Section 404—Major Cold Asphalt Concrete Pavement

Description

404.01 Work. Construct one or more courses of cold asphalt concrete pavement on a prepared surface that has been approved in writing by the CO.

Cold asphalt concrete pavement grade is designated as shown in table 703-5 or table 703-6.

Cutback asphalt grade is designated as shown in AASHTO M 81, AASHTO M 82, or ASTM D 2026. Emulsified asphalt grade is designated as shown in AASHTO M 140 or M 208.

A prepaving conference will be held at least 10 working days prior to the beginning of paving operations. At that time, the Contractor and the CO will discuss methods of accomplishing all phases of the paving work, including laydown operations, work schedules, work force, quality control systems, spill prevention and contingency plans, and asphalt concrete mix delivery.

Materials

404.02 Requirements. Ensure that the material conforms to specifications in the following subsections:

- Antistrip Additive ............................................................... 702.07
- Cement ............................................................................... 701.01
- Choker Aggregate ............................................................... 703.11
- Cold Asphalt Concrete Pavement Aggregate ...................... 703.08
- Cutback Asphalt ................................................................. 702.02
- Emulsified Asphalt ............................................................. 702.03
- Hydrated Lime .................................................................... 725.03
- Mineral Filler ...................................................................... 725.05
- Water .................................................................................. 725.01

Ensure that mixing temperature meets the requirements specified in Subsection 702.04.

Construction

404.03 Composition of Mixture (Job-Mix Formula). Ensure that the composition of cold asphalt concrete mixtures conforms to the following:
(a) Furnish a job-mix formula at least 21 days prior to production. Base the formula on a mix design using the type and grade of asphalt material that will be furnished for the project and of aggregate that will be produced for the project. Acceptable job-mix procedures and criteria are found in AI Manual Series number 14 and number 19. After reviewing the Contractor’s proposed job-mix formula, the CO will determine a job-mix formula with TV’s and will notify the Contractor in writing.

(b) In the proposed job-mix formula, include definite single-value TV’s for:

1. The percentage of aggregate passing each specified sieve, based on the dry weight of aggregate. These percentages shall be within the range shown in Subsection 703.08, table 703-5 or table 703-6, as applicable.

2. The percentage of bituminous material to be added, based on the total weight of mixture and corresponding residual asphalt content.

3. The kind and percentages of additives to be used.

4. The percentage of water, based on the total dry weight of the mixture.

5. For emulsified asphalt only, the percentage to total fluids at compaction, based on the total dry weight of the mixture.

404.04 Performance. Perform construction in accordance with the following:

(a) Mixing Plant. Use asphalt mixing plants or pugmills that:

1. Are manufactured for that purpose.

2. Are in good working order.

3. Are equipped with weighing or volumetric equipment capable of providing accurate control of the material entering the mixer.

4. Interlock the aggregate feed controls with the asphalt material and other additives.

(b) Pavers. Use pavers that are:

1. Self-contained, power-propelled units with adjustable vibratory screeds with full-width screw augers.

2. Capable of spreading and finishing courses of asphalt mixture in widths at least 300 mm more than the width of one lane.
(3) Equipped with a receiving hopper with sufficient capacity to ensure a uniform spreading operation.

(4) Equipped with automatic feed controls that are properly adjusted to maintain a uniform depth of material ahead of the screed.

(5) Capable of being operated at forward speeds consistent with satisfactory laying of the mixture.

(6) Capable of producing a finished surface of the required smoothness and texture without segregating, tearing, shoving, or gouging the mixture.

(7) Equipped with automatic screed controls with sensors capable of sensing grade from an outside reference line, sensing the transverse slope of the screed, and providing the automatic signals that operate the screed to maintain grade and transverse slope.

(c) Surface Preparation. Prepare the surface in accordance with Sections 304, 306, 307, and 308, as applicable. Apply an asphalt tack coat to contact surfaces of curbing, gutters, manholes, and other structures in accordance with Section 407.

(d) Weather Limitations. Place cold asphalt concrete pavement on unfrozen, reasonably dry surface when the temperature of the road surface, in the shade, is above 15 °C, and it is not raining or snowing, or predicted to rain or snow within 24 hours after placement.

(e) Mixing. Introduce the material into the mixing plant according to the approved job-mix formula. Control the moisture content by adding water in the plant, covering the stockpile, drying the aggregate, or a combination of these methods as necessary to comply with the job-mix formula. When approved in writing by the CO, additives such as lime or cement may be incorporated into the mixture to correct moisture content.

When the aggregate is combined with asphalt materials other than emulsified asphalt, ensure that the aggregate does not contain more than 3 percent moisture and is at a temperature not less than 16 °C and not more than 107 °C. When the aggregate is combined with emulsified asphalt, ensure that the aggregate is at a temperature not less than 16 °C and not more than 79 °C. Determine the mixing time for each phase of the mixing operation from the nature of the aggregates, the job-mix formula, and the size of the batch. If the mixture is stockpiled, do not allow the pile to segregate such that the emulsified asphalt breaks.

(f) Hauling. Use vehicles conforming to Subsection 402.11.

(g) Placing & Finishing. Do not use mixtures produced from different plants unless the mixtures are produced in accordance with the same job-mix formula, use material from the same sources, and are approved.
Place the mixture with a paver that conforms to Subsection 404.04(b). Control horizontal alignment using a reference line. Automatically control the grade and slope from reference lines, a ski and slope control device, or dual skis. Use skis with a minimum length of 6 m.

Offset and locate longitudinal joint according to Subsection 402.12.

For dense-graded mixtures, allow the surface to cure for not less than 10 days, and for open-graded mixtures, not less than 4 days, before covering with the next course. During this period, maintain the surface and keep it free of corrugations. Use an approved material to patch all holes. Remove all excess blotter, dirt, or other objectionable substances before placing the following course or treatment.

(h) Compacting. Perform initial compaction through a minimum of three complete coverages with a steel-wheel roller that meets the requirements of Subsection 203.15(b). If necessary for dense-graded mixtures, aerate the material by periodically moving and exposing it in the stockpile or through manipulation in a windrow to remove excess moisture or cutter. When DESIGNATED IN THE SCHEDULE OF ITEMS, and prior to intermediate rolling, apply choker aggregate to the top layer only using aggregate spreading equipment designed for the controlled spreading of fine material. Uniformly spread the material to a depth that, when compacted, is sufficient to fill the voids of the asphalt concrete mat. Remove excess choker material by brooming.

Perform intermediate compaction through a minimum of two complete coverages of a self-propelled pneumatic-tire roller with a maximum tire pressure of 275 kPa.

Perform final compaction through two complete coverages with a static roller that meets the requirements of Subsection 203.15, and until all roller marks are eliminated. For open-graded mixtures, use a steel-wheel roller. When no choker aggregate is required, perform final compaction while the emulsion is still tacky.

Along forms, curbs, headers, walls, and other places not accessible to the rollers, use other equipment to obtain the minimum compaction of the mixture.

404.05 Acceptance Sampling & Testing. Perform acceptance sampling and testing in accordance with Subsections 402.15 through 402.18, with the following modifications:

(a) Use table 404-1.

(b) Use table 404-2.

a. For sieve size tolerance, refer to table 703-5 or 703-6, according to the grading DESIGNATED IN THE SCHEDULE OF ITEMS.

(c) Compaction for the lot will be accepted if the requirements specified in Subsection 404.04(g) have been met and all roller marks are eliminated.

