS NOT SHOWN IN THE DRAFT PLAN.

COMMENTS INCLUDED:

“Display production potential for all indicator species”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0582, 3553, 9041

FOREST SERVICE RESPONSE:

Chapter II of the Plan is where production potentials are displayed. Production potential establishes the upper end of the production curve and the management requirements for minimum viable populations of wildlife species establish the lower end of the curve. Without these two points on the production curve, it is difficult to understand the relationship of wildlife populations to the outputs for a alternative or trade-offs in comparison to other alternatives.

In the draft, no production potentials for wildlife were displayed due to the lack of information and lack of experience in developing them for wildlife. In the final, they have been estimated using recently gathered information, professional judgement and experience. As more research and information is available predictions will be refined.

90 HOW SHOULD OFF-ROAD VEHICLES AND WILDLIFE BE MANAGED:

COMMENTS INCLUDED:

“ORV’s should be permitted in these areas only when its determined there will be no conflict with wildlife.”

“No new ORV development should occur.”

“Wildlife habitat values cause some areas to be inappropriate for ORV development and uses.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0582, 0900, 2132, 4494

FOREST SERVICE RESPONSE:

We will work closely with the Washington Department of Wildlife to identify wildlife areas such as deer fawning and elk calving areas or wildlife winter range where use restrictions may be needed. We believe such restrictions usually can be seasonal in nature. We intend to monitor ORV use annually over the life of the Plan to ensure unacceptable impacts are not occurring on wildlife or other forest resources.

91 HOW WILL ROADS BE MANAGED TO PROVIDE WILDLIFE HABITAT?

COMMENTS INCLUDED:

“One of the most glaring omissions in the plan’s wildlife analysis was ignoring the impacts of new roads in currently undisturbed wildlife habitat.”

“We recommend that you minimize new road mileage.”

“The Forest-wide Standards and Guidelines for road development and management do not adequately recognize and protect wildlife values.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0009, 0062, 0066, 0363, 0377, 0389, 0409, 0582, 0900, 1954, 2132, 2725, 2752, 2782, 2794, 2831, 2869, 2913, 2963, 2968, 2994, 3009, 3016, 3032, 3065, 3157, 3177, 3209, 3225, 3234, 3250, 3255, 3287, 3320, 3368, 3388, 3397, 3422, 3520, 3731, 3868, 3936, 4005, 4263, 4296, 4298, 4475, 4477, 4490, 4494, 4498, 9041, 9065, 9094

FOREST SERVICE RESPONSE:

In response to the public comments, the road closure statement in the Forest-wide Standards and Guidelines has been changed. All new roads constructed will be closed unless the project analysis documents the need for continued public motor vehicle access. Unless there is a resource reason to close existing roads they will remain open to the public. The implementation of these Standards and Guidelines are expected to result in about the same amount of public access by automobile as is currently available. Timber sale roads will remain open for firewood removal as appropriate. Nothing in this policy is intended to abridge the access rights of miners that are provided for under law.

92 STANDARDS AND GUIDELINES FOR WILDLIFE HAVE MODIFIERS WHICH SEEM INCONSISTENT WITH OTHER RESOURCES.

COMMENTS INCLUDED:

“We question whether modifiers such as ‘strive for’, ‘consider’ and ‘where possible’ are appropriate for standards. It should be noted that this language only appears in the wildlife sections.”

“...standards and guidelines relative to wildlife habitat protection are very weak.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0582, 0656, 2201, 2879, 3083, 3731, 4005, 4485, 9065

FOREST SERVICE RESPONSE:

Modifiers are used throughout the Plan to better describe the management desired and the information available. Modifiers are used in describing most resource areas and are not unique to wildlife.

93 WHAT MODELS SHOULD THE FOREST USE TO PREDICT THE HABITAT SUITABILITY INDEX?

COMMENTS INCLUDED:

“The Forest Service (FS) should consider the use of two methodologies developed by the Fish and Wildlife Service (FWS): Habitat Evaluation Procedures (HEP).”

“The DEIS does not describe the procedures the planning team used to calculate either habitat effectiveness values.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

582, 4490, 9094

FOREST SERVICE RESPONSE:

The Forest Service has models that will estimate the number of animals a given area may produce. Though these models have deficiencies, they do provide a relative measure of trade-offs. In some cases we lack valid data to calibrate a model for some species. In those situations outputs for wildlife are done by professional judgement and the procedures to do the predicting vary by species.

The HEP wildlife models have been reviewed and we find they cannot be used because:

1. The Forest does not have information in the formats needed to run the model.
2. One of the outputs needed in Forest planning to evaluate trade-offs is the number of animals. The HEP model does not predict numbers of animals.

Though we have not made total application of the HEP Model we have used the information on habitat characteristics. The U.S. Fish and Wildlife Service has done a good job of identifying the characteristics that effect the species.

94 MANAGEMENT AND ASSESSMENT OF MARTEN AND PILEATED WOODPECKER AREAS.

COMMENTS INCLUDED:

“It seems unreasonable that as many acres are being allocated separately to martin/pileated (?) habitat areas as there are to spotted owls?”

“Could its habitat be managed to cause less impact on timber supply?”

“Pages II-108, Table II-32, marten. The figures given here match those for pileated woodpecker.”

“We strongly suspect the population projections for these species are just as inaccurate as the Wenatchee National Forest population projections for spotted owl.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0047, 0128, 0582, 0602, 0666, 0900, 1411, 2716, 2847, 2868, 2878, 3065, 3190, 3202, 3335, 3487, 3520, 3775, 3876, 4019, 4110, 4489, 4493

FOREST SERVICE RESPONSE:

The marten and pileated woodpecker are indicator species with Regional Management Requirements. These species were selected to provide mature and old growth habitat for all other species needing this habitat.

Using the habitat requirements for each indicator species a network for each species was built. In developing this network maximum overlap of habitat areas for indicator species with similar habitat needs was sought in order to reduce the effects on timber supply to a minimum.

The fact that there are more acres allocated to marten and pileated woodpeckers than to spotted owls is a function of site dispersal requirements. Marten and pileated woodpecker sites are much closer together than are spotted owl sites. (more sites result from shorter distances between sites). Between the draft and final, spotted owl habitat acres have increased and more flexibility has been exercised in distribution and location of marten and pileated woodpecker habitat. The relationship of acres allocated to spotted owls versus marten and pileated woodpeckers is one of species habitat requirements and not an indication of species importance.

The draft Forest Plan allowed timber management within marten and pileated woodpecker sites on a 260 year rotation (old growth habitat prescription). Established research shows marten and pileated woodpeckers use either mature or old growth habitat. Therefore the Forest has the choice of managing for old growth or mature habitat for these species. In the final the Forest has chosen to provide a mature habitat prescription based on a 180 year rotation to produce a greater flow of wood products while still meeting the wildlife needs.

It is true the marten and pileated woodpecker outputs were the same and estimated to be increasing over time in the DEIS. In the FEIS the two outputs are different and the trend for these species population is downward.

The Forest Service has provided for a viable population of these wildlife species and met the distribution requirements in alternatives where Management Requirements are included.

95 WHY HAVE INSECTS NOT BEEN ADDRESSED IN THE FOREST PLAN?

COMMENTS INCLUDED:

“Other species such as insects can have a significant impact on Forest Resources”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0579, 2201, 3083, 9018

FOREST SERVICE RESPONSE:

Insects have a significant effect on the management of a forest. Insects influence the populations of animals and how fast trees grow. Insects have been addressed in a number of places in this Forest Plan.

1. Lists of threatened, endangered and sensitive (T,E&S) insects were reviewed and it is believed none of those listed exist on the Forest. If there were the Forest would address them as it has threatened, endangered and sensitive plants and animals through consultation with US Fish and Wildlife Service.
2. Most prescriptions have standards and guidelines giving direction on what is to be done if disease or insects populations reach unacceptable levels (see Chapter IV, Management Prescriptions, of the Forest Plan).
3. Insects are important food for many species of birds, amphibians, reptiles and mammals. Therefore some discussion and consideration have been given to insects using these species as indicators for wildlife, plants, insects or organisms (FEIS, Chapter III, Wildlife subsection Primary Cavity Excavators).

Insects may have an even more important role in the forest than has been portrayed but more specific research is needed to better understand the relationship of insect communities to the forest ecosystem before additional management direction can be developed.

96 DIRECT, INDIRECT, AND CUMULATIVE EFFECTS FOR WILDLIFE HAVE INADEQUATE ASSESSMENTS AND MANAGEMENT DIRECTION.

COMMENTS INCLUDED:

“...cumulative impacts fail to meet NEPA requirements.”

“Have cumulative effects of more roads and recreation been included in big game output models.”

“The DEIS is very deficient in its consideration of wildlife.”

“...impacts are not discussed.”

“The impacts of the plan on many important species is completely ignored.”

“...entry understates adverse effects.”

“...someone’s best estimate rather than site specific research.”

“...your wildlife data base is very incomplete.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0063, 0066, 0067, 0092, 0114, 0124, 0147, 0262, 0292, 0307, 0342, 0363, 0392, 0441, 0502, 0519, 0522, 0528, 0561, 0562, 0577, 0579, 0582, 0597, 0603, 0604, 0618, 0646, 0655, 0656, 0660, 0730, 0882, 0896, 0898, 0900, 1302, 1937, 1947, 1970, 1991, 2131, 2132, 2205, 2453, 2719, 2725, 2732, 2763, 2776, 2782, 2791, 2831, 2846, 2849, 2854, 2863, 2871, 2873, 2878, 2879, 2901, 2911, 2934, 2940, 2941, 2956, 2969, 2994, 2998, 3009, 3016, 3027, 3029, 3032, 3065, 3067, 3077, 3083, 3085, 3099, 3126, 3150, 3157, 3170, 3177, 3186, 3190, 3198, 3209, 3211, 3219, 3225, 3228, 3231, 3234, 3239, 3255, 3256, 3259, 3287, 3320, 3352, 3363, 3388, 3392, 3394, 3397, 3422, 3487, 3520, 3539, 3552, 3553, 3566, 3571, 3576, 3606, 3621, 3645, 3693, 3727, 3731, 3788, 3791, 3795, 3817, 3833, 3849, 3863, 3872, 3899, 3933, 3938, 3954, 3989, 4019, 4069, 4123, 4204, 4210, 4222, 4236, 4239, 4269, 4270, 4298, 4310, 4405, 4423, 4454, 4471, 4477, 4485, 4488, 4489, 4490, 4492, 4494, 4498, 4501, 4508, 4510, 4511, 9014, 9030, 9041, 9065, 9094

FOREST SERVICE RESPONSE:

The best and most consistent way to assess the direct, indirect and cumulative effects of projects or potential changes in management direction is to use models. However, the basic vegetation information used in Forest planning is not adequately categorized to provide habitat information by habitat groups for wildlife. The Forest is currently working to develop a multi-resource inventory which will replace the present inventory. Concurrently we are developing a Geographic Information System (GIS) to store and manipulate the new inventory. When the inventory and GIS system are in operation the information needed to use models and make better estimates of effects will be available.

