Federal directives including the National Seed Strategy, the President’s Memorandum on pollinators, and greater sage-grouse conservation plans emphasize the use of native species to recover ecosystems damaged by fire, mineral extraction, energy development, recreation, road construction, or other disturbances. Forbs or wildflowers are essential components of resilient, biologically and functionally diverse communities. However, restoration and rehabilitation use of native forbs in the Intermountain West remains limited. Because of this, *Western Forbs: Biology, Ecology, and Use in Restoration* is being developed to synthesize native forb research, particularly the many studies conducted over the last two decades, and knowledge gained from practical experience. This document will aid seed collectors, seed growers, nurserymen, landowners, restoration contractors, and public land managers as they increase the supply and use of native forbs in the Intermountain West. Each chapter focuses on an individual forb species and reviews current knowledge of its biology, ecology, seed technology, and use in restoration. Eventually the manual will include at least 98 forb species. Chapters are being developed in order of priority set by USDI Bureau of Land Management personnel, based on the projected importance of each species for Great Basin sites in the greatest need of restoration.

**Acknowledgements**

This manual could not be developed without the help and cooperation of many individuals, agencies and organizations. Funding and support for the *Western forbs: Biology, Ecology, and Use in Restoration* project is provided by the USDI Bureau of Land Management, Great Basin Native Plant Materials Ecoregional Program, and the efforts of Anne Halford, BLM, Idaho State Botanist.

Many others have provided much needed and appreciated assistance as well. We are grateful to: Matt Fisk, USGS, for GIS and mapping support; Kayla Herriman, USFS, Bend Seed Extractory, for seed cleaning data and reports; Rachel Hosna, BLM Seeds of Success, for seed collecting data; Génie Montblanc, Great Basin Fire Science Exchange Coordinator, for administrative support; Jake Soper, Evermore Prints, for chapter design and layout. We also thank the USFS, Rocky Mountain Research Station, Fire Effects
Information System, for use of their thoroughly key worded citation database (Citation Retrieval System). Please see also the Acknowledgements section in each of the species chapters completed for this project, where chapter reviewers and other contributors are noted.