Measurement

**404.06 Method.** Use the method of measurement that is DESIGNATED IN THE SCHEDULE OF ITEMS.

Calculate tonnage as the weight used in the accepted pavement. Make no deduction for the weight of bituminous material or water. No separate payment will be made for water or additives used in the mixture.

Payment

**404.07 Basis.** The accepted quantities will be paid for at the contract unit price for each PAY ITEM DESIGNATED IN THE SCHEDULE OF ITEMS, except that payment for sampling and testing will be made as follows:

(a) Twenty-five percent of the lump sum, not to exceed 0.5 percent of the original contract amount, will be paid after all the testing facilities are in place, qualified sampling and testing personnel are identified, and the work being tested has started.

(b) Payment for the remaining portion of the lump sum will be prorated based on the total work completed.

(c) Payment for all or part of this pay item may be withheld if the Government assurance tests invalidate the Contractor’s testing.

Payment will be made under:

Section 405—Minor Cold Asphalt Concrete Pavement

Description

405.01 Work. Construct one or more courses of cold asphalt concrete plant mix on a prepared surface as SHOWN ON THE DRAWINGS. Have the surface approved by the CO in writing prior to placing cold asphalt concrete plant mix.

Cutback asphalt grade is designated as shown in AASHTO M 81 or M 82. Emulsified asphalt grade is designated as shown in AASHTO M 140 or M 208.

Materials

405.02 Asphalt Material. Ensure that asphalt material meets the requirements specified in Subsection 702.02 or 702.03, as applicable. The exact percent of asphalt material and the grade to be used will be furnished by the CO after requirements in Subsection 405.05 have been reviewed and evaluated. Ensure that mixing temperatures shall meet the requirements specified in Subsection 702.04.

405.03 Aggregate. Ensure that aggregate meets the requirements specified in Subsection 703.09, except for aggregate gradation. Maximum gradation size or suggested gradation designations will be SHOWN ON THE DRAWINGS.

405.04 Additives. Additives, such as filler, hydrated lime, and antistrip agents, may be used as necessary to meet specifications. Ensure that filler meets the requirements of AASHTO M 17; hydrated lime meets the requirements of AASHTO M 216, type N; antistrip materials meet the requirements specified in Subsection 702.07; and choker aggregate meets the requirements specified in Subsection 703.11.

405.05 Job-Mix Formula. Submit a job-mix formula and supporting documentation, test results, and calculations for the material to be incorporated into the work. Include copies of laboratory test results and mix design data that demonstrate that the properties of the aggregate, additives, and mixture meet those requirements and criteria of local public agencies or the AI. After reviewing the Contractor’s proposed job-mix formula, the CO will determine the final values for the job-mix formula to be used and notify the Contractor in writing.

Construction

405.06 Asphalt Concrete Mixing Plant. Ensure that plants used for preparing cold asphalt concrete mixtures are manufactured for that purpose, in good repair, and capable of mixing the material to a uniform consistency.
405.07 **Hauling Equipment.** Ensure that trucks used for hauling asphalt concrete mixtures have tight, clean, smooth metal beds that have been thinly coated with a material to prevent the mixture from adhering to the beds. Do not use petroleum derivatives or other coating material that contaminates or alters the characteristics of the mixture. Drain truck beds prior to loading, and ensure that each truck has a cover to protect the mixture from weather. When necessary to ensure that the mixture will be delivered at the specified temperature, ensure that truck beds are insulated and covers securely fastened.

405.08 **Pavers.** Use pavers that are in good working order and have an adjustable vibrating screed or strike-off assembly, and an auger ahead of the screed to distribute the mixture. Use pavers that are capable of spreading and finishing courses of asphalt concrete plant mix material in the lane widths and thickness SHOWN ON THE DRAWINGS. Unless otherwise SHOWN ON THE DRAWINGS, towed-type pavers and Layton-type pavers or graders may be used to place and spread the asphalt concrete plant mix material.

405.09 **Rollers.** Ensure that all rollers meet the requirements specified in Subsections 203.15(b), (c), and (d). Where it is impractical to operate larger rollers, 3- to 5-t rollers may be used. On walkways, 1-t rollers may be used.

405.10 **Weather Limitations.** Do not place the asphalt concrete mixture when the base course is frozen, when the average temperature of the underlying surface upon which the asphalt concrete mixture is to be placed is less than 10 °C in the shade, or when it is raining or snowing, or predicted to rain or snow within 24 hours after placement.

405.11 **Conditioning of Existing Surface.** Immediately before placing the asphalt concrete mixture, clean the existing surface of loose or deleterious material. Before placing the asphalt concrete mixture, paint the contact surfaces of curbing, gutters, manholes, and other structures with a thin, uniform coating of asphalt material.

405.12 **Control of Asphalt Concrete Mixture.** Supply a certification from the mixing plant stating that the mix conforms to the approved job-mix formula. The CO may reject any batch, load, or section of roadway that appears defective in gradation, asphalt content, or moisture content. Do not incorporate material rejected before placement into the pavement. Remove any rejected section of roadway. No payment will be made for the rejected materials or the removal of the materials, unless the Contractor requests that the rejected material be tested, at the Contractor’s expense, under the following provisions:

(a) Obtain three representative samples and have them tested at a laboratory approved by the CO.
(b) If test results show that the material conforms to the tolerance shown in table 405-1, payment will be made for the material and for its removal and testing.

### 405.13 Transporting, Spreading, & Finishing

Transport the mixture from the mixing plant to the point of use in vehicles that meet the requirements specified in Subsection 405.07.

Spread the mixture and strike it off to the grade and elevation established. Provide a maximum compacted lift thickness of 100 mm unless otherwise shown on the drawings.

Ensure that the longitudinal joint in any layer offsets that in the layer immediately below by approximately 150 mm. Where laydown requires placement of two adjacent panels to cover the surface of a traveled way, ensure that the longitudinal joint of the top layer is at the centerline. This requirement does not apply to turnouts, extra widening, or parking areas. Offset transverse joints in succeeding layers and in adjacent lanes at least 3 m.

On areas where irregularities or unavoidable obstacles make the use of mechanical spreading and finishing equipment impracticable, the mixture may be placed and finished by using hand tools.

### 405.14 Compaction

Perform compaction with rollers that meet the requirements specified in Subsection 405.09. Perform initial compaction with steel-wheel rollers for a minimum of three complete coverages. Between initial and final rolling on open-graded mixtures, apply a choker aggregate to the top layer only using aggregate spreading equipment designed for the controlled spreading of fine material. Uniformly spread the material to a depth that, when compacted, will be sufficient to fill the surface voids of the bituminous mat. Remove excessive choke material by brooming. Continue rolling, with a minimum of four complete coverages and until no roller tracks remain, and while the bituminous material is still tacky.
Section 405

**Measurement**

**405.15 Method.** Use the method of measurement that is DESIGNATED IN THE SCHEDULE OF ITEMS.

Calculate the quantity of cold asphalt concrete plant mix as the tonnage of combined aggregate and asphalt material used in the accepted work. No separate payment will be made for asphalt material, water, or additives used in the mixture.

**Payment**

**405.16 Basis.** The accepted quantities will be paid for at the contract unit price for each PAY ITEM DESIGNATED IN THE SCHEDULE OF ITEMS.

Payment will be made under:

<table>

</tbody>
</table>
Section 407—Asphalt Tack Coat

Description

407.01 Work. Apply an emulsified asphalt tack coat. Have the surface to be treated approved by the CO in writing prior to treatment.

Tack coat emulsified asphalt grade is designated as shown in AASHTO M 140 or M 208.