In the meantime the Forest plan must be completed with the best information available. In this case the best estimates of effects and outputs are done using professional judgement, past experiences, knowledge of the Forest's habitat(s), understanding the planning process, and theories of wildlife management. Between the Draft and Final, there have been many changes in the assessment of direct, indirect and cumulative effects of other projects on wildlife.

In addition, we have been emphasizing Wenatchee National Forest wildlife by gathering information and designing prescriptions that are more conservative, and reviewing mapping of allocations with more detail since the draft Forest Plan was sent out for review. This additional work has added significantly to the treatment of wildlife in the Final.

For example, we have completed 3 years of surveys on spotted owls, mapped spotted owl habitat and gathered information on grizzly bear habitat.

Two examples of more conservative prescriptions are: The old growth prescription (for spotted owls) does not allow timber harvesting now and the mature forest prescription (for marten and pileated woodpeckers) will have little if any harvesting in the core area for these species during the next 10 years.

Examples of solving problems by more detailed mapping are:

As the Forest developed the mature and old growth habitat network, individual habitat areas were located so as to compensate for losses of habitat on adjacent land ownerships effects. This was done for spotted owls by providing additional sites and/or acres near major weak points in the network created by checkerboard ownership patterns. Marten, northern three-toed woodpeckers and pileated woodpecker sites were also strategically located to meet distribution requirements across checkerboard ownerships. This process compensates for the cumulative effects of private land management on the wildlife species.

As time goes on, the Forest Service will continue to gather information and develop models to help assess the impacts of projects on wildlife. If the new information and modeling show significant problems that need resolution, an amendment to the Forest Plan may be made.

97 THE MANAGEMENT DIRECTION FOR BIG GAME.

COMMENTS INCLUDED:

“...separate prescriptions considered for transitional and summer range.”

“Its this winter range, not your total forage, that is the limiting factor for deer and elk.”

“Road management would far outweigh the effects of 1300 acre-equivalents per year of habitat improvements.”

“...general prescription is written to cover multiple species and seasons. We recommend you develop separate sections.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0005, 0062, 0116, 0307, 0386, 0577, 0582, 0586, 0619, 0791, 0794, 0900, 1954, 1955, 2120, 2123, 2131, 2132, 2137, 2732, 2749, 2753, 2763, 2776, 2777, 2780, 2782, 2796, 2800, 2824, 2869, 2871, 2878, 2879, 2907, 2913, 3068, 3099, 3203, 3228, 3255, 3341, 3363, 3394, 3410, 3529, 3551, 3592, 3742, 3776, 3804,

3865, 3866, 3867, 3871, 3873, 3879, 3911, 3926, 3936, 4036, 4142, 4194, 4214, 4239, 4243, 4263, 4270, 4298, 4405, 4434, 4435, 4457, 4467, 4474, 4477, 4484, 4485, 4486, 4489, 4490, 4494, 4498, 4502, 4503, 4510, 4511, 9000, 9041, 9046, 9064, 9065, 9094

FOREST SERVICE RESPONSE:

In the draft Forest Plan, mountain goat, mule deer and Rocky Mountain elk were all managed under one prescription. After reviewing public comments and the concerns of forest managers, mountain goat requirements were separated from the big game prescription.

The prescription for management of big game has changed from a 260 year timber rotation to one of 130 year timber rotation which allows greater timber yield without altering the emphasis on meeting deer and elk habitat requirements.

To adequately show the big game picture the outputs for both summer and winter habitat are provided. The number of animals carried in winter is much less than that carried in summer on the Wenatchee Forest.

The management prescription for deer and elk applies to winter range because it is the critical factor. Between the draft and final, Standards and Guidelines were added for managing transitional range and summer range to keep these areas from being a limiting factor (see Chapter IV of the Forest Plan).

All activities, including roads, are limited in the prescription for winter range (both in the draft and final EIS). Therefore, as winter ranges become managed under this prescription, road-related effects will be limited. On the rest of the Forest, all new roads will be closed and old roads will be closed when there are compelling resource needs (closures for deer and elk could be the reason). The road closure standard has been added from the draft to the final to address public concerns over roading.

98 DISAGREE WITH ESTIMATES OF BIG GAME NUMBERS.

COMMENTS INCLUDED:

“Please explain model relationships which show potential increases of about 40% from a habitat potential over 6 times that of current program acreage.”

“We disagree that long-term, high-intensity timber production would improve big game cover/forage relationships.”

“Big Game Estimates. Figures for 1986 seem to show that the current program is producing at maximum potential. Is this so?”

“We believe that more realistic estimates would be 29,000 deer and 14,500 elk, with harvest of 3450 and 4500 respectively.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0582, 3394, 4450, 4489, 4494, 9065

FOREST SERVICE RESPONSE:

There is a large amount of forage available in summer habitat for big game on the Forest. However, forage cannot be the only factor considered because it is not the only habitat requirement. For example, cover becomes the limiting factor at some point and forage abundance then has little value. This information also does not show that the winter range limits the number of animals actually using the Forest.

At present we do not have a population model developed that uses all the factors to calculate big game numbers and our ForPlan computer model does not predict wildlife numbers. Therefore, the model referred to in the Draft is misleading and was not used to calculate numbers for the Final EIS.

Timber harvest can increase habitat for big game until a 40% cover and 60% forage condition exists, then habitat decreases. Some Management Prescriptions in the Forest Plan do not constrain areas planned for timber harvest to provide optimum big game habitat. Therefore, timber harvest will increase habitat sometimes but may decrease it at other times. However, project level planning will offset some of the potential losses in areas allocated to the General Forest Prescription.

Big game estimates in the draft were reviewed and found to be erroneous and were changed accordingly in the final Forest Plan and EIS.

Deer, elk and other wildlife outputs have been recalculated in coordination with the Washington Department of Wildlife. The revised figures reflect that coordination. In Chapter III of the FEIS and Chapter II of the Forest Plan the winter and summer estimates for deer and elk are displayed to better represent expected deer and elk populations.

99 DOES THE FOREST MEET OR EXCEED THE MANAGEMENT REQUIREMENTS FOR WILDLIFE?

COMMENTS INCLUDED:

“Do any alternatives exceed the minimums?”

“The Forest’s interpretation of the regulations is so extreme that it redefines the terms and contradicts direction from the Department of Agriculture.”

“...their [regional management requirements] adoption without consideration of alternatives violates NEPA.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0062, 0409, 0582, 0602, 2123, 2134, 2137, 2716, 2879, 3083, 3180, 3352, 3410, 3539, 3553, 3833, 3849, 4296, 4484, 4489, 4490, 4494, 4498, 9094

FOREST SERVICE RESPONSE:

The species with Regional Management Requirements for this Forest are: Northern Spotted Owl, Pileated Woodpecker, Marten, Northern Three-toed Woodpecker, Primary Cavity Excavators, Riparian (Beaver, Ruffed Grouse), Bald Eagle, Peregrine Falcon, and Grizzly Bear. The Management Requirements were applied as Regional direction directed except in the case of the bald eagle. The bald eagle

was allocated one nest site in the draft. However, the Fish and Wildlife Service's draft recovery plan for this species indicates the Forest should provide eight. This oversight has been corrected in the final EIS.

Since the draft EIS the Forest has received public comments, new Management Requirements from the Region, and new information on many species' needs. As a result of this information, there have been many changes in the management of species that have Management Requirements.

The Forest Services' "Final Supplement" for the spotted owl in the Pacific Northwest Region has been completed and new direction is provided for management of this habitat. In response, the preferred alternative for the Wenatchee Forest Plan has been changed to include 66 spotted owl habitat areas. The draft included 79 potential sites to provide the flexibility for meeting the Regional network requirements when that direction became known. Spotted owl management has changed from a 260 year old growth prescription that permitted timber harvest to a prescription that protects the spotted owl habitat without timber harvest.

Marten/Northern Three-toed Woodpecker habitat areas were relocated using new Regional direction. The prescription for these species in the draft Plan included a 260-year old growth timber harvest prescription. This has been changed to a 180 year mature habitat timber harvest prescription which is thought to fully meet habitat needs of the species while producing increased timber volumes over time.

New Regional direction has been developed to describe primary cavity excavator habitat. As a result some new standards and guidelines have been developed by the Forest. The new direction has been calculated to have a 2% reduction in potential timber harvest forest-wide.

The riparian prescription for the indicator species beaver and ruffed grouse has been rewritten to better define the management requirements for all activities.

Peregrine falcon habitat has been partially identified and Forest-Wide standards and guidelines added.

Grizzly bear management has been better defined by Forest-wide standards and guidelines.

The changes in management direction for species with Regional Management Requirements still meet or exceed the Regional direction.

Management Requirements for indicator species have been applied to alternatives. The amount of habitat above minimum levels for this group of species changed in response to changing allocations and the differing emphasis of the various alternatives.

FISH

100 SEVERAL RESPONDENTS QUESTION HOW FISH OUTPUTS WERE DISPLAYED AND THE ASSUMPTIONS USED TO DETERMINE THE OUTPUTS.

COMMENTS INCLUDED:

“The conversion of actual fishing trips to recreation visitor days means that the values in Table B-IV-2 (page B-82 of the Appendices) are unrealistically low. At these levels, the values would fall far below any of the contemporary economic valuations for Pacific Salmon benefits in the Pacific Northwest.”

“Page II-156, Economic Values: The economic indicator for anadromous fish is described as ‘commercial harvest of anadromous fish.’ While commercial harvest is an important contributor to the national economy, other values can be assigned for recreational fishing. For some species of anadromous fish this sport harvest is a major factor in their dollar value and may increase in the future.”

“Page III-47, Paragraph 5: The June 1982 NOAA Technical Memorandum, NMFS, F/NWR3, Net Economic Values for Salmon and Steelhead from the Columbia River System is cited as the source for harvest distribution data for anadromous fish spawned on the Forest. This report is now outdated.”

“Page III-26, Table IV-1. It would help a great deal to show fish and wildlife models and parameters, so that we could see how numbers in this table are derived, and comment on the assumptions you use.”

