

# St. Joe Geographic Area

## Sensitive Landtype Associations

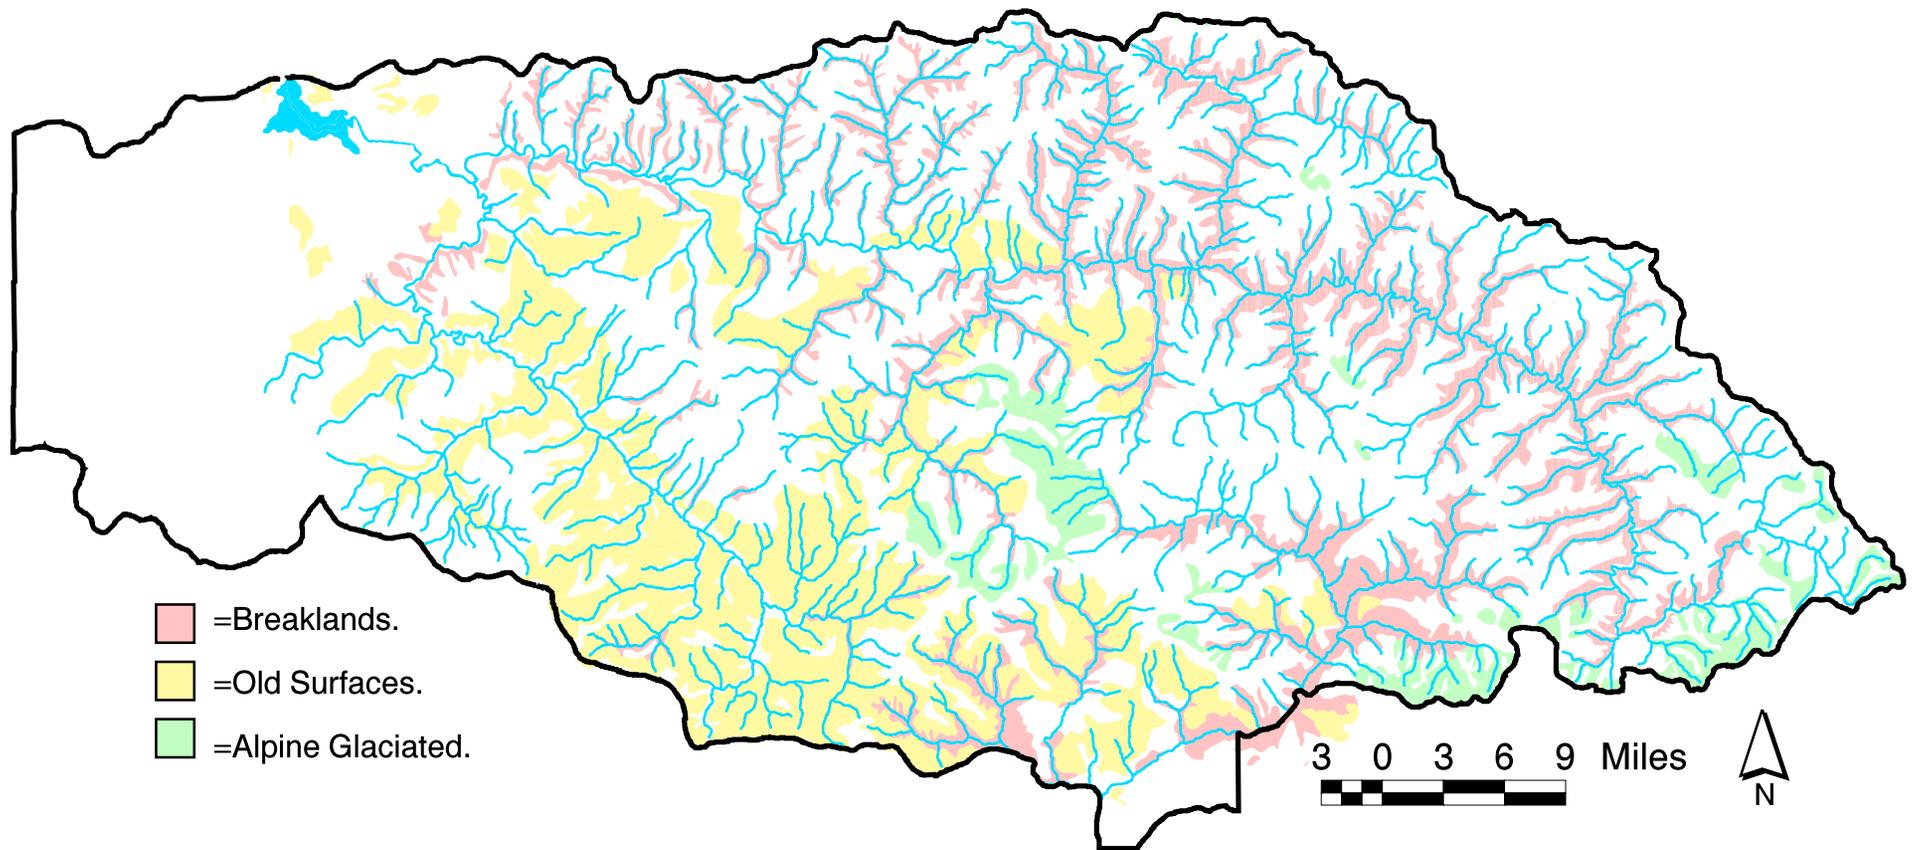

Figure 6. The St. Joe Geographic area contains many landtype associations including alluvial, breakland, glaciated, frost churned, old surfaces, and mass wasting. Three groups with important characteristics are:

- \* Breaklands which include areas with sediment delivery and/or mass failure hazard.
- \* Old Surfaces of Schist, Tertiary, Granitic, or Belt material with sediment delivery and mass failure hazard.
- \* Steep Alpine Glaciated areas with sediment delivery and some mass failure hazard.