Materials

407.02 Requirements. Ensure that material conforms to the specifications in the following subsections:

- Emulsified Asphalt ............................................................. 702.03
- Water .................................................................................. 725.01

Construction

407.03 Equipment. Use equipment that conforms to specifications in Subsection 410.04.

407.04 Surface Preparation. Immediately before the application of the tack coat, patch the surface to be treated and remove all foreign and loose material.

407.05 Weather Limitations. Apply asphalt tack coat on a dry, unfrozen surface when the surface temperature in the shade is above 5 °C and rising.

407.06 Asphalt Application. Where slow-setting emulsified asphalt is used, dilute it by adding an equal amount of water to the emulsified asphalt.

Apply the asphalt in accordance with Subsection 410.08 at a rate of 0.15 to 0.70 L/m². When a tack coat cannot be applied with an asphalt distributor spray bar, apply the tack coat uniformly and completely by fogging with a hand spray attachment or by another approved method. Ensure that the surfaces of adjacent structures and trees are protected from splattering and marring.

If excess asphalt material is applied, squeegee the excess from the surface. Allow the tacked surfaces to completely cure before placing the covering course. Place the covering course within 4 hours of placing the tack coat.
**Section 407**

**407.07 Acceptance.** Emulsified asphalt will be evaluated for acceptance under Subsection 106.05.

Provide the minimum number of samples specified in table 410-4.

**Measurement**

**407.08 Method.** Use the method of measurement that is DESIGNATED IN THE SCHEDULE OF ITEMS.

Water used for diluting emulsified asphalt will not be included in the quantities for PAY ITEMS 407(01) or 407(02), and will not be paid for separately.

**Payment**

**407.09 Basis.** The accepted quantities will be paid for at the contract unit price for each PAY ITEM DESIGNATED IN THE SCHEDULE OF ITEMS.

Payment will be made under:

</tbody>
</table>
Section 408—Asphalt Prime Coat

Description

408.01 Work. Apply a cutback or emulsified asphalt prime coat. Have the surface approved in writing by the CO prior to applying the prime coat.

Prime coat asphalt grade is designated as shown in AASHTO M 140 or M 208 for emulsified asphalt, and AASHTO M 81 or M 82 for cutback asphalt.

Materials

408.02 Requirements. Ensure that material conforms to the specifications in the following subsections:

<table>
<thead>
<tr>
<th>Material</th>
<th>Subsection</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blotter</td>
<td>703.12</td>
</tr>
<tr>
<td>Choker Aggregate</td>

</tr>
<tr>
<td>Emulsified Asphalt</td>
<td>702.03</td>
</tr>
<tr>
<td>Water</td>
<td>725.01</td>
</tr>
</tbody>
</table>

Construction

408.03 Equipment. Use equipment that conforms to Subsection 410.04.

408.04 Surface Preparation. Immediately before applying the prime coat, lightly blade the surface and roll it with a smooth-wheel roller. Ensure that the moisture content of the top 25 mm of the surface to be treated is slightly damp.

408.05 Weather Limitations. Apply prime coat when the air temperature in the shade and the pavement surface temperature are at least 10 °C and rising, and when the weather is not foggy or rainy.

408.06 Asphalt Application. When required by the CO, lightly spray the surface with water before applying the prime coat. In order to obtain optimum penetration, apply cutback asphalt in accordance with Subsection 410.08 at a rate of 0.45 to 2.25 L/m².

Where using an emulsified asphalt that is not formulated as a penetrating prime coat material, dampen the roadway surface and scarify 25 to 50 mm deep. Dilute the emulsified asphalt by adding an equal amount of water. Apply the diluted emulsified asphalt in accordance with the Subsection 410.08 at a rate of 0.45 to 1.35 L/m². Immediately process, respread, and compact the material.
Cure surfaces primed with emulsified asphalt for not less than 24 hours, and surfaces primed with cutback asphalt for not less than 5 days before covering with the next course.

Until the next course is placed, maintain the primed surface and keep it free of corrugations.

Where traffic is routed over a primed surface before the asphalt material has been completely absorbed, or to minimize damage by rain, spread blotter to cover the unabsorbed asphalt. If an emulsified asphalt is used, use choker aggregate. When cutback asphalt is used, do not apply the blotter material for at least 4 hours following application of the asphalt. Remove all excess blotter, choke, dirt, or other deleterious material and repair all damaged areas before placing the next course. Dispose of asphalt material in accordance with Subsection 202.04(a).

408.07 Acceptance. Cutback asphalt and emulsified asphalt will be evaluated for acceptance under Subsection 106.05.

Blotter will be evaluated for acceptance under Subsection 105.03.

Provide the minimum number of samples and tests specified in table 410-4.

Measurement

408.08 Method. Use the method of measurement that is DESIGNATED IN THE SCHEDULE OF ITEMS.

Water used for diluting emulsified asphalt will not be included in the quantity for PAY ITEMS 408(01) or 408(02) and will not be paid for separately.

Payment

408.09 Basis. The accepted quantities will be paid for at the contract unit price for each PAY ITEM DESIGNATED IN THE SCHEDULE OF ITEMS.

Payment will made under:

Section 409—Slurry Seal

Description

409.01 Work. Apply an asphalt slurry seal mixture. Have the surface approved by the CO in writing prior to placing the slurry seal.

Slurry seal type is designated as shown in table 703-8.

Materials

409.02 Requirements. Ensure that material conforms to the specifications in the following subsections:

- Emulsified Asphalt ............................................................. 702.03(d)
- Mineral Filler ...................................................................... 725.05
- Slurry Seal Aggregate ......................................................... 703.10
- Water .................................................................................. 725.01

Construction

409.03 Composition of Mixture (Job-Mix Formula). Furnish a slurry seal mixture of aggregate, water, emulsified asphalt, and additives in accordance with ASTM D 3910 and ISSA T 114. Ensure that the mixture meets the applicable aggregate gradation shown in table 703-8 and has the following residual asphalt contents, based upon weight of dry aggregate:

- Type I—Residual asphalt between 10.0 percent and 16.0 percent.
- Type II—Residual asphalt between 7.5 percent and 13.5 percent.
- Type III—Residual asphalt between 6.5 percent and 12.0 percent.

Submit a written job-mix formula for approval at least 21 days before production that includes the following:

(a) Aggregate Gradation Values. Provide the representative value for each sieve size for the aggregate blend.

(b) Emulsified Asphalt Content. Provide the residual asphalt content, as a percent by weight of dry aggregate.
(c) **Samples.** Provide samples of the aggregate, emulsified asphalt, and mineral filler when SHOWN ON THE DRAWINGS.

(d) **Laboratory Test Reports & Mix Design Data.** Provide copies of all laboratory test reports and mix design data verifying that the material meets the requirements of Subsection 409.02 and the job-mix formula.

The job-mix formula will be evaluated and approved in accordance with Subsection 401.03.