“Why is smolt habitat capability assumed to require full escapement on the Forest (Plan II-24)? Assuming conditions in the habitat are not widely fluctuating then its capability will remain unchanged regardless of escapement level. The number of smolts produced may change with parent escapements but the habitat’s ability to sustain them is a variable independent of fish numbers.”

“The Forest’s estimated commercial and sport harvest potential (Plan II-24) is misleading: What mortality rate is referred to when it is assumed that “off-forest dam losses are nearly eliminated?”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0010, 0579, 0716, 3065, 3225, 3270, 3464, 3550, 3911, 4035, 4485, 4493, 4495, 4498

FOREST SERVICE RESPONSE:

All fish outputs were reviewed between the DEIS and FEIS. For background information on calculations and assumptions the reader is referred to Documentation for Formulation of Fisheries Outputs for Wenatchee Forest Plan, Second Edition by Ken MacDonald. The revised fish output estimates are reflected in Chapter III of the FEIS. These outputs include pounds of commercial fish, fish user days, smolt habitat capability and estimates of escapements of management indicator species including spring and summer chinook salmon, sockeye salmon and summer steelhead trout. In addition, projected numbers of adult cutthroat trout are shown. The only management indicator species for which there are no

projections are bull trout because there is not enough information to make the estimates. The Forest will be conducting a project in fiscal year 1989 to describe bull trout distribution and abundance.

Actual numbers of returning adult anadromous fish will be dependant upon a number of factors, including survival at mainstream Columbia River Dams, ocean and river harvest, passage improvements in streams below the National Forest boundary, as well as habitat quality on the National Forest. Due to these factors, the Forest's monitoring plan calls for monitoring smolt habitat capability as well as returning adults, in cooperation with State, Federal and Tribal fish management agencies.

The Forest Service agrees that the number of smolts produced in any year may vary due to a variety of factors. Smolt habitat capability reflects habitat condition and it is a goal of the plan that habitat capability improve over time. Anadromous fish outputs assume full seeding by the second decade in an attempt to reflect the value of the habitat and to allow comparison between alternatives. It should be emphasized that these numbers are estimates used to compare alternatives. The numbers will need to be revised as new information becomes available.

Dollar values for anadromous fish in the FEIS include not only commercial harvest, but also recreational harvest off-Forest. Values of commercial and sport fish harvest are those values used for RPA 1985 as per Forest Service direction.

101 IT APPEARS THAT THE FOREST FISHERIES PROGRAM IS TIED TO THE AMOUNT OF TIMBER HARVESTED. WILL KV FUNDS BE AVAILABLE TO USE WHEN AND WHERE NEEDED? HOW WILL PRIORITIES BE ESTABLISHED?

COMMENTS INCLUDED:

“Habitat improvement projects dependent for funding upon other fish habitat capability-reducing activities (e.g. those funded by timber-sale generated KV funds) are insufficient.”

“Wenatchee's Fisheries Inventory/Improvement program, outlined on page IV-44 (Plan) indicates that an average of \$111,000/year will be spent. Of this amount \$86,000 (77%) will be KV monies; the remaining \$25,000 (23%) will be appropriated funds. In other words, better than three quarters of the anticipated habitat work will be entirely contingent upon implementing a successful, profitable timber sale program!”

“Page IV-38: Several alternatives would include the diversion of KV funds to provide fishing access. This would further diminish the availability of these relatively modest funds for correcting past environmental damage on the Forest and fulfilling newly emerging needs in a timely manner.”

“Initially, fish habitat damaged by past timber sale activities will not likely receive benefit from these funds unless a new sale that generates KV dollars occurs in the same general area. Assuming that most new sales will be laid out in new areas, then most damage from earlier sales will likely stay unfixed.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0579, 0580, 0644, 0716, 1977, 2206, 2737, 2893, 3223, 3320, 3394, 3550, 3776, 3796, 4169, 4270, 4467, 4471, 4485, 4494

FOREST SERVICE RESPONSE:

It is the goal of the Forest Service to at least maintain and improve fish habitat capability. We have re-examined and increased the emphasis on the fish habitat management program as is reflected in updated standards and guides and monitoring guidance displayed in Chapters IV and V of the Forest Plan. Direction to create 5-year program plans and sub-drainage objectives will help prioritize how available funds will be expended.

Habitat improvement work is just a portion of the total fish habitat management program and KV funds are just one way of funding habitat improvement. Alternatives with greater timber emphasis should have more KV funds available, but those alternatives also carry greater risk of habitat degradation. While it is the Forest Services' intent, as discussed in Chapter IV of the FEIS, to use KV to help mitigate past adverse impacts, with greater resource development there is a relatively higher chance that KV funds would be needed to mitigate new problems and it would be more difficult to achieve the goal of maintaining and improving fish habitat. While it is true that some timber harvest activity would occur in new areas, other harvest activity, depending upon the alternative, will occur in previously entered sub-drainages. There is some flexibility in expending KV funds in that they need to be spent in the sale area not necessarily the cutting area and there is some flexibility in designation of the sale area.

Habitat improvement budgets were initially developed based upon the emphasis of the alternatives. While the relative distribution of habitat improvements funds have remained basically the same between the DEIS and FEIS, total funding to implement the programs was increased and the estimated budget needed for habitat management, including administration, inventory, monitoring and coordination with other resources activities, has been increased.

102 THERE WERE SEVERAL COMMENTS QUESTIONING STATEMENTS IN THE DEIS THAT FISH PRODUCTION ON THE FOREST MAY BE LIMITED BY COLD WATER TEMPERATURES AND THAT ACTIVITIES WHICH RAISE TEMPERATURE MAY BENEFIT FISH PRODUCTION.

COMMENTS INCLUDED:

“Page IV-123, Paragraph 2: It is suggested here that timber harvest along the stream corridors may increase fish production due to warming effects. We offer that many factors, in addition to temperature, limit productivity in anadromous fish streams. We recommend that the potential benefits of temperature elevation be carefully weighed against the possibility for excessive heating, decreased summer stream flow and increased sedimentation.”

“While discussing wildlife and fish (III 4-5), for example, the Plan states: ‘water quality may often limit the Forest’s fisheries production potential. For instance, most of the streams exhibit very low water temperatures year-round due to their high altitude and have low nutrient content which results in slow fish growth.’ Such statements imply that cold, relatively sterile water is of low quality. This is simply not true.”

“The provision of higher water temperatures may be a benefit in some stream reaches, but can eventually create high temperature problems as the same water moves down stream, In addition, higher summer temperature benefits can be at the expense of winter rearing habitat conditions. These potential trade-offs should be added to the narrative.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0508, 0580, 0716, 3065, 3191, 3235, 3464, 3550, 3611, 4485

FOREST SERVICE RESPONSE:

Cold water and low nutrient levels may limit salmonid production relative to other geographic areas or river systems but fish habitat is a complex matter and production depends upon many factors of which water temperature and nutrients are two. We recognize that fish have adapted to local environmental conditions and changes in these conditions to increase production must be carefully considered. It is also important to minimize the potential for habitat changes from other land use activities, until the impacts of such changes are understood. For these reasons, the Forest has adopted new Riparian and Fish Management standards to guide habitat protection and management activities (see Chapter IV of the Forest Plan).

103 MANY RESPONDENTS QUESTIONED THE ASSUMPTION THAT UNDER ALL ALTERNATIVES FISH PRODUCTION FROM THE FOREST WOULD INCREASE, NO MATTER THE LEVEL OF FOREST MANAGEMENT ACTIVITIES AND THAT HABITAT ENHANCEMENT, INCLUDING EXPENDITURES OF KV FUNDS COULD MITIGATE ANY HABITAT LOSSES.

COMMENTS INCLUDED:

“The conclusion that the Forest’s fish production capabilities would increase under any alternative is far too optimistic, since no losses of any type are calculated for environmental disturbance activities such as timber harvest, associated road building and grazing. Funding for fisheries work is treated as enhancement only, even though much of it would be diverted to problems created from past Forest management practices. The plan does not acknowledge any major risk of future environmental damage exhausting available funding sources.”

“The descriptions and analysis of water quality and related elements are disconcerting in that no degradation is promised even though the data and information provided indicate otherwise. For example, sedimentation is increasing over the life of the Plan, but at the same time water quality and anadromous fish production are supposed to increase; a relationship contrary to our experience.”

“We see fisheries benefits in Alternative B due to large expenditures of K-V funds. In essence, this alternative says that you can degrade habitat, but you will then have the money to mitigate the impacts.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0035, 0563, 0579, 0580, 0612, 0635, 0641, 0716, 0836, 0868, 0870, 1300, 1302, 2007, 2012, 2131, 2205, 2206, 2235, 2734, 2833, 2877, 2919, 2956, 2996, 3067, 3081, 3090, 3163, 3181, 3183, 3191, 3199, 3203, 3205, 3223, 3225, 3242, 3288, 3320, 3362, 3403, 3410, 3550, 3611, 3645, 3742, 3769, 3800, 3813, 3911, 3936, 3992, 4035, 4037, 4070, 4139, 4142, 4167, 4169, 4194, 4259, 4270, 4277, 4417, 4434, 4444, 4477, 4485, 4493, 4511, 9093, 9094, 1578S, 2178S

FOREST SERVICE RESPONSE:

The Wenatchee National Forest does not have a model, specific to the Wenatchee, to predict impacts on fish habitat from various land management activities. It is our intent to maintain fish habitat at least at current levels, and habitat on the Forest should show an improving trend. Since the Draft, we have added Forest-wide Standards and Guidelines for Riparian Areas, added to the Forest-wide Fish standards, increased substantially the estimated budgets necessary for fisheries and watershed management and established new monitoring guidance. It is assumed that under all alternatives except NC, that the Standards, use of Best Management Practices (BMP's) and improved coordination with other resource management activities will at least maintain fish habitat. Habitat rehabilitation dollars would also be increased to better reflect the cost of habitat improvement.

While assuming that improved standards and use of BMP's will maintain fish habitat, the Forest Service recognizes that BMP's are established to minimize, not eliminate, adverse impacts. The alternatives with the greater levels of ground-disturbing activities exhibit greater risk of not meeting habitat goals. This relationship is discussed in Chapter IV of the FEIS. We also agree that habitat "enhancement" in many cases is really habitat rehabilitation for past activities and that habitat rehabilitation techniques are not as effective in maintaining habitat capability as maintaining natural conditions. The alternatives with greater ground disturbing activities carry a greater risk that habitat rehabilitation funds will be needed to mitigate future actions and thus again run more risk of not meeting current fish production objectives. (See Appendix J of the FEIS, Best Management Practices and Chapter IV of the Forest Plan, Standard and Guidelines.)

