

# BENEFITS TO PEOPLE

## At a Glance Report

### Land Between the Lakes National Recreation Area

#### Why are forests and grasslands important?

National recreation areas provide public benefits (also known as ecosystem services) such as timber, clean air and water, forage, and energy production. National Forest System lands also provide recreation, cultural and heritage opportunities that play an important role in how communities come together for physical and mental health, family, and to connect to the land. In many rural areas, the infrastructure, employment, goods and services provided are a basis for the structure of the community. The purpose of this report is to explain the benefits to people of National Forest System lands and complement the [Jobs & Income At a Glance Reports](#)<sup>1</sup>. This is a brief snapshot of Land Between the Lakes National Recreation Area benefits using national data sets. The reader is encouraged to explore more detailed information from their local Forest Service office, the [Benefits to People StoryMap](#), and at the [national recreation area's website](#)<sup>2</sup>.

#### Setting

The map on the left shows the Land Between the Lakes National Recreation Area. The surrounding area is included to demonstrate the wider area of potential benefit outside the national recreation area. Two of the three counties overlapping the national recreation area's boundaries are non-metro containing less than 50,000 residents. On the Land Between the Lakes National Recreation Area, the largest land use type<sup>3</sup> is forest (91%), of which 100% is timberland and 0% is reserved. Nonforest (9%) and water (0.0%) are the other land use types.

<sup>1</sup> Jobs & Income At a Glance Reports can be found at <https://www.fs.fed.us/emc/economics/contributions/at-a-glance.shtml>  
<sup>2</sup> Find the Land Between the Lakes National Recreation Area website at <http://www.lbl.org/>  
<sup>3</sup> Forest land use is defined as land that is at least 10% stocked by forest trees of any size, or land formerly having such tree cover, and not currently developed for a nonforest use. Timberland is forest land that is producing or capable of producing in excess of 20 cubic feet per acre per year of wood at culmination of mean annual increment. Reserve forest land is permanently reserved from wood products utilization through statute or administrative designation. Nonforest land is land that does not support or has never supported, forests and lands formerly forested where use of timber management is precluded by development for other uses

## Partnerships

National forests and grasslands provide a venue for communities to build relationships with land management agencies, state and local governments, other organizations and with each other. Building relationships and partnerships makes communities more resilient to change and improves their ability to adapt to challenge and change.

Partnerships and stewardship agreements are examples of the Forest Service building community relationships.

In 2017, the Land Between the Lakes National Recreation Area had 24 partners under open agreements.

## Recreation Opportunities & Scenery

The top activities for approximately 740,000 visitors to the Land Between the Lakes National Recreation Area are fishing, viewing natural features, and horse ride. For a list of the recreation sites on the recreation area, visit the [Benefits to People StoryMap](#) and at the [national recreation area's website](#)<sup>4</sup>.

Recreationists, outfitters, and guides benefit directly from National Forest System land while local businesses benefit from spending by recreation area visitors. Total spending by visitors to the Land Between the Lakes National Recreation Area is about \$48.5 million annually.

Visits to the recreation area related to wildlife (hunting, fishing and wildlife viewing) was 41% of total visits. These people benefit from healthy ecosystems that contribute to wildlife related recreation.

Landscapes and features of the Land Between the Lakes National Recreation Area provide scenic resources appreciated by local residents, recreationists, artists, people seeking inspiration and other visitors. In addition, scenery on the Land Between the Lakes National Recreation Area contributes to community identity, a sense of place, quality of life, the tourism industry, and supports property values.

## Cultural & Heritage Resources

The cultural and sacred features of National Forest System landscapes provide people an understanding of their place in natural and cultural environments. By providing access and integrity of heritage sites, the recreation area provides connections to the land of ancestors, a sense of place, opportunities for interpretive learning, and fosters traditional uses. The Forest Service also manages and protects paleontological resources for scientific and educational purposes.

## Research and Education

National Forest System lands provide opportunities to advance scientific knowledge and transfer that knowledge used to learning and educational activities. For example, the recreation area had about 425,000 audience members for conservation education programs.

## Access

Locals and visitors benefit from access to the recreation area and its resources. There are 462 miles of roads and 341 miles of trails on the Land Between the Lakes National Recreation Area, providing access for recreation, subsistence, and other resource uses.

## Tradeoffs

Managing National Forest System lands often results in changes to ecosystems, resources, or benefits. These tradeoffs in benefits are important to consider in the context of all benefits provided by forests and grasslands. For example, use of forest lands for timber product benefits may imply tradeoffs in benefits to recreation and other uses that benefit from standing timber. Understanding benefits to people helps clarify the implications of these tradeoffs.

## Forest Products

Many rural communities have depended on the timber industry to support their livelihoods, culture and heritage. Outside these communities, forest products are widely used in construction. Timber harvest is sometimes done as a means of forest restoration, improving habitat, ability to store carbon, and resilience to wildfire, disease, and invasive species. Opportunities to collect fuelwood on National Forest System lands supports family traditions and provides an affordable fuel source for households that depend on wood heating. 391,600 cubic feet of Sawtimber, 3,700 cubic feet of commercial fuelwood, and 261,700 cubic feet of pulp, posts/poles and other wood products were harvested from the recreation area in 2015. Other forest products, such as mushrooms, berries, boughs and plants, provide medicinal benefits, subsistence, and recreational activities.

## Water & Air

National Forest System lands play a critical role in protecting the nation's water resources. People and animals that live in and downstream from the recreation area rely on this resource. People that recreate on or depend on these lands for their livelihood, such as farmers, fisherman, and recreation guides, benefit from this water as well. The Environmental Protection Agency designates protected areas where public water systems draw their drinking water from surface and groundwater supplies. Water goes to about 87,000 people served by protected areas overlapping the recreation area by at least 25% (at the subwatershed scale). In the larger area, water from all ownerships supplies additional uses, including 15% for municipal use, 23% for agriculture, 7% for industry and mining uses, and 55% for other uses such as aquaculture and thermoelectric needs.

National forests play a critical role in protecting the nation's air resources: not only for the people and animals that live within the national recreation area but also for those off National Forest System Lands. Trees and other vegetation on the Land Between the Lakes National Recreation Area provide air through respiration and capture common air pollutants.

## Minerals & Energy

National Forest System lands provide access for commercial development of a variety of mineral resources. This includes locatable minerals (such as silver and gold), saleable minerals (such as stone, sand and gravel) and leasable minerals (such as coal, oil and gas). People benefit from opportunities for recreational mineral collection on these lands through panning, dredging, sluice-box and metal detector use.

## Other Benefits

Additional benefits, like wilderness character, provide intangible and spiritual values to society that the Wilderness Act describes as the benefits of an enduring resource. Wilderness is a benefit for people that value preservation, untrammeled areas, wildlife habitat, and solitude. Additional benefits of recreation areas include values not associated with use, the option to use the land and resources in the future, and to pass on the benefits to future generations. For example, people benefit from knowing that wildlife habitat and wildfire resilience will exist in the future and that they can pass on these benefits to future generations.

## Additional Information

[Headwaters Economics](#)<sup>5</sup> maintains area profiles that can be consulted for a deeper dive into the social and economic characteristics of the area; including important information for consideration of Civil Rights and outreach and effects to Environmental Justice populations.

See the [Jobs & Income At a Glance Reports](#)<sup>6</sup> for more information on the economic contributions of recreation area activities and the [Benefits to People StoryMap](#) for a geographical and more comprehensive representation of recreation area benefits.