**409.04 Equipment.** Furnish equipment with the following capabilities:

(a) **Slurry Seal Mixer.** Furnish a slurry seal mixer with the following features and capabilities:

1. Self-propelled.
2. Continuous-flow mixing.
3. Calibrated controls.
4. Easily readable metering devices that accurately measure all raw material before entering the pugmill.
5. Automated system for sequencing in all raw material to ensure constant slurry mixture.
6. Mixing chamber to thoroughly blend all ingredients together.
7. Fines feeder with an accurate metering device for introducing additive into the mixer, where the aggregate is introduced into the mixer.
8. A pressurized water system with a fog-type spray bar capable of fogging the surface immediately ahead of the spreading equipment at a rate of 0.13 to 0.27 L/m².
9. Proportioning system that is accurate for measuring all material independent of the engine speed.
10. Minimum speed of 20 m/min and maximum speed of 55 m/min.
11. Minimum storage capacity of 6 t.
(b) **Mechanical-Type Single Squeegee Spreader Box.** Furnish with the following capabilities:

1. Attaches to the slurry seal mixer.
2. Flexible squeegee in contact with the surface to prevent loss of slurry.
3. Adjustable to assure a uniform spread over varying grades and crowns.
4. Adjustable in width with a flexible strike-off.
5. Augers for uniform flow to edges.

(c) **Auxiliary Equipment.** Furnish hand squeegees, shovels, and other equipment necessary to perform the work. Provide cleaning equipment that includes, but is not limited to, power brooms, air compressors, water-flushing equipment, and hand brooms for surface preparation.

(d) **Pneumatic-Tire Roller.** When SHOWN ON THE DRAWINGS, provide a pneumatic-tire roller with the following features:

1. Smooth tread tires of equal size.
2. Minimum ground pressure of tire greater than 345 kPa.

**409.05 Surface Preparation.** Immediately before placing the slurry seal, clean the existing surface of loose or deleterious material.

**409.06 Weather Limitations.** Apply slurry seal when the air temperature in the shade and the surface temperature are at least 15 °C and rising, and when the weather is not foggy, rainy, or overcast.

**409.07 Slurry Seal Application.** Mix the slurry seal using a slurry seal mixer. Fog the surface with water immediately preceding the spreader.

Blend the additive with the aggregate using the fines feeder. Prewet the aggregate in the pugmill immediately before mixing with the emulsified asphalt. Stockpile aggregate accordingly to Subsection 305.04.

Mix the slurry seal for a maximum of 4 minutes. Ensure that the slurry seal mixture is of the desired consistency as it leaves the mixer, and that it conforms to the approved job-mix formula. If approved by the CO, the mineral filler and the emulsified asphalt content may be adjusted during construction to conform to variations in field conditions.
Section 409

Carry sufficient slurry seal mixture in the spreader to completely cover the surface. Spread the mixture with a mechanical-type single squeegee spreader box. In areas not accessible to the spreader box, use hand squeegees to work the slurry seal mixture.

Remove or repair ridges or bumps in the slurry surface.

When required, roll the slurry surface, providing a minimum of five coverages, to completely cure it prior to opening to traffic. Cure is complete when clear water can be pressed out of the slurry mixture with a piece of paper without discoloring the paper.

**409.08 Acceptance.** Emulsified asphalt will be evaluated for acceptance under Subsection 106.05.

Aggregate will be evaluated for acceptance under Subsection 105.03.

Provide the minimum number of samples and tests specified in table 409-1, in accordance with Section 160.

**Measurement**

**409.09 Method.** Use the method of measurement that is DESIGNATED IN THE SCHEDULE OF ITEMS.

**Payment**

**409.10 Basis.** The accepted quantities will be paid for at the contract unit price for each PAY ITEM DESIGNATED IN THE SCHEDULE OF ITEMS.

Payment will be made under:

Section 410—Asphalt Surface Treatment

Description

410.01 Work. Construct a single or multiple asphalt surface treatment course. Have the surface approved by the CO in writing prior to placing the asphalt surface treatment.

Surface treatment aggregate is designated as shown in tables 410-1, 410-2, and 410-3.

<table>
<thead>

</tbody>
</table>

a. See table 703-7 for aggregate gradations.
b. Aggregate weights are for aggregates that have a bulk specific gravity of 2.65, as determined by AASHTO T 84 and T 85. Make proportionate corrections when the aggregate furnished has a bulk specific gravity above 2.75 or below 2.55.

The grade of asphalt is designated as shown in AASHTO M 20 or M 226 for asphalt cement, Subsection 702.03 for emulsified asphalt, and AASHTO M 81 or M 82 for cutback asphalt, or in applicable State department of transportation specifications for the grade specified.

A presurface treatment conference will be held at least 10 working days prior to the beginning of surface treatment operations. At that time, the Contractor and the CO will discuss methods of accomplishing all phases of the work, including operations, work schedules, work force, quality control systems, spill prevention and contingency plans, and material application rates.

Materials

410.02 Requirements. Ensure that material conforms to the specifications in the following subsections:
Table 410-2—Approximate quantities of material for multiple-course surface treatment (using cutback asphalt).

</table>

\(^a\) For asphalt cement spread rates, multiply the asphalt material spread rates shown in the table by 0.68.

\(^b\) See table 703-7 for aggregate gradations.

\(^c\) Aggregate weights are for aggregates that have a bulk specific gravity of 2.65, as determined by AASHTO T 84 and T 85. Make proportionate corrections when the aggregate furnished has a bulk specific gravity above 2.75 or below 2.55.

(c) **Asphalt Temperature.** Ensure that asphalt application temperatures conform to table 702-1.

(d) **Spread Rates.** Furnish proposed spread rates for the asphalt material and aggregate.

410.04 **Equipment.** Ensure that all equipment is in good working order. Furnish the equipment shown below:

(a) **Asphalt Distributor.** Furnish an asphalt distributor with the following features and capabilities:

1. Capable of heating asphalt evenly.

2. Full-circulation spray bar adjustable to at least 4.6 m wide.
(3) Positive controls, including tachometer, pressure gage, volume-measuring device, or calibrated tank, to uniformly deposit asphalt over the full width within 0.08 L/m² of the required rate.

(4) Thermometer for measuring the asphalt temperature in the tank.

(b) **Rotary Power Broom.** Furnish a rotary power broom equipped to control the vertical broom pressure.

(c) **Pneumatic-Tire Rollers.** Furnish a minimum of two pneumatic-tire rollers with the following features and capabilities:

1. Minimum compacting width of 1.5 m.

2. Minimum ground contact pressure of 550 kPa, with all tires exerting equal contact pressure.

3. Gross weight adjustable within the range of 35 to 65 kg/mm of compaction width.

(d) **Aggregate Spreader.** Furnish an aggregate spreader with the following features:

1. Self-propelled.

2. Minimum of four pneumatic tires on two axles.

3. Positive controls to uniformly deposit the aggregate over the full width of asphalt within 10 percent by weight of the required rates.

(e) **Two-Way Communication.** Provide two-way radio communication between the asphalt distributor and aggregate spreader.

(f) **Other Equipment.** When approved, other equipment of proven performance may be used in addition to, or in lieu of, the equipment specified.

**410.05 Surface Preparation.** Immediately before placing any layer of the surface treatment, remove loose dirt and other objectionable material from the existing surface.

Apply surface treatments to an existing asphalt surface only when the surface is dry. Prior to application, allow a newly constructed cold or road mix surface to cure for at
least 21 days for a cutback asphalt mix, and at least 14 days for an emulsified asphalt mix, unless otherwise approved by the CO.

When applying surface treatments to existing aggregate surfaces, ensure that the surface is dry if the aggregate was primed, and slightly damp if not primed. If the aggregate surface is primed, allow a prime coat curing period of at least 5 days for cutback asphalt and 24 hours for emulsions, unless otherwise approved by the CO.

Fog seal patches SHOWN ON THE DRAWINGS or listed in the SPECIAL PROJECT SPECIFICATIONS using CSS–1 emulsion, diluted with an equal part of water, at 0.65 L/m², unless another rate is SHOWN ON THE DRAWINGS.