104 SMOLT HABITAT CAPABILITY ESTIMATES SHOULD INCLUDE THE POTENTIAL FOR SOCKEYE SALMON PRODUCTION IN THE LAKE CLE ELUM SYSTEM.**COMMENTS INCLUDED:**

"We feel that table III-18 (DEIS III-47) is in error. Smolt Habitat Capability in the Yakima River is estimated in your table to be 0. In fact, studies are just beginning to determine the feasibility of fish passage at Lake Cle Elum. If passage is possible there are many miles of good habitat above the Lake, and we would not want the Forest Service to preclude any management options based on under estimations of potential smolt yield. We understand that predictions of smolt yield are in flux in the Yakima Basin at this time, but would like to see a further refinement of this number."

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

3550

FOREST SERVICE RESPONSE:

The Forest Service recognizes the current studies in the Yakima Basin and has included an estimate of Smolt Habitat Capability for sockeye salmon in Lake Cle Elum in Chapter III of the FEIS.

105 THE RESPONDENTS FEEL THAT THE FOREST SERVICE'S RESPONSIBILITIES INCLUDE MORE THAN MERELY FURNISHING A GIVEN AMOUNT OF HABITAT. PART OF THE CONCERN BEHIND PROTECTION OF NATURALLY SPAWNING STOCKS IS THE DESIRE TO PROTECT UNIQUE GENE POOLS THAT WILL BE NEEDED TO RESTORE THE BASIN'S FISHERIES.

COMMENTS INCLUDED:

“The Forest Service has often informed the Columbia River Intertribal Fish Commission and Tribal staff that the Forest Service is only responsible for supplying smolt habitat capability and that there is far more capable habitat than there are smolts. The Forest Service’s responsibilities include more than merely furnishing a given amount and habitat. The Forest Service must identify that which is being utilized by fish and, to the extent it can, that which will be utilized through either United States vs. Oregon Fish and Wildlife Program enhancement measures.”

“There are healthy populations of native trout which do not survive over fishing and loss of habitat.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0062, 0528, 0716, 0847, 1300, 2035, 2132, 2206, 2737, 2749, 2752, 2919, 2996, 3065, 3084, 3205, 3223, 3225, 3255, 3288, 3320, 3394, 3410, 3495, 3548, 3640, 3742, 3775, 3813, 3837, 3876, 4035, 4152, 4277, 4294, 4405, 4434, 4444, 4485, 4493, 4494, 4495, 4496, 4501, 4505, 9007

FOREST SERVICE RESPONSE:

While it is the primary responsibility of the Forest Service to furnish habitat, it can go beyond this by working cooperatively with Tribal, State and other Federal fisheries personnel to achieve objectives resulting in stronger fish runs in the Columbia River Basin and meeting resident trout objectives. Specifically, as stated in Chapter V of the Forest Plan, population trends of salmon, steelhead and native trout will be monitored cooperatively with the Washington Departments of Fisheries and Wildlife and the Tribes. Monitoring will be done to gauge conformance with standards and guidelines found in Chapter IV of the Forest Plan, and with the Best Management Practices found in Appendix J of the FEIS. We are currently working with the Environmental Protection Agency and Washington Department of Ecology in developing our monitoring program. In addition, the Forest has established a standard to develop fish habitat management objectives by sub-drainage. Since we are interested in the efficient utilization of habitat, the Forest Service will certainly share information and coordinate in identifying opportunities to best meet fisheries production objectives.

106 WHAT IS SMOLT HABITAT CAPABILITY (SHC)?

COMMENTS INCLUDED:

“What is smolt habitat capability and how is it measured? What parameters are identified in the field as a guide to future smolt habitat capability?”

“The FEIS should explain how smolt habitat capability is calculated.”

“We have some questions about the reliability of assumptions regarding smolt habitat capability when no detailed surveys have been done. Additionally, what precisely is the method for defining smolt habitat capability?”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0716, 3550, 4485

FOREST SERVICE RESPONSE:

Smolt Habitat Capability Index is a measure of the productive capability of habitat on the Forest to produce smolts. SHC is usually shown as:

a. Existing SHC: The number of smolt now being produced with existing escapement levels in existing freshwater habitat.

b. Potential SHC: The number of smolt that are capable of being produced assuming there is sufficient adult escapement to fully seed existing freshwater habitat.

c. Potential SHC with Full Enhancement: The number of smolt that are capable of being produced, assuming sufficient capital investments have been made to maximize the freshwater habitat. This also assumes there is sufficient adult escapement to fully seed the existing and enhanced habitat.

Estimating smolt habitat capability for the Wenatchee National Forest is difficult due to lack of information and the fact that, generally, the anadromous fish streams are under-seeded. There is also disagreement between individuals in other agencies as to what the actual SHC is on the Wenatchee National Forest. For further information on how SHC was calculated readers are referred to Documentation for Formulation of Fisheries Outputs for the Wenatchee Forest Plan, Second Edition, by Ken MacDonald.

Generally speaking, Potential SHC found in Chapter III of the FEIS, was estimated based upon work by other agencies. These numbers are estimates and will need to be updated as more information becomes available. The Forest has scheduled an accelerated stream inventory program to quantify fish habitat. The Forest monitoring program includes an element to further define SHC and monitor trends in habitat capability, in cooperation with other fish management and Tribal agencies. Forest-wide Fish Standards call for establishing fish habitat management objectives for sub-drainages. As these programs are implemented the Forest should be better able to define SHC.

107 STANDARDS AND GUIDELINES FOR FISH HABITAT ARE FELT TO BE LACKING SUBSTANCE AND THERE IS CONCERN THAT THE STANDARDS AND GUIDELINES AS DISPLAYED IN THE DRAFT FOREST PLAN WILL NOT ADEQUATELY PROTECT FISH HABITAT.

COMMENTS INCLUDED:

“We feel that the standards and guidelines section is lacking in substance. What are the standards to be used to insure that there is adequate woody debris in streams? What stream temperature guidelines will be used? Is there a baseline input of sediment that is acceptable?”

“Page IV-71 through 133, 1st para; Forest Wide Standards and Guidelines: The Standards and Guidelines that affect fish and wildlife are inadequate in that they do not provide the detail that will be necessary for on-the-ground guidance to Forest Service personnel.”

“The DEIS lists the EW-2 Riparian Protection Zone Prescription as being the primary fisheries resource mitigation device. It states that the primary objective of this prescription is to maintain optimum riparian habitat for fish and wildlife and to protect wetlands. However, this prescription allows both shelterwoods and clearcuts in the riparian zone. How does this timber management in the riparian zone create better fish habitat...? How does increasing sediment delivery to the stream and decreasing the availability of large organic debris benefit fish habitat?”

LETTERS WITH COMMENTS ON THIS SUBJECT:

2893, 3550, 4444, 4485, 4495, 4501, 9094

FOREST SERVICE RESPONSE:

The Standards and Guidelines in Chapter IV of the Forest Plan establish the framework for management of the Forest. Improved fish habitat management is an objective of this plan and management of riparian areas is key to meeting habitat management objectives. Forest-wide standards for fish and riparian habitat management have been upgraded significantly in the final plan. Forest-wide riparian standards for fish and wildlife habitat are now included in addition to the EW-2 Management Prescription (see Chapter IV of the Forest Plan). Measurable standards have been established for temperature, sediment, in-channel wood, future wood input and ground cover. Furthermore, standards and guides have been developed for non-fish bearing streams, recognizing the importance of managing an entire watershed in order to meet fish habitat and water quality objectives.

These standards establish the desired future condition for riparian and fish habitat and along with the EW-2 Management Prescription provide the framework necessary for forest managers to make decisions regarding fish and riparian habitat.

108 THE DRAFT FOREST PLAN LISTED CHINOOK SALMON AND RESIDENT CUTTHROAT TROUT AS FISH MANAGEMENT INDICATOR SPECIES (MIS). IT HAS BEEN QUESTIONED WHETHER CHINOOK SALMON AND CUTTHROAT TROUT ADEQUATELY REFLECT THE HABITAT NEEDS OF ALL FISH SPECIES. IT WAS ALSO QUESTIONED WHETHER THE FOREST NEEDED TO INCLUDE AN ANADROMOUS FISH MANAGEMENT REQUIREMENT (MR).

COMMENTS INCLUDED:

“Monitoring element 7.1 addresses Management Indicator Species (MIS). For anadromous fish, chinook salmon are proposed as the MIS. Sockeye salmon have clearly different habitat requirements, as do coho and steelhead. Chinook habitat alone does not adequately reflect the needs of these other species.”

“After combing the DEIS, the proposed plan and the appendices, we have been unable to find the MMR for anadromous fish.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

FOREST SERVICE RESPONSE:

The National Forest Management Act of 1976 (NFMA) directed the Secretary of Agriculture to develop regulations to guide Forest Planning that would in part: "...provide for diversity of plant and animal communities..." In addition, this Act directed that protection would be provided "...where timber harvests are likely to seriously adversely affect water conditions or fish habitat." Each Forest, in cooperation with the State Wildlife Agency, was to identify a list of indicator species, or species associated with a certain type of habitat whose response to changes in habitat may indicate the effects of the habitat change on other species with similar habitat needs. Categories to be considered for selection of indicator species included: Endangered and threatened plant and animal species identified on State and Federal lists for the planning area are; species with special habitat needs; species commonly hunted, fished or trapped; non-game species of special interest; and other species believed to represent a larger group with similar biological needs.

Between the draft and final the Forest has reviewed its list of Indicator Species and for fish has decided to include all anadromous fish species being managed on the Forest including spring and summer chinook salmon, sockeye salmon and summer steelhead trout. The Bull trout has also been added because it is listed by the USDI Fish and Wildlife Service as a Category 2 species (candidate species for possible listing-Endangered Species Act) and a Regional Forester sensitive species.

Management requirements (MR's) were developed in response with 36 CFR 219.27 to assure that the basic productivity of the land and water resources remains unimpaired. In order to meet this direction, certain Management Requirements (MR's) were established for fish and wildlife species (see Appendix I of the FEIS). These include soil and water conservation, plant and animal density, and population viability.

It was determined that the soil and water conservation management requirement would be adequate for maintenance of viable populations of fish and no management requirement was developed specifically for fisheries.

