

To Filter Results for the Stream Temperature Monitoring Sites

Choose View/Filter from the menu along the top

Use the drop down box on the left to choose the attribute to filter, the middle dropdown to choose an operator and the last box to enter how you would like them filtered. The field will auto-complete based on the available point attributes.

Click the "Apply" button when finished with the filter. Only those filtered points will be shown and only those stream temperature locations will be exported in either table or KML format.

In the example above, the points shown will be those within the state of Idaho

You can clear or modify the filter as desired.

General Tips

To export as a table, choose File/Export

To export as a KML file, choose the Export to KML link along the top of the map

To change the view from table to map format, choose Visualize from the dropdown menu at the top and choose either "Table" or "Map". Any filters applied will be applied to each view and each file export.