410.06 Weather Limitations. Apply surface treatments with aggregate only when the ambient air and surface temperatures are above 18 °C and rising, when the weather is not foggy or rainy, and when rain is not forecast for at least 24 hours after application.

Apply fog seals only when the ambient air and surface temperatures are above 10 °C and rising, when the weather is not foggy or rainy, and when rain is not forecast for at least 24 hours after application.

For all work:

(a) Ensure that humidity is less than 75 percent as measured by the sling psychrometer method.

(b) Complete application of the surface treatment 2 hours before sunset.

(c) Unless otherwise approved by the CO, construct fog seals and single-course surface treatments between June 1 and September 1, and multiple-course surface treatments between June 1 and September 15.

410.07 Production Startup Procedures for Surface Treatment. Provide 7 days advance notice before constructing any asphalt surface treatments containing aggregate, and also use these startup procedures when resuming production after termination due to nonconforming work.

Calibrate each asphalt distributor’s bar height, nozzle angle, pump pressure, and longitude and transverse spread rates in accordance with ASTM D 2995. If different asphalt distributors are used throughout the project, calibrate each prior to use on the project.
On the first day of production of each surface treatment layer, whenever there is a change in the surface texture or the aggregate TV’s, construct a 150-m control strip one lane wide. Locate the control strip on the project as designated.

Construct the control strip using material, laydown, and compaction procedures intended for the remainder of the surface treatment. Cease production after construction of the control strip until the material, the control strip, and the asphalt distributor calibration procedures are evaluated and accepted.

Acceptable control strips may remain in place, and will be accepted as a part of the completed surface treatment.

Repeat this control strip process until an acceptable control strip is produced.

410.08 Asphalt Application. Protect the surfaces of nearby objects to prevent spattering or marring. For transverse construction joints, spread building paper on the surface for a sufficient distance from the beginning and end of each application so that the flow through the distributor nozzles may be started and stopped on the paper.

The CO may make adjustments for variations in field conditions. Apply the asphalt uniformly with an asphalt distributor with the spray bar height set for triple overlap. Move the distributor forward at the proper application speed at the time the spray bar is opened. Use care not to apply excess asphalt at the junction of spreads.

Ensure that the length of spread is no more than what can be covered with aggregate within 1 minute of the asphalt application.

Correct skipped areas or deficiencies. Remove and dispose of paper or other material used, in accordance with Subsection 202.04(a).

410.09 Aggregate Application. When using emulsified asphalt, moisten the aggregate to remove its dust coating.

Stockpile aggregate according to Subsections 305.03 and 305.04.

Apply the aggregate uniformly with an aggregate spreader immediately after the asphalt is applied. Operate the aggregate spreader so the asphalt is covered with the aggregate before wheels pass over it. During part-width construction, leave a strip of the sprayed asphalt approximately 150 mm wide uncovered to permit an overlap of the asphalt material.

Immediately correct excesses and deficiencies by brooming, or by the addition or removal of aggregate, until a uniform texture is achieved. Use hand methods in areas not accessible to power equipment.
Make the first roller pass to seat the aggregate immediately after the aggregate is applied. Operate rollers at a maximum speed of 8 km/h. Do not permit the aggregate to be displaced by pickup or sticking of materials to the tire surface. Ensure that the amount of rolling is sufficient to uniformly and thoroughly bond the aggregate over the full width. Make a minimum of three complete coverages. Ensure that rolling is completed within 1 hour after the asphalt is applied to the surface.

410.10 Fog Seal. To construct a fog seal, apply a slow-setting emulsified asphalt diluted with an equal amount of water onto an existing asphalt surface. Apply the diluted emulsified asphalt in accordance with Subsection 410.08 at a rate of 0.45 to 0.70 L/m², depending on the condition of the existing surface. Allow the fog seal to penetrate undisturbed for at least 2 hours, or until the emulsified asphalt breaks and is substantially absorbed into the existing surface. Then lightly cover remaining spots of excess asphalt with blotter before opening the surface to traffic.

410.11 Single-Course Surface Treatment. To construct a single-course surface treatment, apply asphalt onto an existing asphalt surface, immediately followed by a single, uniform application of aggregate. Apply the asphalt and aggregate in accordance with Subsections 410.08 and 410.09 at the approximate rates shown in table 410-1. Determine the exact application rates based on approved control strips. Unless the road is closed to all traffic for the duration of the placement of the surface treatment, use a pilot car to limit traffic speeds. During the initial 45 minutes after rolling, limit the traffic speeds to 15 km/h. Limit traffic speeds to 30 km/h for 24 hours. At all times, operate hauling equipment in a prudent manner and at speeds that will not damage the new surface treatment or create a hazard to the traveling public.

lightly broom the aggregate surface on the morning after construction. Do not displace embedded material.

Maintain the surface for 4 days after the application of the last layer of aggregate by distributing blotter to absorb any free asphalt, by repairing areas deficient in aggregate, and by sweeping excess material from the surface using a rotary power broom. Broom when the air temperature is less than 24 °C. Do not displace embedded material when brooming.

410.12 Multiple-Course Surface Treatment. To construct a multiple-course surface treatment, apply multiple layers of asphalt and aggregate. Apply each asphalt and aggregate layer in accordance with Subsections 410.08 and 410.09, and at the approximate rates shown in table 410-2 or 410-3. Determine the exact application rates based on approved control strips. When approved by the CO, a steel-wheeled roller with a minimum weight of 8 t may be substituted for one of the pneumatic tire rollers.

Maintain the surface and limit traffic in accordance with Subsection 410.11.
Wait at least 72 hours between application of the layers when using a cutback asphalt, and 24 hours when using an emulsified asphalt. No wait is necessary when using asphalt cement.

410.13 Acceptance. Asphalt cement, emulsified asphalt, and cutback asphalt will be evaluated for acceptance under Subsection 106.05.

Asphalt treatment aggregate and blotter will be evaluated for acceptance under Subsection 105.03.

Provide the minimum number of samples and tests specified in table 410-4, in accordance with Section 160.

Measurement

410.14 Method. Use the method of measurement that is DESIGNATED IN THE SCHEDULE OF ITEMS.

Water used for diluting emulsified asphalt will not be included in the quantity for PAY ITEM 410(04), and will not be paid for separately.

Payment

410.15 Basis. The accepted quantities will be paid for at the contract unit price for each PAY ITEM DESIGNATED IN THE SCHEDULE OF ITEMS.

Payment will be made under:

a. Use in work is permitted prior to sampling and testing for conformance.
b. See Subsection 105.06. Testing not required when using Government-provided material source.
c. An undeveloped source is a source that has not supplied surface treatment aggregate within 365 days of the start of producing surface treatment aggregate for this project.
d. Applies to each aggregate grade furnished.
e. Use only for gravel sources.
Section 411—Miscellaneous Asphalt Pavement Seals

Description

411.01 Work. Apply pavement sealing material(s) or rejuvenator to pavement surfaces SHOWN ON THE DRAWINGS. The pavement seal may require blotter or color treatment as SHOWN ON THE DRAWINGS. Have the surface approved by the CO in writing prior to placing the miscellaneous asphalt pavement seal.

Materials

411.02 Requirements. Meet the following requirements for materials:

(a) Seal Material. As the primary component of the pavement seal material, use slow-setting asphalt emulsion that conforms to AASHTO M 140 or M 208. Submit a manufacturer’s Certificate of Compliance with each shipment of asphalt emulsion. Mix asphalt emulsions with additives that prevent bleeding. Seal materials may be diluted with water to improve penetration into the pavement surface or to improve consistency.