Forest-wide standards for soil and water, including a new Best Management Practice Appendix J, a new list of Forest-wide Riparian Standards and the EW-2, Riparian Habitat Protection Zone, are the avenues selected by the Wenatchee National Forest to achieve the Soil and Water Conservation Management Requirements.

109 SEVERAL AGENCIES, INCLUDING WASHINGTON DEPARTMENT OF FISHERIES AND THE COLUMBIA RIVER INTERTRIBAL FISH COMMISSION CALLED FOR A FOREST SERVICE STUDY OF THE CUMULATIVE IMPACTS OF ALL COLUMBIA BASIN FOREST PLANS WITHIN THE RANGE OF ANADROMOUS SALMONIDS.

COMMENTS INCLUDED:

"The analysis should have considered the effects of the Forest, and activities therein, on the Columbia Basin as a whole with respect to fish and wildlife resources and their use."

“To adequately assess the environmental impacts of its actions as required by NEPA, the Forest Service must study and disclose the cumulative impacts of all 17 forest plans listed.”

“A final possibility to consider would be special treatment of anadromous fish (salmon and steelhead) via a separate supplemental EIS process, possibly for all Forests in the Columbia Basin.”

FOREST SERVICE RESPONSE:

Chapter IV, The Environmental Consequences chapter of the FEIS, refers the reader to an unpublished document which summarizes the aggregate effects of the decision on fisheries and other resources. This document started with aggregation of 19 Draft Forest Plans and is updated with the selection of each Final. Chapter IV of the FEIS shows the effects on and from other forests, agencies and landholders affected by or having effects on the Forest.

The document referenced is: Forest Plan Aggregate Outputs and Effects Staff Paper for the Regional Forester, Region 6 (Draft August 5, 1988). This will be updated as each Forest completes its Forest Plan.

110 MANY RESPONDENTS NOTED THAT MOST DAMAGE TO FISH RUNS IN THE COLUMBIA BASIN AND SPECIFICALLY TO THE STREAMS WITHIN THE WENATCHEE NATIONAL FOREST HAS OCCURRED BELOW THE NATIONAL FOREST BOUNDARY, AND THAT MOST OPPORTUNITIES FOR IMPROVING ANADROMOUS FISH RUNS ARE DOWNSTREAM OF THE FOREST BOUNDARY. HOWEVER, THEY CONTENDED THE WENATCHEE NATIONAL FOREST MUST RECOGNIZE THAT PAST LAND MANAGEMENT PRACTICES HAVE DAMAGED FISH HABITAT AND THAT HABITAT ON THE FOREST IS IMPORTANT TO MEETING ANADROMOUS FISH PRODUCTION GOALS. THE ANADROMOUS FISH RUNS CAN ONLY BE RESTORED IF STATE, FEDERAL, AND TRIBAL LAND, WATER, AND WILDLIFE MANAGERS ADOPT A COORDINATED “GRAVEL TO GRAVEL” MANAGEMENT APPROACH TO THIS VALUABLE AND MOBILE RENEWABLE RESOURCE.

COMMENTS INCLUDED:

“We would like to state at the outset, that although it is claimed repeatedly that increases in fish to the forest will largely be due to increased escapements, it is possible to sustain and increase escapement only if high quality fish habitat is provided. Therefore, it is of the utmost concern to the Yakima Nation that the best possible habitat for salmon and steelhead is available on forest lands. We also feel that diminished numbers of fish within the forest is not only due to downstream effects, but also because of environmental disturbance, use as grazing, road building and timber harvest within the Forest itself.”

“The text indicates that anadromous fish runs have declined solely due to commercial fishing, irrigation and mainstream Columbia River dams. We suggest that you include factors permitted on the Forest that have also contributed to this decline such as logging, grazing, road building, etc.”

“While the Forest Service can rightfully blame downstream problems for much of the harm inflicted on anadromous fish, such blame does not obviate the Forest Service’s responsibility to protect anadromous fish and the need for all parties with management authority that affects these fish to work together to improve the fishery resource ”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0563, 0716, 3205, 3514, 3550, 3800, 3949, 4142, 4444, 4477, 4485, 4498, 4501, 4509, 9034

FOREST SERVICE RESPONSE:

Chapter III of the FEIS recognizes that the survival and enhancement of anadromous fish runs within the Columbia River and tributaries requires coordination and cooperation by State, Federal and Tribal agencies and managers. The Forest Service fully supports the statement. The Wenatchee Forest has been an active contributor to sub-basin planning sponsored by the Northwest Power Planning Council.

We recognize that habitat on the Forest will play an important role in achieving anadromous fish production goals for the Yakima, Wenatchee and Entiat sub-basins. The goal of the Forest Plan is to maintain and improve fish habitat. Forest-wide Riparian Standards and Guides have been upgraded to help achieve the goal and fish standards call for establishing fish habitat objectives, in cooperation with the State, Federal, and Tribal entities, by sub-drainage.

Past land management practices on Forest may have contributed to the decline of fish numbers, although without surveys it is difficult to document reduced anadromous fish production or effects on habitat capability. Chapter III of the Plan does recognize land management activities may be partially responsible for loss of fish production and fish habitat.

111 THE FOREST PLAN WAS DEVELOPED WITH A LACK OF FISH HABITAT DATA. HOW DID THE FOREST CALCULATE THE EFFECTS OF LAND MANAGEMENT ACTIVITIES ON FISH HABITAT AND PRODUCTION. HOW IS THE FOREST GOING TO OBTAIN HABITAT INFORMATION NEEDED FOR FUTURE PLANNING AND TO MONITOR LAND MANAGEMENT EFFECTS ON FISHERIES?

COMMENTS INCLUDED:

“The DEIS states in several sections that very little data exists to evaluate forest stream habitat and fish populations. How were the effects and environmental consequences to fisheries calculated without sufficient data? How will data which is collected in the future be integrated into the Plan?”

“But what bothers us even more is that there is no clearly defined plan to obtain the missing data. Throughout the fish sections we encounter statements indicating that the information presented is appropriate based on incomplete knowledge or is simply a judgment call, but nowhere do we find a strategy for filling in the gaps.”

“The Draft Plan does generally identify fish habitat inventories as a priority and element 7.1 of the Monitoring Plan describes monitoring for fish habitat capability in the four major watersheds on the WNF. However, we find no discussion of when and how the needed habitat inventories will be completed.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0127, 0376, 0441, 0502, 0508, 0579, 0580, 0582, 0608, 0612, 0716, 0730, 0748, 0791, 1947, 1970, 2032, 2078, 2119, 2132, 2164, 2786, 2846, 2847, 2849, 2863, 2919, 2947, 2957, 2969, 2980, 2995, 3090, 3111, 3138, 3177, 3221, 3223, 3225, 3229, 3231, 3233, 3235, 3251, 3256, 3272, 3307, 3394, 3403, 3550, 3553, 3557, 3593, 3621, 3683, 3710, 3769, 3811, 3824, 3871, 3919, 3936, 3992, 4005, 4112, 4139, 4169, 4210, 4236, 4269, 4310, 4405, 4423, 4444, 4485, 4493, 4495, 4496, 4501, 4511, 9031, 9094

FOREST SERVICE RESPONSE:

Because the Forest Service had little fish habitat data when the Draft DEIS and Plan were written, we were forced to make some assumptions regarding the environmental consequences of different alternatives on fish habitat. These assumptions were based upon available information, professional judgement and local knowledge. We recognize the lack of data makes it not only difficult to make planning decisions but also to implement an effective fish habitat management program. As outlined in Appendix A and in the Forest-wide Standard and Guidelines in Chapter IV of the Forest Plan, we will implement an accelerated stream inventory program, with the goal of having all fish-bearing streams surveyed within four years of completion of the Forest Plan. Streams will then be scheduled to be re-surveyed every 10 years at a minimum. This inventory program began in fiscal year 1989.

In addition, we have updated the fisheries/watershed monitoring guidance in Chapter V of the Plan. The monitoring guidance outlines the framework for developing a yearly fish/watershed monitoring plan, to be coordinated with State fish and water quality agencies and the Tribes. The monitoring guidance includes baseline monitoring and implementation and effectiveness monitoring of standards and guidelines. The information needs section in Chapter II of the Forest Plan displays research to validate various fish and riparian habitat standards.

The Forest's goal, as displayed in Chapter IV of the Forest Plan is to maintain or enhance fish habitat quality and distribution. If monitoring shows fish habitat quality and/or quantity to be decreasing then standards, guidelines or management practices will need to be changed as displayed by the feedback loop illustrated in Chapter V of the Plan.

112 MANY RESPONDENTS URGED THAT FISH MANAGEMENT PROGRAMS AND RESEARCH RECEIVE GREATER EMPHASIS ON THE WENATCHEE NATIONAL FOREST.

COMMENTS INCLUDED:

“For starters. I see the need for a *Journeyman* Fisheries Biologist as one of the Key Forest Staff.”

“I also feel more adequate research is needed to know what are the effects of such massive changes on fishing. Will the watersheds provide enough summer flow?”

“Increase fisheries research in the WNF, both short and long term.”

“Second, the importance of the Forest's fisheries and watershed cannot be over-emphasized. I would urge that the U.S. Forest Service conduct further research and monitoring of the impacts of logging and roading on fish habitat.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDED:

0040, 0376, 0511, 0522, 0620, 0626, 0862, 1300, 1305, 1984, 1997, 2032, 2079, 2085, 2737, 2748, 2847, 2893, 2932, 2940, 3047, 3084, 3111, 3199, 3205, 3221, 3223, 3245, 3251, 3408, 3550, 3563, 3742, 3792, 3837, 3862, 3911, 3992, 4037, 4142, 4194, 4449, 4471, 4485, 4495, 4501, 4505, 9031, 9046

FOREST SERVICE RESPONSE:

The Forest Service recognizes that the Wenatchee National Forest contains valuable fish habitat. In response to the need to properly manage fish habitat, we have increased the emphasis on fisheries in the Final Forest Plan. The fish habitat management budget has been reviewed and upgraded, new forest-wide standards for fish and riparian habitat management have been added and the monitoring plan is being revised with input from Washington Department of Ecology and the Environmental Protection Agency. In addition, the Information Needs Section in Chapter II of the Plan has been revised with a list of research needs and a research budget included in the Forest fish and watershed management budget.

113 CONCERN WAS EXPRESSED REGARDING FISH HABITAT AND PRODUCTION ASSUMPTIONS STATED FOR ALTERNATIVE NC.

COMMENTS INCLUDED:

“Supplement page II-24: The comment in this table that fishing habitat numbers would decline flatly contradicts the comment on page II-9 that: ‘fish habitat capability should be maintained at current levels. Demand for fish and fishing at the present level of success, should continue to be met for the first decade’.”