(b) Rejuvenation Material. Dilute rejuvenation materials by two parts concentrate to one part water. Ensure that the concentrate meets the requirements specified in table 411-1.

(c) Additive Materials. Materials such as clays, slates, fibers, carbon black, and polymers may be added to emulsified asphalt, provided that the manufacturer’s product literature is reviewed and approved by the CO prior to application. If the pavement seal material is blended with sand, use sand that has clean, hard, durable, uncoated particles, and is free of clay lumps and organic matter, with 100 percent passing the 600-µm sieve and a maximum of 5 percent passing the 75-µm sieve. The sand must have a gradation that helps control segregation and promotes suspension during product application. Do not add more than 360 g of sand to each liter of applied material.

(d) Color Treatment. When SHOWN ON THE DRAWINGS, use color treatments. Carefully mix and apply color additives according with the manufacturer’s instructions, so that a consistent color and durable seal are obtained. Asphacolor is the only known material to meet these requirements. If other products are proposed, provide manufacturer’s literature that shows similar color, consistency, and durability characteristics.

a. For the ASTM D 244 modified evaporation test for percent of residue, heat a 50-g sample to 149 °C until foaming ceases, then cool immediately and calculate results.
b. Use test procedure identical to ASTM D 244–60, but use .02 percent normal calcium chloride solution in place of distilled water.
c. Use test procedure identical to ASTM D 244, but use distilled water in place of 2 percent sodium oleate solution.

(e) Blotter. Meet the requirements specified in Subsection 703.12.

(f) Water. Meet the requirements specified in Subsection 725.01.

411.03 Sampling. When directed by the CO, sample materials that are used in the work. Give the CO the opportunity to witness sampling. The CO will be responsible for testing.

Construction

411.04 Weather Limitations. Apply asphalt pavement seals only when the ambient air and surface temperatures are above 10 °C and rising, when the weather is not foggy or rainy, and when rain is not forecast for at least 24 hours after application.
**411.05 Equipment.** For all materials, use the distribution equipment that is capable of placing a uniform consistency of the material and enabling a uniform application over variable widths of surface. The required application rate may be obtained by making multiple applications. Use equipment for storing and applying of liquid and slurry products that include accurate volume measuring devices and a calibrated tank. The CO may require transport or application equipment to be weighed when full and when empty, if volume-measuring equipment is inadequate.

**411.06 Preparation of Surface.** Prior to placing the pavement seal, ensure that the surface of the pavement is clean and free from dust, dirt, or other loose foreign matter, grease, oil, or any type of objectionable surface film. Accumulations of oil or grease may be removed by pressure washing, grinding, or burning and scraping. Remove existing painted stripes if SHOWN ON THE DRAWINGS.

Clean all cracks wider than 3 mm by removing accumulated dirt and vegetation, and blow the cracks out with compressed air to a depth of at least three times the crack width. Fill transverse cracks that are more than 3 mm wide according to Subsections 414.04 and 414.05. Other cracks that are more than 3 mm wide may be filled with pavement seal materials prior to application of seal materials over the entire surface.

**411.07 Pavement Seal Application With or Without Color Treatment.** Application may be by hand-held spray equipment, asphalt distributor, squeegee, or slurry seal spreader box. Spread the seal material in two directions, 180° from each other. The CO may require an additional application on small areas of pavement that have more surface voids, where voids have prevented adequate coverage, or where uneven application exists.

Obtain the minimum residue application rate of 0.55 kg/m² over the entire surface to be treated. Ensure that residue consists of the asphalt cement portion of the emulsified asphalt and nonevaporative additive materials (such as clays, slates, fibers, polymers, and sand) that are suspended in the emulsion when applied. Application rates may be adjusted up or down by 0.08 kg residue per square meter by the CO to compensate for pavement surface absorption and roughness.

Readily determine the volume of emulsion used prior to, during, and after application. Final payment will be based on meeting the specified application rate of residue. The CO will determine the weight of residue per liter by drying field samples from the project to constant weight.

**411.08 Blotter Application.** When blotter is included as a PAY ITEM, apply it at 5 kg/m² to areas SHOWN ON THE DRAWINGS. Complete the application within 24 hours of the emulsified asphalt application. The CO may require redistribution of blotter during the first 3 days of the pavement seal curing period.
411.09 **Rejuvenator Application.** Apply diluted rejuvenator at a rate between 0.2 and 0.4 L/m². The exact rate will be determined by the CO. Two hours after application, blot the treated surface with 0.5 to 1.5 kg of blotter sand per square meter. Allow the required cure time of 24 to 48 hours before brooming the sand from the surface.

411.10 **Surface Maintenance.** Prevent asphalt pickup under traffic for 4 days after treatment. Open the treated pavement surface to traffic within 24 hours following treatment. When directed by the CO, apply blotter sand to the sealed pavement to prevent asphalt pickup by vehicles. The CO may require removal of loose blotter by brooming after the maintenance period. After the treatment has been open to traffic for 4 days, repair any areas that are damaged by traffic or that are peeling or cracking. All damage repair is the responsibility of the Contractor.

411.11 **Acceptance.** Acceptance for pavement seal with or without color will be as follows:

If laboratory-quality assurance tests on samples taken during application do not contain enough residue to meet the specified application rates established by the CO in Subsection 411.07, the CO may require the application of more material or may reduce payment. The following factors will be used to determine whether the specified application rate has been obtained:

(a) The average unit weight of the field samples, determined by weighing 1,000 mL to within ± 0.1 g.

(b) The percent residue per liter on a by-weight basis.

(c) The total volume of product applied.

The rejuvenator will be evaluated for acceptance under Subsection 106.05.

Blotter will be evaluated for acceptance under Subsection 105.03.

**Measurement**

411.12 **Method.** Use the method of measurement that is DESIGNATED IN THE SCHEDULE OF ITEMS.

Water used for diluting the pavement seal or rejuvenator will not be included in the quantity for PAY ITEMS 411(01), 411(02), or 411(04), and will not be paid for separately.
Payment

411.13 Basis. The accepted quantities will be paid for at the contract unit price for the PAY ITEM DESIGNATED IN THE SCHEDULE OF ITEMS.

Payment will be made under:

Section 413—Asphalt Pavement Milling

Description

413.01 Work. Remove asphalt pavement using a cold milling process.

Construction Requirements

413.02 Equipment—Milling Machine. Furnish equipment in good working order and with the following capabilities and features:

(a) Self-propelled.

(b) Sufficient power, traction, and stability to accurately maintain depth of cut.

(c) Capable of removing the pavement thickness to provide profile and cross slope.

(d) Automatic system to control grade elevations by referencing from the existing pavement by means of a ski or matching shoe or from an independent grade control.

(e) Automatic system to maintain cross slope.

(f) System to effectively limit dust and other particulate matter from escaping removal operations.

(g) Loading system or adequate support equipment to completely recover milled material at removal rate.

(h) Cutting width equal to at least one-third of the lane width.

413.03 Milling. Use a longitudinal reference to accurately guide the machine. References may include a curb, the edge of pavement, or a string attached to the pavement surface. Mill in a longitudinal direction to the depth SHOWN ON THE DRAWINGS.

Mill the transverse slope to within 6 mm in 3 m of the required slope. Transition from one transverse slope to another at a uniform rate. Uniformly mill the entire roadway lane width so the cross section of the new surface forms a straight line.
Transition between different depths of cut at a uniform rate of 17 mm of depth per 10 m. At the beginning and end of the milling work, construct a smooth transition to the original surface at this rate. Do not leave an exposed vertical edge perpendicular to the direction of travel.