“‘Fish habitat and populations would be expected to be maintained or follow the trend of the last few years.’ The trend in the anadromous fish run the ‘last few years’ has been up significantly! You imply there is no improvement. There are no grounds for your implication that they will be negatively impacted.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

1578S

FOREST SERVICE RESPONSE:

The Forest Service is responsible for managing aquatic habitat on National Forest Land. The numbers of anadromous fish returning to the Forest depends upon a variety of factors including habitat on the Forest, passage at mainstream Columbia River dams and harvest levels, among others.

Riparian and fish habitat standards included in other alternatives would not be applied in Alternative NC. Riparian habitat protection under Alternative NC would include only those measures necessary to meet the minimum requirements as specified in the Washington State Forest Practice Rules and Regulations. Forest-wide Riparian Standards included in Alternatives A-J emphasize management for fish and wildlife habitat adjacent to streams.

While the recent trend in anadromous fish runs has been up in recent years, and this trend is expected to continue, the increase is mostly due to factors off Forest. Due to the lack of Riparian standards and prescriptions in NC and because NC would allow timber harvest on more acres, including acres classified as unsuitable in other alternatives, Alternative NC poses the greatest risk of a reduction in fish capability in later decades.

RIPARIAN AND WATER

114 MANY REVIEWERS EXPRESSED CONCERN OVER THE EFFECTS OF PROPOSED MANAGEMENT ACTIVITIES ON RIPARIAN AREAS ON THE FOREST. SEVERAL REVIEWERS CHALLENGED THE ADEQUACY OF THE RIPARIAN MANAGEMENT PRESCRIPTION (EW-2) AND PROVIDED SUGGESTIONS FOR IMPROVEMENT OF THIS DIRECTION.

COMMENTS INCLUDED:

“The scientific community has repeatedly written of the importance of riparian zones for fish and wildlife. This view can be found in any number of comments submitted on Draft Plans already released. Your plans for riparian zone protection are inadequate to protect this valuable resource.”

“Aquatic habitat on the Forest is an essential part of the habitat base that will eventually be required for expanding Columbia River fish production... All existing and potential anadromous fish habitat in the Forest should be maintained in its present state or improved. This includes stringent protection for riparian zones.”

“The riparian-aquatic habitat protection zone of the proposed plan must be made more restrictive. The riparian management prescription should assure preservation of riparian communities. The use of off-road vehicles must be prohibited in riparian zones.”

“Further guidance on the amount of shelter trees to be left within the zone should also be provided. How many trees per acre would need to be left to assure adequate woody debris recruitment, and how is blowdown and natural mortality factored into this number?”

“In addition this riparian protection should be extended to all Class III streams, not just those with fish populations. Upstream activities can have a major impact on downstream siltation and stream temperatures. There is no excuse for simply cutting directly over the top of smaller creeks and streams.”

“We believe that your standard of 15-20 trees per acre leaves insufficient canopy for optimum riparian habitat. We recommend selective harvest for riparian areas.”

“We would like to suggest that on very steep slopes (70%) that there be no harvest below the first topographic break upslope from the stream. Also we have some concern that firewood cutting can have deleterious effects on successful management in this area. We would like to see no firewood cutting of live, dead or downed material be allowed within 100 feet of any Class I, II or III stream. It is only in this fashion that recruitment of woody debris can be guaranteed.”

“Riparian zones make up a small portion of the WNF, but support a larger number of species than any other management area. Because of this abundance, we support the prescription goal of optimizing habitat for wildlife. However, we do not agree that your proposed management will attain the optimization you seek... We suggest that canopy cover should exceed 60% to be more optional for wildlife.”

FOREST SERVICE RESPONSE:

The Forest Service recognizes the sensitivity of riparian areas. We have substantially reworked riparian standards in response to public comment and internal review. Forest Plan Chapter IV has been modified to include goal, objective and desired future condition sections for riparian areas. A separate Forest-wide Standard and Guidelines section has also been developed for riparian area management. The EW-2 prescription has been modified to link with these new Forest-wide Standards and Guidelines.

The Forest goal is to maintain and enhance riparian management areas to perpetuate their distinctive resource values. The Plan calls for riparian management objectives to be established for all projects based upon both sub-drainage and site conditions. Management decisions will be made in favor of riparian dependent resources (e.g., water quality, fish and wildlife habitat) where conflicts exist with man's use.

The new additions to the Final Plan outline the management framework required to meet this goal for riparian areas on the Forest. The Forest-wide standards and guidelines for riparian areas provide guidance for planning and standards necessary to assure that water quality, fish and wildlife habitat meet goals and objectives. Measurable standards have been included for sediment, temperature, pool frequency, in-channel large wood, ground cover and potential large wood. In addition, standards and guidelines have been established for non-fish bearing waters, recognizing the importance of managing the entire watershed system in order to meet objectives. The “Forest in Ten Years” and “Forest in Fifty Years” sections in Forest Plan Chapter IV provide a narrative description of the desired future condition to be achieved through application of these standards and guidelines. The inventory and monitoring direction in the Forest Plan provide the mechanism to evaluate our success in achieving the desired future condition.

115 MANY REVIEWERS EXPRESSED CONCERN OVER THE EFFECTS OF PROPOSED MANAGEMENT ACTIVITIES ON WATER QUALITY AND QUESTIONED THE ADEQUACY OF THE ANALYSIS IN CHAPTER IV OF THE DEIS. SEVERAL REVIEWERS QUESTIONED THE FOREST'S MANAGEMENT DIRECTION REGARDING THE PROTECTION OF DRINKING WATER QUALITY (MUNICIPAL SUPPLY WATERSHEDS). SOME REVIEWERS REQUESTED THAT THE FINAL DOCUMENTS INCLUDE A BETTER DESCRIPTION OF THE MANAGEMENT PROCESS TO BE USED TO INSURE THE PROTECTION OF WATER QUALITY AND FISH HABITAT.

COMMENTS INCLUDED:

“Nowhere in the calculations does the Forest Service consider the cost to local governments of degraded water quality caused by Forest Service management activities.”

“It is imperative the Forest Service should do everything possible to insure adequate protection of the water resource. Total annual water quantity is less important than water quality and timing of flow. The Forest Service has inadequately evaluated the impacts its proposed plan would have on water quality and the impacts which can result from having a degraded water supply.”

“Standards and guidelines for fisheries and for water, soil and air, need to be more fully discussed/developed in the Final EIS/Plan.”

“The effects of various commodity management activities on both in-stream water quality and on ground water supplies for local communities is not adequately evaluated.”

“The Forest Service must further realize that there exist no ‘best management practices’ that can completely eliminate increased sedimentation from roads and logging.”

“The DEIS shows no substantial differences between alternatives in impacts on instream values, particularly water quality and fisheries. Based on the greatly disparate levels of roading and timber harvesting between alternatives, please provide data and other information to substantiate the apparent lack of difference in impact levels.”

“The process for managing Forest activities is not sufficiently detailed that we can be assured adverse environmental effects, particularly to water quality and fisheries, will be prevented. We suggest more fully describing the management processes of the WNF.”

“[The DEIS indicates that] water quality standards will be met on the average. We are concerned with the potential impacts on fish from events where standards are exceeded, and believe this should be discussed in your documents.”

“Did the WNF report its water quality sampling violations to the Washington Department of Ecology? What response did Ecology make to the water quality violations documented in Table II-19?”

“Another big concern is watershed protection. The DEIS predicts timber harvest within roadless areas will increase runoff thus benefiting domestic and irrigation water users. But the question of the timing of the runoff and the quality of the water is not adequately addressed. With increased road building in early spring aggravating flooding and high water problems. Streamflows will be reduced during the time more water is needed for irrigation and fish passage. Again the intermingled ownership of land complicates the problem.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0035, 0043, 0044, 0152, 0395, 0496, 0508, 0579, 0582, 0794, 0820, 0823, 0828, 1962, 1972, 1978, 2016, 2026, 2125, 2201, 2456, 2723, 2725, 2739, 2748, 2749, 2750, 2752, 2769, 2789, 2803, 2849, 2850, 2854, 2877, 2879, 2960, 2963, 2969, 3015, 3047, 3080, 3142, 3171, 3190, 3205, 3210, 3223, 3246, 3250, 3255, 3256, 3270, 3308, 3323, 3329, 3373, 3388, 3514, 3519, 3550, 3572, 3583, 3603, 3611, 3621, 3622, 3794, 3862, 3875, 3877, 3936, 3949, 4019, 4022, 4066, 4069, 4142, 4169, 4176, 4270, 4277, 4408, 4432, 4444, 4455, 4466, 4477, 4493, 4495, 4498, 4502, 4510, 9041, 9043, 9074, 9094

FOREST SERVICE RESPONSE:

Chapter IV of the FEIS includes a more detailed disclosure of the potential impacts of forest non-point source activities on water quality and fish habitat. The Forest-wide Standard and Guideline for Protection of Water Quality has been revised to strengthen and clarify management direction. A new FEIS appendix (Appendix J) has been added which describes Best Management Practices (BMP's) and addresses their relation to water quality standards. In addition, numerous other changes have been made to the Forest-wide Standards and Guidelines that provide direction that promotes the protection of water quality (e.g., the new Forest-wide Standards and Guidelines for Riparian Areas and additions to the Standards and Guidelines for Fish Habitat).

The Environmental Protection Agency recognizes BMP's as the primary mechanism to enable the achievement of water quality standards for non-point source activities. As stated in FEIS Appendix J, water quality standards are used as objectives towards which practices are designed in order to protect the beneficial uses of water. Water quality standards are the yardsticks against which the effectiveness of BMP's is tested.

As a Designated Management Agency, the Forest Service will continue to work cooperatively with the State of Washington and other entities towards the goal of protecting water quality. Management objectives will be directed at meeting both State Water Quality Standards and applicable Federal law. BMPs for the protection of water quality will be more fully developed in area and project level planning to account for site-specific conditions. We recognize that BMP's will not completely eliminate impacts from management activities. The intent of BMP's is to minimize sedimentation, temperature increases and other water quality impacts to levels that adequately protect the beneficial uses of water.

Water Quality Management Process - As described above, the management direction for the protection of water quality has been expanded and clarified in the Final Forest Plan. The Forest-wide Standard and Guideline for Protection of Water Quality has been updated to describe the Forest Service Non-point Source Management System. This System involves a six-step process for the implementation of BMPs necessary for the protection of beneficial uses. This System is described in more detail in FEIS Appendix J and in the document entitled General Water Quality Best Management Practices, Pacific Northwest Region, 11/88.

Drinking Water Quality - Domestic use of water is recognized as a sensitive beneficial use of water. The Forest-wide Standards and Guidelines for management of public supply watersheds and protection of water quality provide direction for protecting beneficial uses, including application of BMP's. In those watersheds in which domestic use is an identified use, water quality management objectives and development of BMP's will reflect this sensitivity.

Groundwater - The potential effects of forest management activities on groundwater is discussed in FEIS Chapter IV. Research on effects of most forest management activities on the water resource does not indicate that groundwater problems, including temperature, are likely to result.

Groundwater can be impacted through the storage and use of fertilizers, pesticides, petroleum products, sewage/solid wastes, and other chemicals (e.g., chemicals used in recovery of minerals). The potential for impacts to water quality from the use or storage of any of these materials would be specifically addressed through more specific NEPA documents as projects are proposed. For example, use and application of forest management chemicals is being addressed through the Regional FEIS on Vegetation Management. Use of a chemical in a mineral recovery process located on Forest would be addressed through a site-specific NEPA analysis of the proposed mining project.

116 MANY REVIEWERS EXPRESSED CONCERN OVER THE EFFECTS OF PROPOSED MANAGEMENT ACTIVITIES ON WATER QUANTITY AND QUESTIONED THE ADEQUACY OF THE ANALYSIS IN THE DEIS OF ENVIRONMENTAL CONSEQUENCES ON WATER YIELD AND TIMING OF FLOW.

COMMENTS INCLUDED:

“A second important issue in the Yakima Valley is water management. You point out very well that timber harvest can be used to temporarily increase water yield. It should be pointed out that *nothing* can be done in non-harvest areas (particularly wilderness) to assist water yield so necessary to the agricultural industry. No mention is made of how forest management fits in with the Yakima Basin Enhancement Plan.”

“We are particularly concerned about the impacts of harvest activities on water yields. Your analysis looks at water yields on a forest-wide basis. We feel there must be analysis performed on a sub-basins where cumulative impacts have a high likelihood. In addition, we feel that mean annual yield has no real meaning. The concerns are high peak flows, which act to destabilize stream channels, and reduction in summer low flows.”

“Varying levels of increased water yield have been calculated for each alternative based on timber harvest, but they do not appear to be correlated to anything. What will be the effect on channel stability, sedimentation loads, and instream uses? In what drainages will these increases have positive impacts and in what drainages will they have negative impacts?”

“We are concerned that increased runoff would likely occur during peak flows, when it is less useful and brings greater risk of stream scouring. Throughout your document, runoff seems to be treated as a benefit, though it may well be highly impacting.”

“Water yield projections predict increased yield with increases in intensive timber management. However the discussion does not adequately address the matter of timing and distribution of runoff. We are concerned that the proposed extensive clearcutting will result in runoff occurring in high flow peaks during the early spring...Changes in runoff distribution and timing may result in hidden costs. Additional water storage may be necessary. County residents using small tributaries for agricultural purposes may find these water sources drying up earlier than usual.”

“The Draft Plan’s assertion that timber harvest in roadless areas will increase runoff to the benefit of irrigation and domestic users is a transparent lie. Increased runoff will occur, but as winter and spring floods that will be followed by water shortages in the summer months. The Draft Plan misunderstands the basic biologic relationship of undisturbed watersheds and water quality.”

“A great deal of emphasis is put upon the value of these trees to the timber industry. But equal emphasis should be placed on the value of these forests, left standing, to another equally important Washington industry, the farmers and orchardists. Old growth forests help maintain adequate summer flows for irrigation and provide flood control in spring. Protection of these watersheds should also be given adequate consideration in the Final Forest Plan.”

FOREST SERVICE RESPONSE:

Protection of water resources is a primary responsibility of the USDA-Forest Service. In this regard, maintenance of water quality and a favorable streamflow regime are the highest priority goals. Direct augmentation of streamflows is not a primary goal of the Forest Service. Increases in water quantity may result from some forest management activities; however, concerned over the protection of water quality and streamflow regime, The Forest Management Team reviewed the DEIS treatment of water quality, water quantity and timing of flow in light of the public responses. The Team decided that a more detailed, drainage-by-drainage analysis of water yield would not be conducted at the Forest Plan level and that no related changes to alternatives or allocations were warranted at this time. Normally, streamflows within the National Forest Boundary are sufficient to maintain channel condition, and also to provide adequate flows for both resident and anadromous fish, provided that: (1) Best Management Practices are followed, (2) timber harvest in riparian areas on National Forest lands is done over long periods of time with an extended rotations approach, and (3) that cumulative effects are analyzed prior to implementing timber sale activities in drainages in which they are identified as an issue. Irrigation reservoirs tend to negate seasonal fluctuations in water flow.

However, several changes have been made in the final documents that either directly or indirectly address concerns over the water yield issue. FEIS Chapter IV includes a more detailed disclosure of the potential effects of forest management activities on water yield and timing of flows. The Forest Plan now includes a formalized set of general Best Management Practices designed to be refined and applied at the project level. Forest-wide Standards and Guidelines for Riparian Area Management have been developed to clarify the Forest's management direction for these sensitive areas. The monitoring guidance in Chapter V of the Forest Plan has been improved to better define the Forest's monitoring strategy for the major watershed issues. Between the Draft and Final, a more site specific analysis was conducted on more than 30 sub-drainages in which cumulative effects of management activities on soil and water resources was a concern. Harvest was rescheduled in a number of drainages because of a high risk of downstream impacts which could result from cumulative effects of present and predicted management activities both on private and federal lands.

The potential for forest management activities to effect the quantity and timing of flows is recognized. On the small scale, numerous research and administrative studies have been completed on small watersheds (generally less than 100 acres) in which streamflow has been evaluated both before and after timber harvest. The general conclusion is that temporary on-site increases in annual and summer flows normally occur. Effects on peak flows are inconclusive. Increases in annual and low flows are greatest in moist environments and least in arid areas. While initial on-site increases may be substantial, they are generally too small (less than 5%) to be measurable in larger watersheds downstream, where only one to two percent of the area is harvested annually. This is due to vegetation regrowth in harvested areas.

On the large scale, concern exists for the potential cumulative effect of management activities on water yield from the following standpoints: (1) quantity of flow available through augmentation and storage, (2) channel stability impacts from variations in peak flows, (3) maintenance of low flows for channel maintenance and fish habitat, and (4) maintenance of low flows for irrigation. These issues are affected by a large number of interrelated factors such as annual and long-term trends in precipitation, evapotranspiration, groundwater movement, stream channel and riparian conditions, irrigation withdrawals, storage facilities, and water conservation efforts. The Forest Service is only one of the many entities involved in this scale of water resource management. The Forest will fulfill its role in this system through more site specific analysis of the cumulative effects issue at the area and project levels of planning. However, the responsibility for basin wide management of the water resource is shared by all entities.

117 MANY REVIEWERS EXPRESSED CONCERN OVER THE LEVEL OF RESOURCE DATA AVAILABLE ON THE FOREST FROM WHICH TO MAKE MANAGEMENT DECISIONS. IN ADDITION, REVIEWERS REQUESTED THAT A STRATEGY FOR OBTAINING NEEDED INFORMATION BE DISPLAYED IN THE FINAL DOCUMENTS.

COMMENTS INCLUDED:

“The Draft Forest Plan contains an inadequate data base relating to water quality and fisheries. This data base should be available when you choose an alternative. Otherwise, you merely ‘plan to plan’ which is not the intent of NFMA.”

“A process for collection of adequate baseline data in conjunction with project planning should be specifically proposed, so that the next plan will have an appropriate information base.”

“What specific studies have been carried out on the WNF with regards to the contribution of snowpack melt, especially on south facing slopes where clearcut units have increased solar radiation absorption? If no studies have been done, how can the DEIS claim that ‘...this effect is not thought to be significant on the major river basins.’”

FOREST SERVICE RESPONSE:

The environmental consequences of the various alternatives on water resources in both the Draft and Final documents were estimated using available information, professional judgement and local knowledge. The Forest recognizes that the risk associated with management decisions increases for those resources that lack a fully developed data base. The Forest Plan provides direction for both monitoring resource conditions during implementation in response to this risk and for collecting additional information needed to improve future management decisions.

The monitoring guidance in Forest Plan Chapter V has been up-dated. The sections on monitoring soil, water and fish habitat have been improved to better display the Forest’s monitoring strategy for these resources. This guidance provides a framework for developing a Watershed and Fisheries Habitat Monitoring Plan in coordination with State Fish and Water Quality agencies, the Tribes and other interested parties. The monitoring activities identified in this plan will be directed at the most sensitive issues and areas in response to the risk associated with management decisions.

The Information Needs section of the Forest Plan, Chapter II, identifies the major areas in which administrative and/or research effort is needed to fill information gaps. An accelerated stream inventory program began in 1989, with the goal of surveying all fish-bearing streams within 3-5 years. In addition, the Forest is actively pursuing opportunities to work with the research community in filling information needs, such as those identified for the refinement of riparian management standards.

118 MANY REVIEWERS CONSIDERED THE MONITORING GUIDANCE IN THE DRAFT PLAN INADEQUATE AND REQUESTED THAT THE FINAL INCLUDE A BETTER DISPLAY OF THE MONITORING STRATEGY FOR THE FOREST.

COMMENTS INCLUDED:

“The Final Plan should clearly outline how monitoring will be carried out such that mid-course corrections can be made in Forest management.”

“The water monitoring element is the key component of the monitoring plan. This element of the monitoring plan should contain the general policies and procedures upon which the more detailed WNF water quality monitoring plan is based. The emphasis of water quality monitoring should be focused in sensitive or high hazard areas, rather than randomly monitoring 10 percent of the management activities. Monitoring should also focus on the protection of beneficial water uses as identified in the water quality standards for the state of Washington.”

“The water quality monitoring plan does not have enough detail to evaluate it.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0579, 0830, 0860, 2026, 2201, 2941, 3134, 3187, 3255, 3270, 3365, 3638, 4269, 4432, 4485, 4495, 4498

FOREST SERVICE RESPONSE:

The guidance for monitoring soil, water and fish habitat resources in Forest Plan Chapter V has been revised and improved significantly. The goal of these revisions was to better display the monitoring strategy on the Forest for these critical resources. Forest Plan Appendix F includes worksheets that identify the monitoring strategy needed to address the major issues associated with soil, water and fish habitat resources. Information from these worksheets was then used to update the Monitoring Table in Chapter V.