Mill the surface to a smoothness such that a 3-m metal straightedge, measured at right angle and parallel to the centerline, does not have more than a 7-mm surface deviation between any two contact points.

Use a rotary broom and vacuum immediately behind the milling operations to remove and completely recover all loose material. Minimize the escape of dust into the air. Dispose of recovered milled material in accordance with Subsection 202.04(a) or as SHOWN ON THE DRAWINGS.

**413.04 Acceptance.** Asphalt pavement milling will be evaluated for acceptance based on visual and measured conformance based upon contract requirements and customary construction tolerances.

**Measurement**

**413.05 Method.** Use the method of measurement that is DESIGNATED IN THE SCHEDULE OF ITEMS.

**Payment**

**413.06 Basis.** The accepted quantities will be paid for at the contract unit price for each PAY ITEM DESIGNATED IN THE SCHEDULE OF ITEMS.

Payment will be made under:

Section 414—Asphalt Pavement Joint & Crack Treatments

Description

414.01 Work. Cut or rout open cracks. Clean and either seal or fill joints and cracks in asphalt pavement. Joint sealant classes are designated in Subsection 414.02.

Materials

414.02 Requirements. Ensure that material conforms to specifications in the following subsections:

- Asphalt Cement ............................................................. 702.01
- Backer Rod ................................................................. 712.01(g)
- Blotter ............................................................................ 703.12
- Crack Fillers ................................................................. 712.01(a)(3) and (4)
- Emulsified Asphalt ...................................................... 702.03
- Fine Aggregate for Portland Cement Concrete ............. 703.01
- Joint Sealant, Class 1 ................................................... 712.01(a)(1)
- Joint Sealant, Class 2 ................................................... 712.01(a)(2)
- Joint Sealant, Class 3 ................................................... 712.01(f)
- Slurry Seal ..................................................................... 409.02 and 409.03

Construction

414.03 Equipment. Furnish equipment with the features and capabilities shown below:

(a) Power Saw & Blades. A saw and blades of such size and configuration that saw cuts can be made with one pass to the required depth and width. Spacers are not allowed.

(b) Router. A power rotary impact router or vertical spindle router capable of cleaning cracks or joints to the required depth and width.

(c) Hot-Compressed Air Lance. A lance capable of providing clean, oil-free compressed air at a volume of 2.8 m³/min, at a pressure of 830 kPa, and at a temperature of 1,000 °C.

(d) Application Wand. A crack sealant applicator wand attached to a heated hose that is attached to a heated sealant chamber.

(e) Heating Kettle. An indirect-heating-type double boiler with the space between the inner and outer shells filled with oil or other heat transfer medium capable of constant agitation and able to maintain the temperature of the sealant within manufacturer’s
tolerances. Provide an accurate and calibrated thermometer with a range from 100 °C to 300 °C in 2 °C graduations. Locate the thermometer such that the temperature of the joint sealant may be safely checked.

(f) **Squeegee.** Provide a hand-held squeegee for ensuring that the crack is filled to the existing surface.

**414.04 Joint Cutting & Cleaning.** Saw cut or rout, clean, and seal joints in a continuous operation. Either dry or wet cutting is allowed. The depth and width of joint cutting will be as SHOWN ON THE DRAWINGS.

Clean dry-sawed joints with a stream of air sufficient to remove all dirt, dust, or deleterious matter adhering to the joint walls or remaining in the joint cavity. Blow or brush dry material off the pavement surface.

Immediately after sawing, clean wet-sawed joints with a water blast, 350 kPa minimum, to remove any sawing slurry, dirt, or deleterious matter adhering to the joint walls or remaining in the joint cavity. Immediately flush all sawing slurry from the pavement surface. Blow wet-sawed joints with air to dry joint surfaces.

Do not allow traffic to knead together or damage the sawed joints. If cleaning operations cause interference with traffic, provide protective screening.

**414.05 Joint Cleaning & Sealing.** If necessary, clean the joint according to Subsection 414.06. Place the sealant when the pavement surface temperature is 4 °C and rising. Discontinue operations when weather conditions detrimentally affect the quality of forming joints and applying sealant.

Submit a copy of, and adhere to, the manufacturer’s recommendations for heating and applying the sealant. Heat the sealant in a heating kettle. Do not heat the sealant above the safe heating temperature recommended by the manufacturer. Do not hold the material at the pouring temperature for more than 6 hours, and do not reheat the material.

Place a backer rod in the bottom of the cut or routed joint. Ensure that the size of the backer rod conforms to table 712-2.

Seal the joints with an applicator wand when the sealant material is at the pouring temperature. Heat or insulate the applicator wand to maintain the pouring temperature of the sealant during placing operation. Return the applicator wand to the machine and recirculate the joint sealant material immediately after sealing each joint.

Immediately screed the joint sealant to the elevation of the existing surface. Use a squeegee to ensure that a 75-mm-wide band is centered on the finished sealed crack.
Wait for the sealant to be tack free before opening the joint to traffic. Do not spread blotter on the sealed joints to allow early opening to traffic.

**414.06 Crack Cleaning & Filling.** Clean the existing surface of all loose material, dirt, or other deleterious substances by brooming, flushing with water, or other approved methods. Dry cracks before sealing.

When using the hot-compressed air lance, keep it moving so as not to burn the surrounding pavement and the crack. Place and finish sealant within 5 minutes after heating with the hot-compressed air lance.

For cracks 6 mm or less, fill with CSS–1, SS–1, or crack filler. Submit a copy of, and adhere to, the manufacturer’s recommendations for heating and applying the crack filler. Use a squeegee to ensure that a 75-mm-wide band is centered on the finished sealed crack. Cover the sealed crack with a light application of blotter.

For cracks with a width greater than 6 mm and less than 25 mm, fill with either a slurry seal mixture, fine aggregate-asphalt cement mixture, or fine aggregate–emulsified asphalt mixture. Have the mixture approved by the CO. Use a squeegee or other suitable equipment to force the mixture into the cracks. Immediately screed the sealant or asphalt mixture to the elevation of the existing surface. Cover the sealed crack with a light application of blotter.

For cracks with a width greater than 25 mm, fill flush to the existing surface with either hot or cold asphalt concrete mix. Have the mixture approved by the CO.

**414.07 Resealing Defective Joints or Cracks.** Reseal areas that exhibit adhesion failure, damage, missed areas, foreign objects in the sealant, or other problems that will accelerate failure.

**414.08 Acceptance.** Material for joint sealant and crack filler will be evaluated under Subsection 106.05.

**Measurement**

**414.09 Method.** Use the method of measurement that is DESIGNATED IN THE SCHEDULE OF ITEMS.

**Payment**

**414.10 Basis.** The accepted quantities will be paid for at the contract unit price for each PAY ITEM DESIGNATED IN THE SCHEDULE OF ITEMS.
Payment will be made under:

Section 415—Paving Geotextiles

Description

415.01 Work. Furnish and place a paving geotextile and asphalt sealant between pavement layers to form a waterproofing and stress-relieving membrane within the pavement structure. Have the surface approved by the CO in writing prior to placing the asphalt sealant and paving geotextile.