The Forest Plan monitoring guidance provides a framework for developing a coordinated Watershed/ Fish Habitat Monitoring Plan in cooperation with State Fish and Water Quality agencies, the Tribes and other interested parties. The monitoring activities identified in this annually updated plan will be directed at the most sensitive issues and areas in response to the risk associated with management decisions. Plan guidance outlines the major components of the Forest monitoring program including long-term trend monitoring and monitoring the effectiveness of practices and projects.

A major component of the monitoring program will be the evaluation of the application and effectiveness of on-site management practices. Nearly all activities would have a basic level of implementation monitoring through timber sale and contract administrators. A sub-sample of activities will be subject to closer evaluation by individual or groups of other resource specialists. For example, on-site monitoring of slope conditions will be conducted to evaluate the effectiveness of practices in meeting objectives for

the protection of soil productivity. Instream monitoring will emphasize evaluation of reaches within or immediately downstream from projects, rather than committing all efforts to locations far downstream from the point of disturbance. Approved techniques will be employed to assess on-site and instream effects. The goal is to establish and maintain a monitoring network responsive to the most sensitive issues on the Forest so that the need to modify or terminate individual practices or projects can be identified in an open and timely fashion.

119 SEVERAL REVIEWERS REQUESTED THAT THE FOREST DEVELOP WATER QUALITY STANDARDS FOR EACH WATERSHED.

COMMENTS INCLUDED:

“It is essential to proper management of the Forest’s water resources that the Wenatchee develop a system of drainage by drainage water quality standards that will include a proper assessment and effective mitigation program for the impacts that will result from the roading and cutting that is to be conducted in any given drainage.”

“The Forest Service should develop and implement drainage-by-drainage water quality standards which would maintain high-quality watersheds and fisheries.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

2074, 2125, 3256, 3989, 4432, 4493, 4498

FOREST SERVICE RESPONSE:

The development of water quality standards is the responsibility of the State of Washington (Washington Administrative Code, Chapter 173-201). The USDA-Forest Service does not have the legal authority to establish water quality standards per se. As a Designated Management Agency, the Forest Service serves as a cooperator with the State in meeting the objectives of the Clean Water Act. In regard to the management of non-point water quality, the Forest Service must conduct practices and projects in a manner that insures the long-term protection of beneficial uses at a level that meets or exceeds State requirements.

In fulfilling its role in protecting water quality, the Forest Service can develop specific management objectives for individual drainages. These management objectives would describe a desired future condition for a drainage in regards to a specific beneficial use. A desired future condition narrative for riparian areas that illustrates this process has been added to the Forest Plan, Chapter IV.

On most of the Wenatchee National Forest, watershed objectives will be based on fish habitat as the primary beneficial use. The Forest-wide Standards and Guidelines for fish habitat provide direction for developing fish habitat management objectives for sub-drainages in cooperation with water quality and fisheries agencies, the Tribes and other entities. This will be accomplished as inventory and monitoring data are obtained for watershed and riparian habitat conditions in drainages on the Forest. Forest-wide Standards and Guidelines for riparian areas provide guidance for planning and interim standards designed to initiate the process of establishing management objectives by sub-drainage.

120 MANY REVIEWERS REQUESTED THAT THE FEIS INCLUDE DETAILED ANALYSIS OF IMPACTS TO WATER RESOURCES ON A SITE-SPECIFIC OR DRAINAGE BASIS.

COMMENTS INCLUDED:

“The consequences of increased water yield needs to be evaluated on a site-specific basis.”

“Site specific project analysis and ‘Best Management Practice Guidelines’ (DEIS III-76) are indeed essential at the ‘micro-management’ level, but are not enough to make up for fundamental deficiencies at the ‘macro-management’, or comprehensive level of the Forest Plan.”

“The Irrigation Districts need specific information as to how the dynamics of the existing hydrologic pattern will be affected both in the short and long term. We are particularly concerned about the net change in discharge magnitude over time and space between existing conditions and conditions per proposed plan.”

“Because approximately 47% of the WNF lies within the Yakima River watershed, a more complete analysis on the Yakima River Basin is needed than is presented on pages III 52-54.”

“Please provide an additional listing showing each sub-watershed, its current water yield, the acreage breakdown between FORWET and FORDRY, and the projected water yield under the proposed alternative for the first, fifth and fifteenth decades.”

“The Forest Service must estimate the flows of major streams on a weekly basis or at least a biweekly basis throughout the year for each of the alternatives.”

“Data presented in the Forest Plan and DEIS provides information on sedimentation levels for the entire Forest and not for specific watersheds. Such data presentation masks what sedimentation levels will occur in specific watersheds as the result of the Plan... The Forest Service must more thoroughly identify and discuss these problem areas, and it must thoroughly evaluate how resources on specific watersheds will be impacted as a result of its proposed plan.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0043, 2125, 2201, 3256, 3323, 4016, 4186, 4298, 4354, 4493, 4495, 4498

FOREST SERVICE RESPONSE:

The Forest Plan and accompanying FEIS serve to document the selection of land allocations and provide broad or general direction for more site-specific planning. The Forest Management Team considered the level of detail in the FEIS adequate to make a reasoned decision among alternative land allocations for this level of planning. As the Forest Plan is implemented, the Forest-wide Standards and Guidelines in Chapter IV provide direction for more detailed analysis and planning at the area and project levels. Refer to the response to comment 116 for additional information on the analysis issue.

121 SEVERAL REVIEWERS CHALLENGED THE RELEVANCY OF THE SEDIMENT YIELD ESTIMATES IN THE DEIS BASED ON THE FACT THAT NO LINK HAS BEEN MADE ON THE FOREST BETWEEN ACCELERATED SEDIMENTATION AND IMPACTS TO FISH HABITAT.

COMMENTS INCLUDED:

“However, the specific [sediment] methodology questions will remain irrelevant unless the Plan develops a quantitative technical link between sedimentation and salmon production.”

“Has any modeling been done for sediment impact on resident and anadromous fish? Models are available from other Forests.”

“Table B-VIII-1 begins to unveil the primary problem in the Draft Plan. Water yields and sediment are really only indices, the former by the plan’s own definition. The anadromous fish commercial harvest shows only a very slight difference between nine alternatives, ranging from 63 to 66 thousand pounds. Alternative E shows the highest level, but this is not linked in any manner to its lowest index value for both increased water yield and sediment.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0152, 0580, 0582, 2131, 2854, 2888, 2901, 2968, 2993, 3015, 3210, 3233, 3255, 3256, 3550, 3621, 3949, 4019, 4094, 4143, 4294, 4455, 4495, 9018

FOREST SERVICE RESPONSE:

The delivered sediment values displayed in Chapter IV of the FEIS are indices used to make relative comparisons between alternatives. A sediment modeling process had to be utilized in order to estimate the impacts of a large number of activities programmed through the analysis period (see Wenatchee NF Delivered Sediment Coefficients, Feb. 1985 - P.D. McColley). For more details regarding sediment modeling in the Forest Plan, please refer to the related response in the soils section.

A quantitative relationship between sediment delivery and fish habitat potential has not been established on the Wenatchee National Forest. The environmental consequences section in the FEIS utilizes the assumption that as development within a watershed increases, the risk of new sediment deposition in fish habitat also increases. This relationship is one of the major items addressed by the monitoring and accelerated stream inventory programs outlined in Chapter V and Appendix A of the Forest Plan. The accelerated stream inventory program began in June, 1989.

122 SEVERAL REVIEWERS EXPRESSED CONCERN OVER THE PROTECTION OF WATER QUALITY IN DOMERIE CREEK, THE MUNICIPAL SUPPLY WATERSHED FOR THE CITY OF ROSLYN.

COMMENTS INCLUDED:

“New amendments to the Safe Drinking Water Act will probably require filtration of surface water supplies. Water filtration plants are quite expensive and the costs go up as water quality goes down. Yet how can we begin to plan or design anything until we know the amount of pollution the USFS will be causing in Domerie Creek through upstream activities. Any supposed balance of net public benefits must include all negative effects.”

“We hereby register our opposition to road-building and logging within the area. While negotiations between the City of Roslyn and the USFS for a mutually acceptable plan for the watershed have not been concluded, this plan and its total failure to consider the City’s interest raise new questions about whether we can have confidence in the USFS to take water quality into consideration and to live up to any plan in which this is a major factor.”

“The Forest Service land in the Domerie Creek drainage was designated ‘General Forest’ under the Alpine Lakes Plan. It was and is our opinion that this is an inappropriate designation for a municipal watershed, especially one as small as Domerie Creek.”

“I find it amazing how the Federal government through the EPA and the Clean Water Act can place demands upon municipalities such as the City of Roslyn to maintain high standards for its drinking water and yet on the other hand allow the USFS to completely undo what Congress had intended to obviate with the Clean Water Act.”

“Allocating this area [Domerie Creek] to GF is nothing but fog. We all know we will never achieve yields off this sensitive piece of land, and to leave it in the timber production areas artificially maintains a higher harvest level than possible given the true management objectives.”

“We the undersigned residents of Roslyn and area, object to your proposal to cut timber on the Roslyn watershed. It cannot help but affect our water supply, and the money gained thereby cannot ever replace the natural conditions necessary for a watershed to function.”

LETTERS WITH COMMENTS ON THIS SUBJECT INCLUDE:

0878, 0900, 2125, 2910, 2931, 3391, 4433

FOREST SERVICE RESPONSE:

Between the Draft and Final a Forest-wide Standard and Guideline for municipal watersheds was developed to provide management direction (refer to Chapter IV of the Forest Plan).

In the Preferred Alternative, National Forest lands in Domerie Creek have been allocated to the OG-1 prescription (Old-Growth Management-Dedicated). Lands under this prescription are managed for the benefit of wildlife species dependent upon old-growth habitat. In the case of Domerie Creek, National Forest lands have been designated a Spotted Owl Habitat Area. No timber harvest or related activities are scheduled on National forest lands in this watershed under the Forest Plan. Under this prescription, no significant water quality impacts are expected to occur as a result of Forest Service activities on Domerie Creek.

Timber harvest and related road construction could still occur on the private timber lands in the Domerie Creek drainage. The Forest Service has no control over management activities on private timber lands within the Forest boundary. Under the OG-1 prescription, a collector road could be constructed across National Forest lands in order to access isolated private property. Such an easement proposal would be made by the property owner. A site-specific environmental analysis would then be conducted by the Forest Service to evaluate the consequences of the access proposal.