Materials

415.02 Requirements. Provide material that conforms to specifications in the following subsections:

- Asphalt Cement .......................................................... 702.01
- Choker Aggregate .......................................................... 703.12
- Emulsified Asphalt ....................................................... 702.03
- Geotextiles, Type VI ..................................................... 714.01

Construction

415.03 Surface Preparation. Clean the surface on which the geotextile is to be placed using a power broom and/or power blower. Fill cracks that exceed 6 mm according to Subsection 414.06. Allow crack filler and patches to cure before placing the geotextile. Remove all foreign and loose material.

415.04 Weather Limitations. Apply asphalt sealant and paving geotextile on a dry surface when the pavement surface temperature is at least 13 °C and rising.

415.05 Asphalt Sealant Application. Use asphalt cements within a temperature range of 140 °C to 165 °C. Use emulsified asphalts within a temperature range of 55 °C to 70 °C.

Apply the asphalt sealant to the pavement surface in accordance with Subsection 410.08 at a rate of 0.90 to 1.35 L/m² for asphalt cement and 1.3 to 2.0 L/m² for emulsified asphalt.

Spray the asphalt sealant 150 mm wider than the paving geotextile. Do not apply the asphalt sealant any farther in advance of the paving geotextile placement than can be maintained free of traffic.
Where emulsified asphalt is used, allow the emulsion to completely break before placing the paving geotextile.

Where asphalt cement is used, place the paving geotextile immediately after the asphalt cement is applied.

415.06 Paving Geotextile Placement. Place the paving geotextile onto the asphalt sealant with minimal wrinkling. Slit, lay flat, and tack all wrinkles or folds higher than 25 mm. Broom and/or roll the paving geotextile to maximize fabric contact with the pavement surface.

At geotextile joints, overlap the geotextile 150 mm to ensure full closure. Overlap transverse joints in the direction of paving to prevent edge pickup by the paver. Apply additional asphalt sealant to paving geotextile overlaps to ensure proper bonding of the double fabric layer.

If asphalt sealant bleeds through the fabric, treat the affected areas with choker aggregate. Minimize traffic on the geotextile. If circumstances require traffic on the membrane, apply choker aggregate and place signs that read “Slippery When Wet.” Broom the excess choke from the geotextile surface before placing the overlay. Repair all damaged fabric before placing the overlay. Apply a light tack coat in accordance with Section 407 before placing the overlay. To avoid damaging the geotextile, do not turn equipment on the geotextile.

Place a hot asphalt concrete overlay within 48 hours after placing the paving geotextile. Limit the laydown temperature of the mix to a maximum of 165 °C, except when the paving geotextile is composed of polypropylene fibers. In this case, limit the laydown temperature of the mix to a maximum of 150 °C.

415.07 Acceptance. Asphalt cement and emulsified asphalt will be evaluated for acceptance under Subsection 106.05.

Blotter will be evaluated for acceptance under Subsection 105.03.

Paving geotextile material will be evaluated for acceptance under Subsection 714.01.

Provide the minimum number of samples specified in table 410-4.

Measurement

415.08 Method. Use the method of measurement that is DESIGNATED IN THE SCHEDULE OF ITEMS.
Section 415

Payment

415.09 Basis. The accepted quantities will be paid for at the contract unit price for each PAY ITEM DESIGNATED IN THE SCHEDULE OF ITEMS.

</table>
Section 416—Asphalt Pavement Patching

Description

416.01 Work. Perform deep patching, skin patching of asphalt surfaces, and patching of asphalt berms. Prepare the area to be patched, and furnish and place all necessary materials.

Materials

416.02 Requirements. Ensure that asphalt materials are of the type and grade SHOWN ON THE DRAWINGS, and that they meet the requirements specified in the following subsections:

- Asphalt Cement ................................................................. 702.01
- Cutback Asphalt .................................................................. 702.02
- Emulsified Asphalt ............................................................... 702.03

Ensure that mixing temperatures meet the requirements specified in Subsection 702.04; that aggregates meet the requirements specified in Subsection 703.07, except for gradation; and that fabric meets the requirements specified in Subsection 714.01.

416.03 Job-Mix Formula. Prior to producing asphalt concrete mixtures, submit in writing a proposed job-mix formula and supporting documentation for each mixture to the CO for use in setting the job-mix formula to be used with the proposed materials.

After reviewing the proposed job-mix formula, the CO will determine the final values for the job-mix formula to be used and notify the Contractor in writing.

Construction

416.04 Deep Patching. Remove surface course and base course materials above the subgrade to a minimum depth of 50 mm, or as necessary to reach firm support. If firm support for a patch is unavailable, notify the CO prior to placing any material.

Trim or mill the edges of the prepared hole to form a vertical face in unfractured asphalt surfacing. Make the prepared hole rectangular in shape, and clean it of all loose material. When the hole is dry, spray the bottom and faces with an emulsified asphalt.

Immediately patch or barricade prepared sites.
Place the asphalt concrete mixture in layers not exceeding 100 mm. Thoroughly compact each layer with hand or mechanical tampers or rollers.

Compact the finished surface with a steel-wheel roller or vibratory plate compactor. For hot asphalt concrete mixtures, compact the mix while it is above 110 °C. Ensure that the compacted patch, upon completion, is approximately 3 to 6 mm above the level of the adjacent pavement. Seal the edges of the completed patch with emulsified asphalt, and blot with fine sand.

When SHOWN ON THE DRAWINGS and DESIGNATED IN THE SCHEDULE OF ITEMS, use a geotextile saturated with rubberized asphalt to strengthen the pothole area. Ensure that the geotextile has a minimum grab strength of 90 N. Prepare the surface on which the fabric is placed by digging out and patching as described above, or by cleaning the surface, removing vegetation, and filling all cracks more than 6 mm wide with an approved crack-filling material. Remove excess crack-filling material.

Place the fabric membrane over the repaired area. Extend the fabric a minimum of 150 mm beyond the repaired or patched area onto sound adjoining pavement. Use a minimum of 50 mm overlap where adjacent fabric panels are needed to cover the repaired area.

**416.05 Skin Patches.** Prior to skin patching, patch all potholes.

Treat minor depressions, light raveling, or surface checking at scattered locations SHOWN ON THE DRAWINGS or marked on the ground by applying a skin patch.

Prior to skin patching, clean the surface of loose and deleterious material, and spray it with emulsified asphalt at the rate ordered by the CO. Do not place mixture until authorized by the CO.

Uniformly distribute asphalt concrete mixture in layers not to exceed 50 mm compacted depth. Feather the edges of skin patches. When multiple layers are necessary, offset all joints at least 150 mm between layers.

Compact each layer with a 7- to 9-t steel roller. For hot asphalt concrete mixtures, compact the mix while it is above 110 °C.

Ensure that the completed patch does not have abrupt transitions that could adversely affect the steering of a passenger car traveling across the area. Provide transition tapers for skin patches that are 100 mm per 1 mm thickness of patch in the direction on travel.

**416.06 Asphalt Berm.** Remove damaged segments of berm and bevel exposed ends at approximately 45° from vertical. Clean and patch the berm foundation as
necessary. Coat the foundation and joining surfaces with emulsified asphalt. Place and compact asphalt mix to conform with the shape of the undamaged segment.

**416.07 Waste Material.** Dispose of all materials removed from potholes, patches, and berms in accordance with Subsection 202.04(a).

**Measurement**

**416.08 Method.** Use the method of measurement that is DESIGNATED IN THE SCHEDULE OF ITEMS.

**Payment**

**416.09 Basis.** The accepted quantities will be paid for at the contract unit price DESIGNATED IN THE SCHEDULE OF ITEMS.

Payment will be made under:
